![Setup Contamination Check Tab](image2)

6. Use the appropriate reference spectra for both the Contamination Check as well as the Throughput check, located in the following folder:
For the UATR sample attachment use:
C:\pel_data\Ready Checks\Reference Spectra\  
For the sample slide attachment use:
C:\pel_data\Ready Checks\Reference Spectra\  

7. The "Setup Noise Check" tab shows the parameters for the test.

![Setup Noise Check Tab](image3)

8. The "Setup Abscissa Check" tab shows the parameters for the test.

![Setup Abscissa Check Tab](image4)

10. Ready Check Interpretation:
   a. Printouts of the Ready Check will be kept in the Fourier Transform Infrared Spectrometer Maintenance Binder. (ISO/IEC 17025:2005 5.5.5 h)
   b. Abscissa
      i. This report uses the Internal Automatic Performance Valuator (Internal APV) polystyrene film to check the wavelength of known peaks at approximately 3060, 1601 and 1028 cm\(^{-1}\).
      ii. The frequency should not vary more than the range given below.

   \[
   \begin{array}{|c|c|c|}
   \hline
   \text{Nominal cm}^{-1} & \text{Lower Limit (cm}^{-1}\text{)} & \text{Upper Limit (cm}^{-1}\text{)} \\
   \hline
   3060 & 3058 & 3062 \\
   1601 & 1598 & 1603 \\
   1028 & 1025 & 1030 \\
   \hline
   \end{array}
   \]

   c. Noise Check
      i. This report generates statistics of the noise in a range between 2600 and 2500 cm\(^{-1}\) of a blank sample.
      ii. The RMS, Peak to Peak, and Trend values are calculated and compared to the following criteria:

   \[
   \begin{array}{|c|c|}
   \hline
   \text{Statistic} & \text{Limit} \\
   \hline
   \text{RMS (%T)} & 1.000 \\
   \text{Peak to Peak (%T)} & 1.000 \\
   \text{Trend (%T/cm}^{-1}\text{)} & 1.000 \\
   \hline
   \end{array}
   \]

d. Throughput Check
   i. This report checks the current background at certain wavelengths.
   ii. The %T is compared with the values obtained from the reference spectra.

   \[
   \begin{array}{|c|c|}
   \hline
   \text{Position (cm}^{-1}\text{)} & \text{Lower Limit (%T)} \\
   \hline
   4000 & 80 \\
   2600 & 80 \\
   1000 & 80 \\
   \hline
   \end{array}
   \]

e. If the above criteria are not met, corrective action shall be taken. As the components in the instrument age, values obtained in the Ready Checks may drift from those obtained when the instrument was first evaluated. Corrective
action may include re-evaluating nominal values used in the above tests or re-obtaining a reference spectrum, see instructions below for obtaining a new reference spectrum.

C. **Every 6 months** (or as needed) change desiccant (ISO/IEC 17025:2005 5.5.3)

1. The desiccant indicator is located on the top of the instrument. Blue indicates that the desiccant has capacity to absorb moisture.
   a. The desiccant can be changed if at least the first "10" section is pink, but the "15" and "20" sections are still blue.
   b. See page 33 and 52 of the Spectrum 100 User's Guide for more information.

2. Every six months, the software will prompt for a change of desiccant. This will be indicated in the status bar. The days remaining can be checked or reset by using the Setup Instrument BeamPath screen.

4. The change of desiccant will be noted in the maintenance log.

D. A check the internal filter wheel polystyrene against an external polystyrene standard that may be NIST traceable will occur every two years. (ISO/IEC 17025:2005 5.5.3, 5.5.5 c, g)

1. The software counter on the FTIR may be used as a reminder for analysts to perform the yearly maintenance on the instrument, but does not invalidate the function of the instrument. Maintenance must be performed within two calendar years.
   a. Place the slide cover attachment in the FTIR
   b. In the Perkin Elmer software, select the Setup Instrument Basic tab.
      i. Select Load and Save
      ii. Switch to Sample Holder and Set As Current, hit OK
   c. Perform the Weekly Maintenance with the slide holder in place
   d. Run the Selected Ready Checks and print and save a copy
   e. Acquire a Background
   f. Load the Polystyrene into the slide holder. The external Polystyrene is kept in the dessicator
      i. Name the sample in the sample log table (ensure to differentiate between external Polystyrene and the internal Polystyrene from the filter wheel). Analyst may also reference the serial number or other unique identifier for the external Polystyrene.
      ii. Select the appropriate folder to save the file
      iii. In the Setup Inst. Beam Path tab, verify the Filter Wheel is set to **None**
   g. Scan the sample to acquire the spectrum
   h. Remove the external Polystyrene Standard, and return to the dessicator
   i. Acquire a new Background
i. Name the sample in the sample log table (ensure to differentiate between external Polystyrene and the internal Polystyrene from the filter wheel).

ii. Select the appropriate folder to save the file

iii. In the Setup Inst. Beam Path tab, Change the Filter Wheel setting from None to Polystyrene

j. Scan the sample to acquire the spectrum

k. Overlay the samples (internal and external Polystyrene specta) and label the peaks
   i. Ensure that 3082, 3060, 1601, 1583 and 1028 are labeled. This may be done by choosing Peak Detection under Set up and choosing to integrate the top peaks and adjust the number of peaks integrated until the required peaks have been labeled.
   ii. Ensure that the labeled peaks on the internal Polystyrene are within +/- 2 wavenumbers of the labeled peaks on the external Polystyrene

l. Print both spectra to demonstrate the internal Polystyrene has been checked against an external Polystyrene reference material

   i. Indicate on the Maintenance log that yearly maintenance was performed
   ii. File the printout in the Maintenance binder

m. Set the Filter Wheel back to None

n. Remove slide cover attachment

o. In the Perkin Elmer software, select the Setup Instrument Basic tab.
   i. Select Load and Save
   ii. Switch to ATR and Set As Current, hit OK

p. Set the time for the next yearly check in the Setup Inst. Beam Path tab, hit the Serviced button to reset the counter and enter 365 days in the Instrument Service Field.

E. **Periodically**, it may be necessary to collect a new reference spectrum to be used for comparison during the contamination and throughput checks. Indications of the need to collect a new reference spectrum include an increase in baseline for the contamination checks when the sample plate is clean. A new reference spectrum should be collected after preventative maintenance to ensure the instrument is as clean as possible.

   1. Load the current settings for the accessory type.
   3. Change the Scan Type to Background.
   4. Name the sample and choose the folder to save the spectrum in.
   5. Select Scan
   6. Under the “Ready Check” setup, select the “Setup Contamination Check” tab.
7. Import the new reference spectrum from the directory.
8. Under the “Ready Check” setup, select the “Setup Throughput Check” tab.
9. Import the new reference spectrum from the directory.
10. Save and rename the current settings for the accessory type (in the same window as step 1).

END OF DOCUMENT
I. Policy: The following is a list of references in relation to the FTIR. These references are available on a CD named Spectrum Manuals L1050002-S 22/12/10.

D. Perkin Elmer website: perkinelmer.com

E. HELP menu on any version of Spectrum Software

END OF DOCUMENT
I. Policy: The following is the policy for controlling software and tracking the version of software in use in the Controlled Substance Unit.

A. Software.

1. The identity (version of software or equivalent) will be logged in the maintenance binder for each piece of equipment. See DRG.17.

2. Manufacturer's technical support personnel, technical personnel contracted by the Laboratory, technical services personnel and approved lab staff may make changes, additions or upgrades to software.

3. If the software is off-the-shelf software, no validation or verification is required. However the tracking of the identity and approval is required.
   a. The control or approval for use should be documented in the maintenance log by the Manager or Supervisor.

4. If the software is "custom" or developed by the user, then documentation of validation or verification is required. See DRG.16 for more information about Software. The tracking of the identity and approval is required.
   a. The control or approval for use should be documented in the maintenance log by the Manager or Supervisor.
   b. Any version of Microsoft Word, Excel or Access, JusticeTrax Indexer, Adobe Reader, Adobe Pro, PDF Creator, Microsoft ActiveSync or JusticeTrax Batch Image Capture is considered to be approved for use.
   c. Rad-Key is software that copies the value from the balance and pastes it into LIMS. Any version is considered approved for use.
   d. Chemstation Macros are present on each GC/MS within the Drug Unit. They are sometimes edited to accommodate any changes in Chemstation software or instrument installed. A log of any changes/edits are kept in the instrument maintenance log.
   e. Digital pictures require the use of software to take or download pictures. Any version of the Ipevo Presenter software is considered approved for use. Any version Paint, Photoshop or equivalent is considered approved for use.
i. Various types of digital devices can be used for pictures. Any software that is provided or recommended by the manufacturer of the device being used is considered approved for use.

f. Only Laboratory staff designated by the Manager or Supervisor should make changes, additions or upgrades to custom or user developed software. The documentation of approval by the Manager or Supervisor on the Software log will be considered as documentation that the Laboratory staff that made the change was designated to do so by the Manager or Supervisor.

5. For more information, see FSD.34.

END OF DOCUMENT
I. Policy: The following is a general description of the guidelines and sample selection plan employed by the analyst in determining the analyses to be performed on a case. The Forensic Manager or Supervisor may direct deviations from the guidelines due to staffing levels or customer needs.

A. Case Examination Protocol

1. Limited laboratory staffing and resources prevent the examination of all confiscated items in each case. Consequently, guidelines have been developed to ensure the efficient and successful case resolution while minimizing unnecessary examinations by laboratory staff members.

2. Because the laboratory testing procedures may not detect uncommon drugs, it is important that any unusual drugs be brought to the attention of the laboratory by noting the name of the suspected drug on the Controlled Substance envelope.

3. If the laboratory does not possess reference materials (Drug Standards), they may be acquired, or suspected samples may be forwarded to a referral or outside laboratory with the appropriate reference materials. The laboratory has controlled substance reference materials from legitimate manufacturers for many drugs (see DRG.05). In addition, some drugs may not be identified due to limitations in equipment. In these instances an outside laboratory will be used.

4. Due to jurisdictional legal requirements, our laboratory utilizes "sample selection" (not sampling) for drug analysis. Thus, the report reflects that only certain items or units were tested.

5. If deviations from our laboratory policy are required by our customer, they must be approved by the Supervisor or Manager and will be documented in the case notes.

6. An agency may indicate to the Laboratory that certain items should NOT be examined, or to ONLY examine certain items. The Laboratory staff may not examine those items and should indicate in the notes and report that those items were not examined per agency instructions. This is not considered a deviation from Laboratory policy.

7. An outside agency (submitting agency or District Attorney's Office) may request deviations from the laboratory plan due to extenuating circumstances or enhancement requirements. The request should be approved by a Manager or Supervisor prior to analysis and the approval will be documented in the case notes.

8. Analysts may also deviate by analyzing more or less than the sampling plan indicates. The approval by the Supervisor or Manager is the Technical Review of the case.
B. Definitions:

1. **Item**: An item is a grouping of suspected controlled substance or related material that are similar in appearance and packaging, and from a single source. An item is comprised of units but can also be a singular if only one unit is present.

2. **Unit**: A unit is a single, individual article of suspected controlled substance. An item may be composed of multiple units that are similar in appearance and packaging and are from a single source.

3. Example: An Agency lists one item (Item #1) on a Controlled Substance Envelope but it actually consists of ten bags of suspected methamphetamine and 8 balloons of suspected heroin. The evidence can be categorized as two items: one item consisting of 10 units (bags) and the second item consisting of eight units (balloons).

C. The following is an overall scheme of how sampling is carried out in a forensic context (Reference: *Guidance for Best Practice Sampling in Forensic Science*, ENFSI, 2007).

```
Sampling Strategy
↓
Population Determination
↓
Sampling Plan
↓
Sampling Protocol
```

1. The **sampling strategy** is routinely based on legislative and legal practices and should be built on the aim of taking into account the investigation, the questions(s) asked and the end use of the results. In this jurisdiction, there is an assumed homogeneity of a substance in a single container (eg. bag) such that if any of the substance tests positive it is assumed that the entire container (or bag) contains the same substance.

2. The **population determination** refers to the number of units and most commonly refers to multiple units. Officers typically itemize evidence and segregate different types of substances into different items (i.e. Item 1 is a white crystal and Item 2 is a green plant material) before submitting to the Laboratory.

   a. If upon opening the evidence, the analyst determines that sufficient segregation has not occurred (i.e. Item 1 consists of green and pink tablets; or 10 bags of crystals and 10 bags of white powder), the analyst may further segregate the items such that units within an item are visually similar to one another for analysis purposes.

      i. Segregation will be done if the item(s) are going to be analyzed and reported. If the laboratory does not further segregate dissimilar items due to manpower or resources the notes and report will reflect that.

   b. While there is some assumption of homogeneity among similar looking items or multiple units within a single item, there is no statistical or scientific certainty. While it is likely that other similar looking items or units contain the same substance as those that were tested it cannot be certain without confirmation.

3. The **sampling plan** can be numerically based or non-numerically based. Our Laboratory uses a non-statistical sampling plan. Non-statistical sampling plans are numerical sampling plans based on non-statistical methods such as management directive or judicial requirements. Our Laboratory is using a sampling plan to determine if a controlled substance is present.
a. For items that are similar in appearance (and from the same individual and/or location) typically 10% of the items are analyzed (i.e. if there are 12 items of marijuana, typically 2 are tested).

b. For a single item that contains multiple units, typically 10% of the units are examined (i.e. if there are 55 bags of cocaine, typically 6 are tested).

4. The sampling protocol is the procedure used for the analysis of items or units. This is the detailed procedure for selecting items/unit for analysis, weighing items/units (when gross weights, net weights or estimates are appropriate) as well as the methods of analysis, reference materials (standards) and equipment used.

D. Sampling Protocol

1. Selection of items or units for analysis:
   a. The offense, number of individuals, weight as well as the location of the item may influence the selection decision.
      i. For a possession case, follow the "Possession" analysis scheme
      ii. For a sales case, follow the "Sales" analysis scheme
      iii. If similar looking items from different locations are submitted, typically the item found on the subject is selected for analysis
      iv. If multiple similar looking items from a similar location or multiple units within a single item are submitted, typically the largest weight item is selected for analysis.
      v. If all items or units appear similar in weight than the items or units selected for analysis is random.
      vi. See below for analysis scheme based on offense
      vii. See DRG.34 for suggested tests and equipment used in analysis.

2. Amount and selection of substance within an item that is used for analysis:
   a. After the sample to be analyzed is weighed, a small amount is selected at random for presumptive chemical analysis.
      i. For solid samples, this is typically between 2-10 milligrams of substance. It may be larger for some substances (i.e. marijuana and mushrooms 10-50 milligrams).
      ii. For liquid samples, this is typically a couple of drops between 0.05-0.10 milliliters of substance. It may be larger for some substances.
   b. A small amount is also selected at random for instrumental confirmation.
      i. For solid samples, this is typically between 5-15 milligrams of solid substance but more substance may be necessary for low concentration samples or pills. Mushrooms use approximately 1 gram for extraction.
      ii. For liquid samples, this is typically a few drops between 0.10-0.20 milliliters. It may be larger for some substances (i.e. Steroids 1-2 milliliters).
   c. If more substance is used to concentrate a weak sample it should be noted in the case notes.
E. Procedure: Possession

1. Offenses:
   a. Possession of a controlled drug: 11350, 11357, 11377
   b. Possession of precursors for the illicit manufacture of drugs: 11383

2. The lab will typically analyze only one item or unit within an item for each suspect.

3. For a possession case, the offense(s) (charge) listed on the request should be met. The extent of analysis is at the discretion of the analyst.
   a. If multiple items are submitted from a single individual, and:
      i. they are similar in appearance, then typically only one will be analyzed.
      ii. they are different in appearance, then both of the items may be identified unless the results of the presumptive tests on the subsequent items are the same as those on the first item. In this case only the first item will be confirmed and the subsequent item(s) may be reported as presumptive positive.
   b. The net weight of the items examined will be reported (if possible).
   c. The gross weight or estimated weight of items not examined may be reported. This is at the discretion of the analyst however, typically estimated weights are given where feasible.
   d. Items, which are in dosage unit form, i.e. tablets, capsules, cigarettes, and paper squares, will not be weighed. However, the total number or estimated total number will be reported.

F. Procedure: Sales

1. Offenses:
   a. Sales of a controlled drug: 11352, 11360, 11375, 11379, 11380
   b. Sales in lieu of a controlled drug: 11382, 11355
   c. Possession for sale of a controlled drug: 11351, 11351.5, 11359, 11378, 11378.5, 11379.2

2. One sample of each different drug submitted will typically be examined.

3. For a sales case, the offense(s) (charge) listed on the request should be met. The extent of analysis is at the discretion of the analyst.

4. Often one of the factors, which indicate that a drug was possessed with the intent to sell, is that the quantity possessed exceeded that which is normally held for personal use.

5. The net weight of any examined items shall be given (where possible). The total estimated weight of all units within the item examined should be given.

6. If a single item consists of multiple units, a representative sample is selected at random, usually one of every ten will be examined.

7. If an item consists of a very large number of units (i.e., 100 or more), then fewer than one in ten will be examined. Typically no more than 10 units within an item are
examined.

8. For multiple item cases, a statement will be included in the laboratory case notes that the unexamined items were similar in appearance as the examined one.

9. If items are packaged in large quantities not ordinarily sold for personal use, then the analysis of one or two items may be necessary.

10. The weight of the items examined will be reported along with the total estimated weight of any remaining items. For any estimated weight, the laboratory will indicate that if uncertainty is required further work may be done. See DRG.11.

11. The laboratory does not have a large capacity balance and items that are physically large (e.g., marijuana plants) or weigh more than 1 kilograms cannot be weighed. If the intent to sell a controlled drug cannot be established through the quantity of drug alone, the laboratory will examine items used in the preparation of drugs for sale for the presence of controlled drugs. Such items include scales, sifters, and measuring devices.

   a. Procedure: Cultivation of a Controlled Substance:
      • Cultivation of marijuana: 11358
      • Cultivation of peyote: 11363

12. The laboratory will examine one item that is similar in appearance for each suspect.

13. The total number of units may be reported because of the variability in weight, which occurs at the various stages of drying. The sample may also be weighed and a weight may be reported (it should be noted in the case notes if dirt/roots/other materials are included in the weight).

14. Items, which have been packaged in plastic before thorough drying, can mold and decay very rapidly. This may alter the ability of the laboratory to identify the plant and may pose a health hazard. Therefore, plants must be submitted dry and/or packaged in a paper bag or a ventilated cardboard box. Large samples that exceed the drying capacity of the laboratory oven shall be returned to the client agency for drying or repackaging before examination.

   a. Below is information about charges and enhancements in California.
METHAMPHETAMINE

SCHEDULE II  11055 (d)(2)

CHARGE

11377   Possession (misd. or 16-2-3)
11378   Possession for Sale (16-2-3)
11379   Sale (transport, import, furnish, administer, give away, or offers...) (2-3-4)
11379.6  Manufacture (process, prepare, etc.) (3-5-7 plus $50,000) (See Filing Guide page (8))
11382   Agrees to sell and then sells another substance in lieu of (misd or 15-2-3)
11383a,c  Possession of precursor chemicals with intent to manufacture (2-4-9) (See 11379.7)
11385a   Possess or use false compartment in vehicle to store or transport (misd. or 16-2-3)
11366,b  Design or construct false compartment in vehicle to store or transport (16-2-3)
11401   Analog of methamphetamine (controlled substance) (i.e. substantially similar chemical structure or effect)
PC 82a1  Conspiracy to do the above (same as substantive charge)
11532   Looting in a public place with intent to commit a narcotic offense (misd.)
PC 1170.74  If Meth in crystalline form, aggravating sentencing factor.

WEIGHT

PC1203.073b2  Two ounces (of substance containing Methamphetamine) or one ounce of pure Methamphetamine (No probation; judge has discretion)
11370.4b1  over One kilogram, or over 30 liters (plus 3 years)
11370.4b2  over Four kilograms, or over 100 liters (plus 5 years)
11370.4a3  over Ten kilograms, or over 200 liters (plus 10 years)
11370.4e4  over Twenty kilograms, or over 400 liters (plus 15 years)
11379.8  if 11379.6 and: > 1 lb/3 gal. (add 5 yrs); > 3 lbs/30 gal. (add 5 yrs); > 10 lbs/25 gal. (add 10 yrs); > 44 lbs/105 gal. (add 15 years)
PC 1170.73  if 11377, 11378, 11378.5, the quantity shall be considered an aggravating sentencing factor
PC 1170.74  if 11377, 11378, 11379, 11379.6 and substance is crystalline form of math, this is sentence aggravation.

PRIORS

11370.2b,c  New 11378, 11379, 11379.6, 11380, 11383 with prior 11351, 11351.5, 11352, 11378, 11378.5, 11379, 11379.5, 11379.6, 11380, 11380.5, 11383 (add 3 yrs for each prior conviction)
PC 1203.07(a)(11)  Any new 11378 or 11379 with prior 11351 or 11379 (No probation; NO discretion)
PC 1203.073(b)6  New 11379.5, 11382, 11383 with prior 11376, 11378, 11379, 11379.6, 11380, 11380.5, 11383 (No probation; judge has discretion)
PC 667.5b  For each prior prison commitment (add one year) (Note: Do not impose for any prison commitment if upon release deft remained free for subsequent 5 years of both further prison and felony conviction)
11366.5c  Prior 11386.5a with new 11366.5a (2-3-4)

FIREFARMS

11550e  11550 while in personal possession (incl. passenger compartment of vehicle) of loaded, operable firearm (misd. or 16-2-3)
11370.1  if 11377 while armed (available for offense/defense) with loaded, operable firearm (2-3-4) (No diversion: no deferred entry of judgement)
PC 12022c  11378, 11379 or 11379.6 (or attempt) while armed (available for offense/defense) with firearm (loaded or unloaded, operable or incapable) (full consecutive 3-4-5) (if vicarious, 12022d (add 1-2-3))
12022a  Armed with firearm (loaded or unloaded) in the commission of any felony (add one year)

LOCATION

11366  Maintain a place for sale or use (misd. or 16-2-3)
11366.5a  Rents or makes available for manufacture or distribution (misd. or 16-2-3)
11366.5b  Derives benefit or profit to possess for sale, sell, manufacture (3-4-5)
11366.5b  Derive illegal profit to possess for sale, sell, manufacture (3-4-5)
11353.5  Possess for sale, rent, manufacture, etc. upon ground of school or within 1000 ft. of a school (in a public place, or place legally open to minors), while school was in session or when children using the school facility (add 3-4-5)
11376  Transports for sale to non-contiguous county (3-6-9)
11380.5  Possession for sale or use at public park or ocean-front beach if "drug free zone" (includes library, pool, youth center) (add one year)
11380.1a1  if 11380 and offense occurs upon grounds of playground, church, child care, pool, when open or when minors using facility (add one year)
11380.1a2  if 11380 and offense occurs upon grounds of, or within 1000 ft of, school in session or when minors using school facility, (add two years)

MINORS

11380  Utilizing, soliciting, furnishing a minor re: Methamphetamine (3-6-9) (if 11380, then allege PC 1203.07a8 (No probation, NO discretion) if 11380, also allege PC 1203.07a8 (No probation, NO discretion))
11379.7  if guilty of 11379.6 or 11383 in structure where child under age 16 present, add 2 years. If 11379.6 or 11383 and child under 15 suffers great bodily injury, add 5 years. (See Filing Guide page 3)
SCHEDULE II  11555 (b)(6)

CHARGE
11350  Possession (15-2-3)
11351  Possession for Sale (2-3-4)
11352  Sale (transport, import, furnish, administer, give away, or offers..) (3-4-5)
11379.6  Manufacture (process, prepare, etc.) (3-5-7 plus $50,000) (See separate page 7)
11355  Agrees to sell, and then sells another substance in lieu of (misd. or 16-2-3)
11366.8a  Possess or use false compartment in vehicle to store or transport (misd. or 16-2-3)
11366.8b  Design or construct false compartment in vehicle to store or transport (15-2-3)
11401  Analog of cocaine (controlled substance) (i.e. substantially similar chemical structure or effect)

PC 182a1  Conspiracy to do the above (same as substantive charge)
11532  Loitering in a public place with intent to commit a narcotic offense (misd.)

WEIGHT
1233.673b1  Two ounces (1 of substance containing Cocaine) or one ounce of pure Cocaine (No probation; judge has discretion)

11370.4a1  over One kilogram (plus 3 years)
11370.4a2  over Four kilograms (plus 5 years)
11370.4a3  over Ten kilograms (plus 10 years)
11370.4a4  over Twenty kilograms (plus 15 years)
11370.4a5  over Forty kilograms (plus 20 years)
11370.4a6  over Eighty kilograms (plus 25 years)

PRIORS
11370a  Any new 11350, 11351, 11352, 11353, 11355 with any prior narcotics felony offense. (No probation; judge has discretion)
11370.2a  New 11351, 11352, 11380.5 w/prior 11351, 11351.5, 11352, 11378, 11378.5, 11379, 11379.5, 11379.6, 11380, 11380.5 or 11383 add 3 yrs. for each prior conviction.

PC 1203.07  Any new 11351 or 11352 with any prior 11351 or 11352 (No probation; NO discretion)
PC 667.5b  For each prior prison commitment (add one year) (Note: Do not implicate for any prison commitment if upon release date remained free for subsequent 5 years of both further prison and felony conviction

11355c  Prior 11366.5a with new 11366.5a (3-4-3)

FIREARMS
11550e  11550 while in personal possession (incl. passenger compartment of vehicle) of loaded, operable firearm (misd. or 16-2-3)
11370.1  If 11350 while armed (available for offense/defense) with loaded, operable firearm (2-3-4) (No diversion; no deferred entry of judgement)

PC 12022c  11351 or 11352 (or attempt) while armed (available for offense/defense) with firearm (loaded or unloaded, operable or inoperable) (full consecutive 3-4-5) (if vicious, 12022d (add 1-2-3)).

PC 12022a  Armed with firearm (loaded or unloaded) in the commission of any felony (add one year)

LOCATION
11366  Maintain a place for sale or use (misd. or 16-2-3)
11366.5a  Rents or makes available for manufacture or distribution (misd. or 16-2-3)
11366.5  Utilizing fortified location to possess for sale, sell, manufacture (3-4-5)
11366.5b  Derive excessive profit and allow to be fortified (2-3-4)
11352b  Transports for sale to non-continuous county (3-6-3)
11380.5  Possession for sale or sale at public park or ocean-front beach if “drug free zone” includes library, pool, youth center (add one year)

MINORS
11353  Did the deed induce minor to possess, possess for sale, sell, etc. OR hire minor to sell, etc. OR sells, etc. to minor (3-6-9), if 11353, allege PC 1203.07 (No probation; discretion)
11353.1(a)(1)  If 11353 at church, youth center, day care, pool, etc. (add full one year)
11353.1(a)(2)  If 11353 and on or near school (a la 11353.5) (add full two years)
11353.1(a)(3)  If 11353 and minor four years younger than deft. (add full 1-2-3)
11353b  If 11353 (Safe) (No probation; no suspension; NO discretion)
PC 1170.72  If 11353, 11353.5, 11353.7, 11354, 11381, 11380 or 11353.1(a)(3), 11353.8, 11380.1(a)(3), & minor 11 years or younger, then is circumstance in aggravation for sentencing.
SCEDULE I 11054 (f)(1)

CHARGE
11359 Possession (16-2-3)
11351.8 Possession for Sale (3-4-5)
11352 Sale (transport, import, furnish, administer, give away, or offers...) (3-4-5)
11376.8 Manufacture (process, prepare, etc.) (3-5-7 plus $50,000) (See separate page 7)
11358 Agree to sell, and then sells another substance in lieu of (misd. or 16-2-3)
11356.8a Possess or use false compartment in vehicle to store or transport (misd. or 16-2-3)
11356.8b Design or construct false compartment in vehicle to store or transport (10-2-2)
11401 Analog of cocaine base (controlled substance) (i.e. substantially similar chemical structure or effect)
PC 1122a Conspiracy to do the above (same as substantive charge)
11352 Trafficking in a public place with intent to commit a narcotic offense (misd.)

WEIGHT
1203.07b Two ounces of substance containing at least 5 grams of Cocaine Base, or one ounce of pure Cocaine Base. (No Probation; Judge has discretion).
11378.4a1 over One kilogram (plus 3 years)
11378.4a2 over Four kilograms (plus 5 years)
11378.4a3 over Ten kilograms (plus 10 years)
11378.4a4 over Twenty kilograms (plus 15 years)
11378.4a5 over Forty kilograms (plus 20 years)
11378.4a6 over Eighty kilograms (plus 25 years)

PRIORS
1203.07b6 Transporting for Sale, Importing for Sale, Administering, or offering, or attempting (No probation; Judge has discretion)
11376a Any new 11350, 11351.5, 11352, 11353, 11353 with any prior narcotics felony offense with any prior narcotics felony offense (No probation; Judge has discretion)
11376.2 New 11351.5, 11352, 11380.5 with prior 11351.5, 11351.5, 11352, 11376, 11378.5, 11379, 11379.5, 11379.6, 11380, 11380.5 or 11383 add 3 yrs. for each prior conviction
PC 1203.07 (a)(1) Any new 11351 or 11352 with any prior 11351 or 11352 (No probation; NO discretion)
11352.4 New 11353 with prior 11353 (and served prison) (full 1-2-3)
PC 1167.5b For each prior prison commitment (add one year) (Note: Do not impose for any prison commitment if upon release debt remained free for subsequent 5 years of both further prison and felony conviction
11366.5c Prior 11366.5a with new 11366.5a (2-3-4)

FIREARMS
11550e If 11550 while in personal possession (incl. passenger compartment of vehicle) of loaded, operable firearm (misd. or 16-2-3)
11370.1 If 11370 while armed (available for offense/defense) with a loaded, operable firearm (2-3-4) (No diversion; no deferred entry of judgement)
PC 12022e 11351.5 or 11352 if armed (available for offense/defense) with firearm (loaded or unloaded, operable or inoperable) (full consecutive 3-4-5) (if vacated, 12022d (add 1-2-3))
12022a Armed with firearm (loaded or unloaded) in the commission of any felony (add one year)

LOCATION
11353.5 Possess for safe, sell, manufacture upon grounds of school or within 1000 ft. of a school (in a public place, or place legally open to minors), while school was in session or when children using the school facility (add 3-4-5)
11366 Maintain a place for sale or use (misd. or 16-2-3)
11366.5a Rents or makes available for manufacture or distribution (misd. or 16-2-3)
11366.6 Utilizing fortified location to possess for sale, sell, manufacture (3-4-5)
11366.5b Deny excessive profit and allow to be fortified (2-3-4)
11352b Transports for sale to non-contiguous county (3-6-9)
11336.5 Possess for sale or sale at public park or an area near beach if "drug free zone" (includes library, pool, youth center) (add one year)

MINORS
11353 Did the offender fail to possess, possess for sale, sell, etc. OR hire minor to sell, etc. OR sells, etc. to minor (3-6-9) (if 11353, allege PC1203.07b4 (No probation; NO discretion))
11353.1(a)(1) If 11353 at church, youth center, stay care, pool, etc. (add full one year)
11353.1(a)(2) If 11353 and an or near school (2 in 11353.6) (add full two years)
11353.1(a)(3) If 11353 and minor four years younger than deft. (add full 1-2-3)
11376e If 11353 (Sale) (No probation; NO discretion)
PC 1170.72 if 11353, 11335.3, 11335.7, 11354, 11361, 11380 or 11335.1(a)(3), 11335.6, 11380.1(a)(3), & minor 11 years or younger; than is circumstance in aggravation for sentencing
HEROIN

SCHEDULE I 11054 (c)(11)

CHARGE
11350 Possession (16-2-3)
11351 Possession for Sale (2-3-4)
11352 Sale (transport, import, furnish, administer, give away, or offers, etc.) (3-4-5)
11379.6 Manufacture (process, prepare, etc.) (3-5-7 plus $50,000) (See separate page 7)
11165 Agrees to sell, and then sells another substance in lieu of (misd. or 15-2-3)
11366.8a Possess or use false compartment in vehicle to store or transport (misd. or 15-2-3)
11366.8b Design or construct false compartment in vehicle to store or transport (16-2-3)
11401 Analog of heroin (controlled substance) (i.e. substantially similar chemical structure or effect)
PC 182a1 Conspiracy to do the above (same as substantive charge)
B & P 4140 (old B & P 4149) Possession of hypodermic needle or syringe

WEIGHT
11352.5 if 14.25 grams or more of substance containing heroin and 11351 or 11352 (add up to $50,000 fine)
PC 1203.07 (a)(1.2) over 14.25 grams (one half ounce) and 11351 or 11352. (No probation; NO discretion)
11370.4a1 over One kilogram (plus 3 years)
11370.4a2 over Four kilograms (plus 5 years)
11370.4a3 over Ten kilograms (plus 10 years)
11370.4a4 over Twenty kilograms (plus 15 years)
11370.4a5 over Forty kilograms (plus 20 years)
11370.4a6 over Eighty kilograms (plus 25 years)

PRIORS
11370.a New 11350, 11351, 11352, 11353, 11355 with any prior narcotics felony offense. (No probation; judge has discretion)
11370.2a New 11351, 11352, 11380.5 w/ prior 11351, 11351.5, 11352, 11378, 11378.5, 11379, 11379.5, 11379.6, 11380, 11380.5 or 11383 add 3 yrs. for each prior conviction
PC 1203.07 (a)(3) Any new 11351 or 11352 with prior 11351 or 11352 (No probation; NO discretion)
11352.5 Any new 11351 or 11352 with prior 11351 or 11352 (up to $50,000 fine)
PC 667.5b For each prior prison commitment (add one year) (Note: Do not impose for any prison commitment if upon release dept remained free for subsequent 5 years of both further prison and felony conviction)
11366.5c Prior 11366.5a with new 11366.5a (2-3-4)

FIREARMS
11550e 11350 of drug while in personal possession (incl. passenger compartment of vehicle) of loaded, operable firearm (misd. or 16-2-3)
11370.1 11350 while armed (available for offense/defense) with a loaded, operable firearm 2-3-4) (No diversion; no deferred entry of judgement)
PC 1202.2c 11351 or 11352 (or attempt) while personally armed (available for offense/defense) with firearm (loaded or unloaded, operable or inoperable) (full consecutive 3-4-5) (if vicarious, 12022d (add 1-2-3)).
12022a Armed with firearm (loaded or unloaded) in the commission of any felony (add one year)

LOCATION
11364 Maintain a place for sale or use (misd. or 16-2-3)
11365a Rents or makes available for manufacture or distribution (misd. or 16-2-3)
11366.5a Utilizing fortified location to possess for sale, sell, manufacture (3-4-5)
11366.5b Derive excessive profit and allow to be fortified (3-4-5)
11353.8 Possess for sale, sell, manufacture upon grounds of school or within 1000 ft. of a school (in a public place, or place legally open to minors), while school is in session or when children using the school facility (add 3-4-5)
11362b Transports for sale to non-contiguous county (3-4-9)
11380.5 Possession for sale or sale at public park or ocean-front beach if "drug free zone" (includes library, pool, youth center) (add one year)

MINORS
11353 Did the deft induce minor to possess, possess for sale, sell, etc. OR hire minor to sell, etc. OR sells, etc. to minor (3-6-9) (if 11353, allege PC 1203.073b(4) (No probation; discretion))
11353.1(a)(1) If 11353 and minor four years younger than deft. (add full one year)
11353.1(a)(2) If 11353 and minor four years younger than deft. (add full two years)
11353.1(a)(3) If 11353 and minor four years younger than deft. (add full 1-2-3)
PC 1170.72 if 11353, 11353.5, 11353.7, 11354, 11361, 11380 or 11353.1(a)(3), 11353.8, 11380.1(a)(3), & minor 11 years or younger, then is circumstance in aggravation for sentencing
MARIJUANA

SCHEDULE I 11054 (d)(13)

CHARGE

11359 Possession for Sale (16-2-3)
11360 Sale (transport, import, furnish, administer, give away, or offers...) (2-3-4)
     Give away or transport 28.5 grams (one ounce) or less of marijuana (Not hashish) (misd., max. $100 fine)
11358 Cultivate or process marijuana (16-2-3)
11379.5 Manufacture (process, prepare, etc.) (2-5-7 plus $50,000) (See separate page 7)
11355 Agrees to sell, and then sells another substance in lieu of (misd. or 16-2-3)
PC 182a1 Conspiracy to do the above (same as substantive charge)
11366.8a Possess or use false compartment in vehicle to store or transport (misd. or 16-2-3)
11366.8b Design or construct false compartment in vehicle to store or transport (16-2-3)
11401 Analog of controlled substance (i.e. substantially similar chemical structure or effect)
11532 Loitering in a public place with intent to commit a narcotic offense (misd.)

WEIGHT

Except as noted in charges above, NO weight enhancements in the State of California for marijuana.

PRIORIS

PC 667.5b For each prior prison commitment (plus one year) (Note: Do not impose for any prison commitment if upon release did not remain free for subsequent 5 years of both further prison and felony conviction
11366.5c Prior 11366.5a with new 11366.5a (2-3-4)

FIREARMS

12022a Armed with firearm (loaded or unloaded) in the commission of any felony (add one year) (personally or vicariously).

LOCATION

11366 Maintain a place for sale or use (misd. or 16-2-3)
11366.5a Rents or makes available for manufacture or distribution (misd. or 16-2-3)

MINORS

11353.5 Prepare for sale, sell, give away, upon grounds of school, child care, playground, church, during open hours or when minors using facility, if deft is 5 years older than the minor who receives the marijuana (5-7-9)
11351a Utilizing or inducing any minor, or selling or furnishing to a minor under 14 years (3-5-7)
11351b Furnishing to a minor between 14 and 18 (3-4-5)

EXEMPTION

11362.5 11367 and 11358 shall not apply to a patient or to a patients primary caregiver, who possesses or cultivates marijuana for the personal medical purposes of the patient upon the written or oral recommendation of approval of a physician. (See Good to Know, dated January 21, 1997).
I. Policy: The general analytical procedures given here are guidelines that will be followed in casework. Considerable variation in case samples require that analysts have the flexibility to exercise discretion in selecting the method(s) most appropriate for a specific case. The tests performed on the evidence will be dictated by the recommended testing procedures and by the training and experience of the analyst, as appropriate. Very small amounts of substance are required for presumptive and confirmatory analysis. The smallest amount of sample necessary should be used.

A. Guidelines for Suggested Tests

New and Emerging Compounds

The analyst will follow a logical scheme of analysis for presumptive and confirmatory tests based on technical literature, in-house testing or direction from the Supervisor.

1. Colors listed for the presumptive color tests are provided as examples of typical results. The actual color observed depends on a number of factors including the concentration of drug in the sample, presence of other substances in the sample, and the amount of sample used. Different colors may be observed and still contribute to a positive identification.

2. Expedited GC/MS methods may be used when presumptive analysis indicates a drug or drug class is present. For example, the METH method may be used when color tests indicate that methamphetamine is present, or the DEA method may be used when the appearance and markings of a pill indicate diazepam is present.

3. When presumptive tests are inconclusive, the GENERAL method will be used. Poor chromatography on the GENERAL method may require re-shooting a sample on the DEA method.

B. Guidelines for an Identification

D. Confirmatory Tests: A confirmatory test is an analytical test that confirms the identity of a drug in a sample. Examples of confirmatory tests are:

1. Gas Chromatography/Mass Spectrometry
   a. Before comparing an unknown sample to a reference standard the following criteria must be met (rejection of data criteria before comparison with a standard):
      i. The Gas Chromatograph/Mass Spectrometer must be in good working order; passing proper maintenance checks and periodic autotunes.
      ii. Sufficient peak shape (symmetrical) and resolution (baseline) of the unknown peaks
      iii. There should be sufficient mass fragments for comparison and identification without saturating the detector. Sample may be adjusted by dilution or concentration to achieve these results.
   b. For comparison of the unknown sample to a known reference material (standard):
      i. The spectrum must be compared to a verified reference material analyzed on the same instrument using the same method for a confirmation.
         1. The mass spectrum of the sample overall should match the mass spectrum of the reference standard (base ion and other prominent ions).
         2. The overall fragmentation pattern and relative ratios of the ions are compared for consistency.
         3. There should not be any major differences or additional prominent ions that are not explained or noted.
      ii. The vial number of the reference material used will be documented in the case notes
      iii. The relative retention time (RRT) of the sample must be within +/- 5% of the RRT of the reference material for confirmation.
   c. The mass spectrum should contain at least 10 prominent ions (when possible) as well as the molecular ion (if present in standard).
      1. The relative intensity of the major ions should agree between the reference and the sample spectrum.

C. Presumptive Tests: A presumptive test is an analytical test that eliminates some drugs from consideration; and at the same time indicates which class of drugs might be present. Examples of presumptive tests are:

1. Color Tests
2. UV Fluorescence
3. Physical Appearance and Markings - for Pharmaceutical Preparations

Table from: "SWGDRUG Methods of Analysis/Drug Identification Recommendations"

1. When a validated Category A technique is incorporated into an analytical scheme, at least one other technique (from either Category A, B or C) shall be used. When a Category A technique is not used, at least three different validated techniques shall be employed. Two of the three techniques shall be based on uncorrelated techniques from Category B. In cases where hyphenated techniques are used (e.g. gas chromatography-mass spectrometry), they will be considered as separate techniques provided that the results from each are used.

2. For cannabis, macroscopic and microscopic examinations will be considered as uncorrelated techniques from Category B when observations include documented details of botanical features. For exhibits of cannabis that lack sufficient observable macroscopic and microscopic botanical detail (e.g. extracts or residues), Δ9-tetrahydrocannabinol (THC) or other cannabinoids shall be identified.
   a. Only botanists may identify cannabis and other botanical material utilizing morphological characteristics (category B) alone provided sufficient botanical features appropriate for identification are observed.
   b. Microscopic examination includes observations of botanical features with the aid of a microscope. Suggested language for documentation include:
      i. **Plant material with clustered green leaves**, with the option of adding additional information: colors, presence of stalks, stems or seeds if significant. Clustered is the assumed clustering around a stem or stalk consistent with a "bud-like" structure
      ii. **Plant material with loose green leaves**, with the option of adding additional information: colors, presence of stalks, stems or seeds if significant. This is the macroscopic description for loose leaves that do not appear to be attached to a stem or stalk.
      iii. **Plant material with green leaves and stem**, with the option of adding young or attached leaves. This is the macroscopic description for "leaf clippings" or representative samples of plants when the leaves are often young.
      iv. **Whole plant material with green leaves, stem and roots**, if all are present. This would be the macroscopic description for a whole plant.
   b. FTIR spectra

4. For cannabis and botanical materials only: recording of detailed descriptions of morphological characteristics.
   a. Macroscopic examination includes observations of botanical features without the aid of a microscope. Suggested language for documentation include:
      i. **Plant material with clustered green leaves**, with the option of adding additional information: colors, presence of stalks, stems or seeds if significant. Clustered is the assumed clustering around a stem or stalk consistent with a "bud-like" structure
      ii. **Plant material with loose green leaves**, with the option of adding additional information: colors, presence of stalks, stems or seeds if significant. This is the macroscopic description for loose leaves that do not appear to be attached to a stem or stalk.
      iii. **Plant material with green leaves and stem**, with the option of adding young or attached leaves. This is the macroscopic description for "leaf clippings" or representative samples of plants when the leaves are often young.
      iv. **Whole plant material with green leaves, stem and roots**, if all are present. This would be the macroscopic description for a whole plant.
   b. FTIR spectra
2. Prominent ions with a relative intensity greater than 10% of the base ion in the reference spectrum should be present depending upon concentration) in the sample spectrum.

v. For confirmation, the reference material must be run within the calendar month of the sample.

c. GCMS Settings:
   i. To ensure the highest quality analysis of each compound of interest is achieved, each Gas Chromatograph/Mass Selective Detector has settings which can be changed at the discretion of the Criminalist. Some settings are considered alterable while others are more crucial to the integrity of the method being used.
   ii. If settings are altered from the validated method parameters it must be documented; this may be accomplished by documenting the alteration to the method parameters in the analyst's notes.
   iii. The following are examples of settings that may be altered at the discretion of the Criminalist:
      1. The EM Voltage or Gain Factor
      2. The Injection Size
         1. Injection volumes greater than 1 µL may overflow vapor from the inlet, causing analysis variations. If the injection volume is adjusted, it is important to consider the inlet size, inlet temperature and solvent volume before the injection. See Chemstation software calculator to assist with injection volume adjustments.
      3. The Split Ratio & Flow for the inlet
      4. The Final Hold Time
   iv. The following are examples of settings that may not be altered for casework analysis:
      1. The temperature program
      2. The column flow

d. See DRG.19 for required checks to ensure reliability of test results.

e. See DRG.25 for instructions on the use of Macros.

f. See DRG.38 for instructions on the proper entry of results into LIMS.

2. Infrared Spectrophotometry

a. Before comparing an unknown to a reference standard the following criteria must be met (rejection of data criteria before comparison to a standard):
   i. The Infrared Spectrometer must be in good working order; passing proper maintenance checks and contamination ready checks
   ii. Both Contamination and Background checks must pass
   iii. Identifiable peaks present in the fingerprint region (2000-500 cm⁻¹) that may be compared to a standard

b. For comparing an unknown sample to a reference standard:
   i. For a confirmation, the unknown spectrum must be compared to verified reference material, analyzed on the instrument, using the same technique (e.g. UATR).
   ii. To determine a match, the sample and standard must be analyzed carefully by a qualified analyst.
   iii. The overall absorbance pattern and relative ratios of the peaks within the spectrum are compared for consistency.
   iv. A peak comparison is made between the unknown sample and the reference standard in the fingerprint region of the IR spectrum (2000-500 cm⁻¹).
   v. Peaks present in the standard spectra should be present in the unknown sample spectra.
   vi. There should be no significant additional bands in the unknown sample when compared with a reference standard.

c. For confirmation, the reference material must be run within the calendar month of the sample.

d. The vial number of the reference material used will be documented in the case notes

e. See DRG.30 for required checks to ensure reliability of test results.

f. See DRG.38 for instructions on the proper entry of results into LIMS.

3. Stereomicroscopy-For Cannabis ONLY

E. Guidelines for No Common Controlled Substance Detected

1. It is up to each trained analyst to decide which tests are performed on a case by case basis. There can be variability in color reactions based on the composition of the materials being tested and pH may also be taken into account. To report that a sample has no common controlled substance detected the following criteria should be met:
   a. Solid Sample
      i. The following color tests performed: Marquis, Mecke, Froehde, Modified Cobalt Thiocyanate, Liebermann, and pDMBA.
      ii. A methanol extraction analyzed by Gas Chromatography/Mass Spectrometry using the GEN method that does not show the presence of any commonly controlled substance. An acid/base chloroform extraction analyzed by Gas Chromatography/Mass Spectrometry using the GEN method may be performed instead of a methanol extract.
      iii. Approximately 25-35 mg of sample should be used and diluted in 5-8 drops of solvent to ensure adequate extraction of potential substances in the unknown.
iv. Any number of units counted and reported will be a descriptor of the evidence analyzed. No uncertainty will be assigned to the number counted. See [DRG.38](#) for instructions on entering results in LIMS.

b. **Liquid Sample**
   i. The following color tests performed: Marquis, Mecke, Froehde, Modified Cobalt Thiocyanate, Liebermann, and pDMBA.
   ii. Any volume measurement reported will be a descriptor of the evidence analyzed. No uncertainty will be assigned. See [DRG.38](#) for instructions on entering results in LIMS.
   iii. An acid and basic chloroform extraction analyzed by Gas Chromatography/Mass Spectrometry using the GEN method that does not show the presence of any commonly controlled substance. For an unknown clear liquid where color tests are inconclusive, it is recommended to check the pH of the liquid. Instructions for extraction:
      1. Take a few drops of sample-add to a shell vial
      2. Add 1 drop of 10% HCI-check pH
      3. Add 5-10 drops of chloroform-check pH (should be acidic)
      4. Aspirate the chloroform (bottom layer) into a GC/MS insert-fill insert to about ½ full
      5. Add 1-2 drops of saturated sodium carbonate (Rothera 2) to original sample (shell vial)-check pH (should be basic)
      6. Add 5-10 drops of chloroform
      7. Aspirate the chloroform (bottom layer) into the same GC/MS insert (with the acidic solution)
      8. Check the pH of the insert (should be neutral)
      9. Add internal standard (n-tricosane)
     10. Use chloroform blanks
     11. GEN method (I.S. is typically n-Tricosane for most analytes and cholesterol for steroids)

c. **Plant Material**
   i. The following color test is negative: Duquenois-Levine.
   ii. Stereo microscopy is not consistent with Marijuana
   iii. A methanol extraction analyzed by Gas Chromatography/Mass Spectrometry using the GEN method that does not show the presence of any commonly controlled substance.
   iv. Note: If only #i and #ii are done, then the analyst can only conclude the sample was negative for Marijuana.

d. **Mushroom-like Material**
   i. The following colors tests are negative: Webers and pDMBA.
   ii. A methanol extraction analyzed by Gas Chromatography/Mass Spectrometry using the GEN method that does not show the presence of any commonly controlled substance.

e. **Miscellaneous (Food, Swabs, Paper, Clothes, etc.)**
   i. Visually inspect the sample for obvious stains or irregularities (eg. paper may have water marks from soaking)
   ii. Cut or remove a portion of the item
   iii. Extract in appropriate solvent
   iv. You may need to concentrate and clean-up the sample using the drying block and centrifuge
   v. A methanol (solid sample) or acid/base chloroform (liquid sample) extraction analyzed by Gas Chromatography/Mass Spectrometry using the GEN method that does not show the presence of any commonly controlled substance.

F. **Guidelines for Licit Pharmaceutical Pills**

1. Non-controlled pills may be presumptively identified by appearance and markings. If markings are visible on a whole pill, then it can be presumptively identified as consistent with the appearance and markings of a reference with the exception of licit pharmaceuticals known to have counterfeits (eg. Steroids) or illicit pills (eg. suspected MDMA).
   a. The pill should be drawn, described or an electronic image may be printed out (including its shape, color, and markings). In the case notes, a drawing of the pill(s) or electronic image, the name of the reference used, the page number(s), the brand name (or common name), the schedule/prescription/over the counter status, as well as the usage should be indicated.
   b. The report will clearly indicate the results are presumptive. For example: "The appearance and markings are consistent with the reference."

2. Controlled pills should be confirmed. It is at the discretion of the analyst to determine how many items to confirm as it depends on the schedule and number of pills for each item.
   a. If a controlled substance that is not a pill has been confirmed for a suspect, the analyst may presumptively identify licit pharmaceuticals by appearance and markings.
   b. Any pill count reported will be a descriptor of the evidence analyzed. No uncertainty will be assigned. See [DRG.38](#) for instructions on entering results in LIMS

3. If the pill cannot be identified, or the markings are not legible then the pill must be treated like an unknown solid; the appropriate color tests and analysis by Gas Chromatography/Mass Spectrometry must be performed.

4. References are maintained for comparison and presumptive identification purposes. The following are approved references for use:
a. Poison Control Center 1-800-876-4766 or website: https://pill-id.webpoisoncontrol.org/
c. Physicians' Desk Reference (PDR) (any version)
d. Drug Identification Bible (any version)
e. Pill Identification Reference Rx-ID CD-ROM's (any version)
g. Drugs.com Pill Identifier: https://www.drugs.com/imprints.php
h. The manufacturer's website or phone conversations with the manufacturer
i. Other references may be used if approved by the Supervisor or Manager. This approval will be documented by the Technical Review of the case.

5. If one of the above references is used for presumptive identification, the report shall list the analytical technique as "Reference"

G. Guidelines for Extracted Materials

1. If any part of an item that has been analyzed and/or extracted is to be returned to the Controlled Substance envelope; it must be repackaged separately from the unexamined portion of that item. It should be marked as an extracted portion of the item (eg. mushrooms, LSD blotter paper, etc.).
2. A notation in the case-notes should indicate extracted material was returned to the Controlled Substance envelope. This is to avoid altering the evidence.

H. Guidelines for Library Matches-GC/MS

1. The mass spectral libraries are maintained for comparison for presumptive identification purposes.
2. Analysis of "unknown" spectra run on full scan is performed by the instrument's software of a semi-automated search against a commercial or user-created library. The results may yield a "match" or "hit" with a certain ratio or percentage associated.
3. Final review of a library match must be performed by an analyst and the following should be considered:
   a. For a match to be considered positive, typically the most abundant ions in the unknown spectrum must match those in the "known" standard, and should be in the same relative abundance ratios.
      i. Top 10 most abundant ions in unknown must match those in the known. The ions must be present in similar relative abundances.
      ii. If the 10 most abundance ions don’t match:
         1. Evaluate ion flip. When two ions have a slight shift in relative abundance between the unknown and known. Ions may "flip" based region being scanned in the peak. Try scanning a different region in the unknown.
         2. Evaluate relative ion abundance. When the same ion appears in the unknown and known, but they appear to have different relative abundances, this can be a result of concentration differences. In most cases, the differences in ion abundances should be relatively minor.
         3. Evaluate the presence or absence of ions from the unknown to the known. Additional ions in the unknown may be explained by column bleed (207, 281, 355). Very low abundance ions may be missing due to differences in concentration. The 10 most abundant ions should still be present in similar relative abundances.
         4. Evaluate the presence or absence of ion clusters or groups. The ion present in groupings or clusters should not differ, although their relative abundance may differ slightly.
   5. Search Tips:
      1. Search multiple libraries and evaluate the top candidates in each library.
      2. For spectra with multiple ions in very low abundance, consider a baseline subtract to reduce the impact of septa or column bleed.
   6. If after performing the steps above and the spectral match is not justifiable (meeting proper criteria), then it will not be identified as a presumptive library match.
   b. Occasionally, ions in the reference spectrum may be missing from the "unknown" due to low overall abundance.
   c. If additional ions are present in the unknown, it is suggested to try to determine if these "extra" ions may be due to a co-eluting substance, or "background" such as column bleed or diffusion pump oil. An ion subtraction may aid in this.
   d. Library matches should be reported as a screen or presumptive positive only if no confirmation has been performed or if the unknown has not been compared to a reference material run on the same instrument and the same temperature program.
4. The presumptive positive test will be included in the case notes. The TIC will be labeled with the presumptive library ID and supporting data printout will be included for the library match. The mass spectral library used will be documented on the data printout.
5. Additions to the mass spectral libraries may be made only after approval by a Supervisor/Manager. This control will be documented by the analyst entering the new addition. The analyst will indicate who is making the addition and the person authorizing the addition.

I. Guidelines for Library Matches-FTIR

1. The FTIR spectral libraries are maintained for comparison for presumptive identification purposes.
2. Analysis of unknown sample spectra are collected on the instrument. The FTIR software allows for a search against a commercial or user-created library. The results may yield a "match" or "hit" with a certain ratio or percentage associated.
3. Final review of a FTIR library match must be performed by an analyst and the following should be considered:
a. For a match to be considered positive, the unknown sample spectrum must be consistent with the spectrum of the library reference.
b. A peak comparison is made between the library reference and the unknown sample spectra in the fingerprint region of the spectrum (2000-500 cm⁻¹)
c. Library matches should be reported as a screen or presumptive positive only if no confirmation has been performed with a reference standard.

4. The presumptive positive test will be included in the case notes. The FTIR spectra will be labeled with the presumptive library ID. The IR library will be identified and documented on the data printout.

5. Additions to the FTIR spectral libraries may be made only after approval by a Supervisor/Manager. This control will be documented by the analyst entering the new addition. The analyst will indicate who is making the addition and the person authorizing the addition.

END OF DOCUMENT
I. Policy: The following procedure will be followed for entering results into LIMS for generating the notes and report.

A. Item description and itemization

1. In the Request Tab of the case:
   a. Right-click on the request.
   b. Select "Edit Findings"

2. Create new items or use existing ones:
   a. For requests on new submissions that do not have sub-items: create items as outlined in steps C through E. Items should only be created one level below the submission.
   b. For existing evidence that has been previously analyzed and sub-itemized in the drug section: use the existing items. Make sure that the items that are to be analyzed are related to the new request (this should already have been done by the clerks). Skip to step F.
   c. For existing evidence that has been analyzed in Latent Prints (or other Criminalistics sections) where they have already created sub-items:
      i. create new ones as outlined in C though E. Items for Drug Section should only be created one level below the submission. The clerks should already have unrelated the existing Criminalistics items.
      ii. If the items created by another unit are only one level below the submission and the item description meets the drug section requirements, the existing items may be used. Relate the items to the drug request.

   NOTE: Drug section analyzes the contents (suspected controlled substance) of each item. Other sections are analyzing fingerprints, marks, DNA, etc. most likely from the packaging. Entering two items (one for the packaging and one for the contents) allows for separate descriptions and itemization schemes that may better meet each section's requirements. The "Other ID" field is used to designate the officer's assigned item number which will link the two pieces of evidence together. See QA.09.

3. In the Edit Findings screen (Controlled Substances Analytical Module):
   a. Right-click on the submission.
   b. Select "Itemize"
4. In the Description field enter:
   a. The item description (including number, type of packaging, and location).

5. In Other ID enter:
   a. The agency item number (if indicated).
   b. NOTE: The number in the "Evidence Barcode" field should be zero, or a page of barcode script will print on the default printer.

B. Results and Notes
   1. In the Edit Findings screen (Controlled Substances Analytical Module):
      a. Right-click on the newly created item.
      b. Select "Add result"
2. In the "Analysis Notes" field enter:
   
a. The bench notes related to the analysis of the item will appear only in the notes printout, and include:
   
i. detailed packaging (all packaging for each item),
   
ii. description of item (including color, texture, appearance),
   
iii. notes on weight (indicate net, estimated, gross and weight calculations),
   
iv. tests done (presumptive and confirmatory tests and the results of each test),
   
v. note comments (any comments about repackaging, not examined, etc.),
   
vi. discrepancies (any discrepancy should be initialed by another analyst). Also check the "Inventory Discrepancy" checkbox in the request extended data form.
   
vii. and the final result (indicate what analyte(s) are present).

3. The analyst is responsible for selecting the correct substance and schedule.
   
a. Consult the California Health & Safety Code, Drug Monographs, CopWare, DEA website, or other resources for determining if a substance is scheduled in California or is Federally scheduled.

4. In the Result field enter:
   
a. The final result analyte. **Use the pull-down menu to select the correct analyte, if present in the pick-list.**
   
b. If additional analytes are found present in an item, they should each be added as a different result from the pull-down menu pick-list.
   
i. NOTE: The final report may sort additional analytes first by schedule (lowest to highest i.e., I to V) and then sort the names alphabetically.
   
ii. Analytical notes and report notes are tied to the final result analyte entry. If the order of report comments or analysis notes sorts strangely on the notes or final report, try moving them to a different analyte.
   
c. If an analyte is not in the menu selection a generic result must be chosen and the result must be manually entered the Result Notes field
   
i. If the analyte is controlled and confirmed, select "Other Controlled Substance" and manually enter the drug name
   
ii. If the analyte is controlled and not confirmed, select "See comment" and manually enter the drug with additional notes
   
iii. If the analyte is not controlled, select "Not controlled" and manually enter the drug with additional notes

5. In the "+/-.\" field enter:
   
a. The schedule override (as a number) if needed.
   
b. Select schedule "57" as the schedule for synthetic cannabinoids
   
c. Select schedule "75" for synthetic cathinones
d. Select schedule "90" when the drug is not controlled under California CSA but it is controlled federally.

6. In the "Result Notes" field enter:
   a. Any comments if needed. These notes or comments will appear on the report. Examples are:
      i. Appearance and markings are consistent with a reference
      ii. One pill was analyzed and contained the above result
      iii. Presumptive tests only
      iv. The substance is non-controlled in California but is Federally scheduled
      v. Items not labeled on internal packaging; unable to assign officer's item numbers

7. If multiple items are present:
   a. Click the ellipsis ("…") button in the lower right corner
   b. In the # Tested field enter:
      i. The number of packages that were analyzed. This defaults to 1.
   c. In the # Total field enter:
      i. The total number of packages present. This defaults to 1.
C. Weights or Other Quantity

1. To add weights or other quantity information to an item:
   a. In the Edit Findings screen (Controlled Substances Analytical Module):
   b. Right-click on the item and select Add Result.

2. In the Result field enter:
   a. "Quantity"

3. In the first Weight field pick-list enter:
   a. The type of quantity involved (net weight, total estimated weight, etc.)

4. In the second Weight field enter:
   a. The numeric quantity as a number.
      i. NOTE: fractional quantities should be given as a decimal (ie "1.25" NOT "1-1/4"-crystal cannot read fractions)
      ii. If a measurement is below 0.020 grams, leave this field blank
   b. All digits should be used.
   c. If the balance is connected to the computer, either the "Cal/Menu" print button on the balance, or the F12 key on the computer keyboard can be used to send the numeric weight result to the cursor position on screen. The balance settings must be properly configured and the software running in order to send over the weight.

5. In the third Weight field pick-list enter:
   a. The units (grams, milliliters, pills, etc)
   b. If a measurement is below 0.020 grams, select "residue" for this field. Residue is defined in DRG.41.

6. In the last pick-list on the Weight row enter:
   a. The Balance or other traceable instrument used to derive the quantity.
      i. the balance may be entered if reporting residue
   b. NOTE: every "Net Weight" needs to have a balance.
c. NOTE: There should be a separate weight result for each item tested. This is in addition to any final
analyte results with notes. There should be an additional result for total weight or other total
quantity if needed.

D. Traceability

1. Traceability is kept in two different ways—once for the overall request to track lot numbers, and once on
each tested item to display the methods used in analysis.

2. Once per request on the first submission, add a new result.
   a. Enter the analyte as "Traceability".
   b. In the area marked "Examinations", click on the "+" button:
      i. Select a test performed.
      ii. ALL analytical techniques used for analysis should be listed here once.
         1. Exact color test name
2. Exact instrumental analysis name

3. "Reference" - to indicate a pharmaceutical reference was used

iii. In the large "Notes" field, enter in the traceability information for the examination:

1. For color tests, enter in the Lot number of the solution. If multiple Lot numbers were used, separate each with a comma or a new line entry.

2. Entering the Lot number in analyst's notes section is also sufficient for traceability

3. For GC/MS or FTIR or other instruments that compare the unknown with a standard, the Lot number of the standard can be entered

4. The Lot number of the standard on the instrumental print out is also sufficient for traceability

5. For Reference, enter the pharmaceutical reference used such as pill- id.webpoisoncontrol.org or Amera-Chem

6. Entering the exact reference in the analyst's notes section is also sufficient for traceability

iv. All techniques chosen will appear on the notes with the added lot numbers/traceability information.

3. Once per each analyzed item, add a new result

a. Enter the analyte as "Traceability".

b. In the "Analysis Notes" field, add the names of the color tests, instruments, and other methods used to analyze the item. These names should match the ones selected above for the overall request traceability.

c. An analyst can use auto-text to help automate and standardize the entries.

d. All techniques listed will appear on the report and notes for each item.

E. Analysis Date Range

1. To enter the dates of analysis (dates will appear on the report)

a. In the Request Tab of the case:

   i. Right-click on the request

   ii. Select "Additional Data"

   iii. Enter the "Analysis Date Begin" and "Analysis Date End"

1. If analysis was started and completed on the same day, then only the "Analysis Date Begin" is required

2. Even though the time is displayed, it is not used.
F. Reports for No Work Done

1. To generate a report where no work is done:
   a. In the Request Tab of the case:
      i. Right-click on the request.
      ii. Select "Additional Data"
      iii. Check the "No Work" check box.

2. Edit findings and itemize evidence as in step A above:
   a. Each submission will need one item in order to get the chain of custody to print properly on the report.
   b. Since the items are not examined list the description as "Not opened, not examined."

3. Add "Traceability" Result and choose "None" from the Available Examinations.

4. In the Request Tab of the case:
   a. Right-click on the request.
   b. Select "Edit Lab Notes"
   c. In the large blank, add a narrative related to this request that will appear on the final report.
      i. The narrative could include: who requested the change, give the name and title if known, the reason why no work was required, and the disposition of the evidence.
I.  **Policy:** The Controlled Substance Unit will not subcontract with another laboratory, for analysis that the unit does not have the technical capability to perform.

A.  The laboratory may provide the requesting party with a list of laboratories that may be capable of performing the requested work.

B.  The laboratory will not make any recommendations nor advise the client on selection of the outside laboratory.

II.  **Policy:** Referee Analysis is analysis performed by an outside laboratory per a request from the subject* or the defense counsel. *If the subject is representing him or herself, then he/she may make the request. See **FSD.31** for more information.

A.  The Crime Laboratory will prepare the sample for transportation to the desired laboratory (referee laboratory) for a fee that must be paid by the subject or his/her attorney.

   1.  The cost of any analysis performed by the referee laboratory must be paid by the subject or his/her attorney.

B.  **Conditions Required:**

   1.  The following conditions should be met before Forensic Service Division staff sends any solid dosage drug evidence to an outside laboratory for referee analysis:

   2.  A written documentation is sent to the Forensic Services Division by the subject's attorney requesting evidence be sent to another laboratory for referee analysis. This letter should include:

   a.  The Forensic Services Division laboratory number and/or agency and agency case number and subject name.

   b.  The mailing information of the referee laboratory that the evidence will be sent to.

   c.  A sample preparation and handling fee if required, paid to the Forensic Services Division (refer to the most current fee schedule) by the subject or his/her attorney before the evidence is sent.
d. For the Public Defender's Office in Contra Costa County, our laboratory can bill a County Org Number, therefore a check is not required. However, a written authorization to bill the Public Defender's Office should be obtained, along with the correct County Org Number to be charged if needed.

3. **For Solid Dosage Drug evidence, an authorization from the District Attorney's Office or a Court Order is required before any evidence can be sent for referee analysis.**
   a. It is the responsibility of the subject or his/her attorney to acquire such authorization. A letter of authorization (or some written documentation) from the District Attorney or a copy of the Court Order should accompany any written request for referee analysis. The letter of authorization should specify which item(s) the District Attorney is authorizing to be sent for referee analysis.

C. **Preparing The Evidence:**

1. The following is the recommended procedure for preparing evidence to be forwarded for referee analysis:

2. It is the responsibility of the requesting party (subject's attorney) to arrange for the evidence to be sent to the Contra Costa County Crime Lab (if the evidence is outside the Crime Lab). The evidence must be received by the Crime Lab in a sealed condition.

3. After the appropriate documentation is received by the Forensic Services Division:
   a. The evidence should be transferred to the laboratory staff member performing the evidence split.
   b. The accompanying paperwork should be given to the laboratory staff member. If feasible, the person who originally examined the evidence should re-open the Controlled Substance Submission and split a portion of the appropriate item(s).
   c. On the original Controlled Substance Envelope the chain of custody should reflect that the laboratory staff member received the Controlled Substance Envelope, split the item(s) inside the Controlled Substance Envelope to be sent to another laboratory and returned the original Controlled Substance Envelope back to its storage location (agency, evidence room, Property, etc.) as indicated below:

<table>
<thead>
<tr>
<th>Evidence Received From</th>
<th>Evidence Delivered To</th>
<th>Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Evidence</td>
<td>Lab Staff Member</td>
<td>5/31/06</td>
</tr>
<tr>
<td>Split Item X (agency #) Initials and date</td>
<td>Bay Area Forensics via Golden State Overnight</td>
<td>5/31/06</td>
</tr>
<tr>
<td>Lab Staff Member</td>
<td>Evidence</td>
<td>5/31/06</td>
</tr>
</tbody>
</table>
d. The evidence is then opened and a portion of the item(s) to be split is weighed. The split evidence should be packaged (typically into a zip-lock plastic bag), sealed, and marked (with the laboratory number, item/sub-item number, initials and date). The original item should be re-sealed (with initials and date).

e. Typically the laboratory sends a reasonable amount of the available sample. Laboratory staff can split 50-200 milligrams (or 1-3 milliliters for liquid samples) depending on the amount of sample we have to begin with. The amount of substance sent should be documented in LIMS. See DRG.38.

f. If the sample size is small, such that the entire sample must be sent, it has to be authorized by the District Attorney's office.

4. The split item(s) are placed into a Controlled Substance Envelope marked "DUPLICATE" and sealed with Evidence Tape.

a. All the agency provided case related information on the original Controlled Substance Envelope should be copied onto the "DUPLICATE" envelope. The original Laboratory number should be written at the top of the "DUPLICATE" Controlled Substance Envelope. The chain of custody should not be duplicated. The first line of the chain of custody on the "DUPLICATE" Controlled Substance Envelope should reflect the item(s) have been split and are being sent to a referee laboratory (as indicated below):

<table>
<thead>
<tr>
<th>Evidence Received Form</th>
<th>Evidence Delivered To</th>
<th>Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Split Item X (agency #)</td>
<td>Bay Area Forensics</td>
<td>5/31/06</td>
</tr>
<tr>
<td>Initials and date</td>
<td>via Golden State Overnight</td>
<td></td>
</tr>
</tbody>
</table>

5. A copy of the attorney's written request for referee analysis should be stapled to the "DUPLICATE" Controlled Substance Envelope. It is recommended to include some notation to the referee laboratory that the cost of any analysis requested by the subject's attorney MUST be billed to the attorney and NOT to the Contra Costa County Crime Lab. The report of analysis and/or any questions regarding analysis should be directed to the attorney requesting the analysis.

6. Fill out an OLA Request Form. This form can be obtained from another unit that routinely performs OLA analysis (ALC.38).

7. If necessary, fill out a Billing Sheet; this form is forwarded to Sheriff's Office Accounting for proper billing of the requesting party.

8. Please refer to the Division Manual for required documentation for tracking when releasing evidence for referee analysis or outside laboratory analysis (OLA).

D. LIMS Procedure

1. OPEN the laboratory number.

2. Under the EVIDENCE tab, right click on the description of the item that is to be split (eg. 001-02)

3. This will open the EVIDENCE MENU for that item, select ITEMIZE EVIDENCE
4. In the DESCRIPTION field, indicate: "Split 100 mg of Item X, forwarded to Bay Area Forensics via Golden State Overnight (Attorney's name) request, Initials and date"

5. In the NOTES field indicate: Referee Analysis

6. Click APPLY to create the new split item*
   a. * For laboratory cases that were generated before the LIMS upgrade to electronic reports, the sub-itemization (or split/derivative evidence) will be the "second level" (001-01). For laboratory cases after the LIMS upgrade, the item to be split has already been itemized in the "second level" (001-01) and the sub-itemization (or split/derivative evidence) will be in the "third level" (001-01-A).

7. Under the CASE INFO tab, and in the SYNOPSIS field indicate: "Split 100 mg of Item X, forwarded to Bay Area Forensics via Golden State Overnight (Attorney's name) request, Initials and date"

8. Under the EVIDENCE tab, select the new split item (eg. 001-02-A), and click the BAR CODE ICON in the lower right corner, and select REGISTER.

9. Scan the DUPLICATE barcode (these small barcodes can be found in the alcohol or toxicology section).

10. After the DUPLICATE barcode has been registered and associated with that split item, attach the DUPLICATE barcode to the "DUPLICATE" Controlled Substance Envelope.

11. TRANSFER the "DUPLICATE" Controlled Substance Envelope in LIMS, to the referee laboratory it is being sent to:
   a. via "Split Chain of Custody"
   b. notes "Via Golden State Overnight"

12. TRANSFER the original Controlled Substance Envelope back to a storage location.

E. How To Send The Evidence/Split

1. The following is the recommended procedure for forwarding a split item for referee analysis (after it has been properly packaged and sub-itemized in LIMS):

2. The "DUPLICATE" Controlled Substance Envelope should be placed into a manila mailing envelope (these can be located in the alcohol section because they commonly send samples to referee labs).

3. The mailing envelope should be labeled appropriately with the address of the referee laboratory along with the Crime Laboratory's return address. It is recommended that the mailing envelope be sealed with Evidence Tape.

4. The mailing envelope should be sent via Golden State Overnight.

5. All written documentation from the subject's attorney and/or District Attorney regarding the request for referee analysis should be filed with the laboratory report. Along with the electronic notes (in the DESCRIPTION field of the EVIDENCE tab, and the SYNOPSIS field under the CASE INFO tab)
6. A notes-to-file page may be hand written and attached to the laboratory report, or the electronic notes may be printed and attached to the laboratory report as notes-to-file. The notes-to-file should include:

   a. The date of the split
   b. The weight of item(s) that was split
   c. The name of the attorney requesting the referee analysis
   d. The referee laboratory where the split item(s) were sent and the method of shipment (courier, Golden State Overnight, Fed Ex, etc.)

III. The Controlled Substances Unit Staff shall comply with all reasonable and legitimate Discovery Requests.

   A. All discovery requests are routed to the Forensic Services Division via the District Attorney's Office. These requests typically pertain to documents related to the analysis of samples or records kept in the normal course of Laboratory business. See FSD.45 for more information on discoveries.

   B. The Controlled Substances Unit provides "basic discovery" or "extensive discovery" records.

   C. A "basic discovery" is a pre-set package that consists of:

      1. Copy of laboratory report and notes
      2. Chain of Custody

   D. An extensive discovery is not a pre-set package. It may be a request for more detailed documentation to include, but not limited to the Examination Records, Instrument Records, Equipment used and their Calibration Records, Standard Operating Procedures, Proficiency Records, etc.

      1. If the discovery information sought appears to be unreasonable or irrelevant, a Supervisor or designee may contact the District Attorney's office for assistance in obtaining a modification or quashing the discovery. The District Attorney's office should review the discoveries for relevance, before sending the request to the laboratory.

   E. Discovery Procedures

      1. The Clerical staff will create a discovery request in LIMS and image the request, report with notes, and chain of custody (CLER.DAT.12)

      2. The analyst within the unit will review the discovery request and determine if further information is needed.

      3. The discovery requests may be completed electronically and posted via ARIES.

         a. The electronic files of the records requested will be gathered and uploaded into LIMS. If concatenation is desired, detailed procedures on how to concatenate .pdf documents can be found in "Electronic Batch Documents" (TOX.10).

         b. In the LIMS imaging module, right-click each image to be released as part of the discovery, and select "Send to iResults". A check mark will appear next to the "Send to iResults" menu.
c. The discovery request will be marked as "Draft Complete" by the analyst completing the discovery.

d. The completed discovery will be checked and marked "Admin Reviewed" by a Supervisor or designee.

e. The electronic discovery records will be accessible via ARIES for the District Attorney's office to retrieve. There is a 24 hour lag from the time the case has been Admin Reviewed before the records will be accessible to the DA's office.

4. Any records not able to be uploaded into LIMS will be provided outside of ARIES. Form **FSDF.19** (Discovery and Crime Scene Materials Receipt Form) can be used to document the release of records.

5. Any "RUSH" discoveries may need to be provided as paper or faxed copy. The "RUSH" discoveries need to be approved by the Supervisor to assess the exigency of the circumstances (**FSD.45**).

F. See **FSD.45** and **CLER.DAT.07** for handing Civil Discoveries and Subpoena Duces Tecum.

END OF DOCUMENT
I. Policy:  The following procedure will be followed for reanalysis of cases scheduled for destruction.

A. The reanalysis of cases scheduled for destruction is an additional check of the laboratory's procedures to ensure the quality and validity of test results. (ISO/IEC 17025:2005 5.9.1)

B. Periodically, the Sheriff's Office Property will schedule a destruction of drug evidence.
   1. Sheriff's Office Property will send a list of laboratory numbers related to Controlled Substance analysis.
   2. The Supervisor or Manager will review the list and randomly pick a number of cases for reanalysis, and let Property know which cases will be retested.
   3. Sheriff's Office Property will send those cases to the Laboratory.

C. The cases for destruction will be given new request number under the original Laboratory number.
   1. The cases for destruction will be logged in under the service type "Reanalysis for Destruction"
   2. This service type prevents the results from being automatically released onto the Automated Regional Information Exchange System (ARIES) and prevents them from getting billed to the requesting agency.
   3. The clerical staff will relate the items to the new request.
   4. The Supervisor or Manager will let the clerical staff know which analyst will be performing the reanalysis.
   5. The clerical staff will assign the cases to the analyst selected and also provide the analyst with a copy of the original report.

D. The analyst will follow the Division procedures for transferring evidence.

E. The analyst will open the evidence and reweigh and reanalyze by presumptive testing ONLY the items previously examined.
   1. The analyst will record the date, weight and results of the presumptive testing for each item previously examined.
   2. If any item does NOT presumptively test positive for the controlled substance originally identified, the analyst will take that item to confirmation.
F. The analyst will turn in the report to the Supervisor or Manager. The Supervisor or Manager will review the results of the reanalysis to ensure the validity of the test results. They will also review the weights to ensure consistency between the original weight and the reexamined weight.

1. As there can be considerable gain or loss in the weights of some controlled substances depending on packaging and storage conditions (e.g., plant materials, tar heroin, cocaine base), the Supervisor or Manager will evaluate any changes in weight and determine if there is a change in weights that cannot be explained by packaging and storage conditions.

2. If the results of the original analysis and/or the original weights and the reanalysis and/or reweighing do not agree with each other, the Supervisor or Manager will evaluate the extent of the technical issue and may open a corrective action. (ISO/IEC 17025:2005 5.9.2).

3. Following the review by Supervisor or Manager, if no unexplained discrepancies are noted, the evidence is returned to the Evidence and Property Section for destruction. A list of these retested cases will be stored in the Managers records and or in LIMS.

END OF DOCUMENT
I. Policy: The Controlled Substance Unit has assessed estimated uncertainty for drug balances and the associated net weights of substances weighed on the balances. (ISO/IEC 17025:2005 5.4.6.2)

A. Drugs weights are considered to be a measurement that matters as legal enhancements may be charged if certain weight limits are exceeded.
   1. See DRG.33 for more information about enhancements.

B. All components of uncertainty for weighing suspected controlled substances which are of importance have been taken into account and the reporting of results will not give the wrong impression of uncertainty. (ISO/IEC 17025:2005 5.4.6.2, 5.4.6.3)
   1. Refer to DRG.42 and UM.01 for specific information including the sources contributing to the uncertainty.

C. Only net weights will have an associated uncertainty reported. The uncertainty for net weights will be reported in the "Annex to the Drug Report".
   1. See DRG.11 for more information
   2. The weight of the item based on the indication of the balance will be reported and the associated uncertainty will be reported. Examples include:
      a. Net Weight: 0.065 grams +/-0.011 grams
      b. Net Weight: 2.650 grams +/-0.062 grams
      c. Net Weight: 156.98 grams +/-0.41 grams
   3. For balances 1, 7, 8 and 12 the Manufacturer's specifications indicate the minimum quantity that should be weighed is 0.020 grams (20 milligrams). Substances below 20 milligrams will be reported as "residue".

D. Gross weights, estimated weights and volumes will be reported without an associated uncertainty.
   1. A statement included in the "annex to the report" will reflect that.

E. Uncertainty can be defined as:
1. Value that characterizes possible dispersion error around an assigned calibration or measurement value.

2. Technical use of the word "uncertainty" indicates a level of confidence in the result or the test being performed or the measurement.

3. Uncertainty of a measured value is an interval around that value such that any repetition of the measurement will produce a new result that lies within this interval. This uncertainty interval is assigned by the laboratory following established principles of uncertainty estimation.

4. The laboratory has attempted to take into account the extent to which the following factors contribute to the total uncertainty of measurement for weights in the uncertainty budget. (ISO/IEC 17025:2005 5.1.1, 5.1.2)
   a. Human Factors
   b. Accommodation and Environmental Conditions
   c. Test and Calibration Methods and Validation
   d. Equipment
   e. Sampling
   f. Handling of Test and Calibration Items

F. Traceability refers to an unbroken chain of comparisons using acceptable and documented methods to national or international standards (SI) with each comparison having stated uncertainties. The measurement is what is traceable.

G. Elements of Traceability:

1. An unbroken chain of comparisons: an unbroken chain of comparisons going back to national (NIST) or international (SI) standards.
   a. See "Balance Traceability" diagram in DRG.42.

2. Measurement uncertainty: the measurement uncertainty for each step of the traceability chain must be calculated and reported so that an overall uncertainty may be estimated.
   a. See DRG.42 for details.

3. Documentation: each step of the chain must be performed according to documented procedures, and the results must be documented.
   a. Detailed procedures on documentation are included in the relevant documents of the Technical Unit Manual.

4. Competence: the laboratory performing calibrations in the chain must supply evidence of technical competence (e.g., ISO/IEC 17025 accreditation).

5. Reference to SI units: where possible the chain of comparisons must end at the primary standards for the realization of the SI units (e.g. BIPM).
   a. Heusser Neweigh, is the Laboratory approved external vendor for calibrations of the weight reference standards and balances. The vendor is accredited by A2LA and meets ISO/IEC 17025 subcontractor requirements for maintaining traceability. See DRG.04.
6. Recalibration at appropriate intervals: calibration must be repeated at appropriate intervals depending on the uncertainty required.
   a. See DRG.18 for details.

7. Measurement Assurance: An evaluation process that validates and verifies steps 1-6 listed above.
   a. The process uncertainty is included in DRG.42.
   b. The Laboratory performs monthly calibration checks of the balances.

H. The Controlled Substance Unit has assessed the uncertainty for qualitative identification of substances. Following an appropriately structured analytical scheme will effectively result in no uncertainty in reported identifications. Reference: SWGDRUG Recommendations, 5th Edition, 2010-01-29, PART III B - Methods of Analysis/Drug Identification

1. Qualitative analysis or the identification of seized drugs requires the combination of methods to form an analytical scheme.

2. Individual methods have limitations and, consequently, uncertainty. Uncertainty of qualitative methods is not typically expressed in numerical terms.

3. Understanding these limitations enables the laboratory or analyst to build an appropriate analytical scheme to correctly identify a drug or chemical.

4. It is expected that an appropriate analytical scheme will effectively result in no uncertainty in reported identifications.

5. Relevant limitations of an analytical scheme (e.g., inability to differentiate isomers, unavailability of reference material) may be documented and included in the report.

END OF DOCUMENT
I. The following is a detailed explanation of the uncertainty budget for drug weights.

A. The balances in the Controlled Substance Unit are used to weigh out suspected controlled substances for the purpose of reporting the net weight.

1. Balances 1, 7, 8 and 12 have been grouped as they are from the same manufacturer, have the same model number and similar characteristics and display resolution.

2. Balances 1, 7, 8, and 12 have different uncertainties based on two threshold weight limits, equal to or below 28 grams and above 28 grams. These thresholds were selected based on data the Laboratory gathered during the measurement assurance process study.

3. Balance 13 has its own estimated measurement uncertainty budget.

B. NIST 8-step approach to estimating uncertainty:

1. Specify the measurement process

   \[ y = (mx+b) +/− U^* \]

   where:
   - \( y \) is the balance indication,
   - \( m \) is the sensitivity of the weighing device,
   - \( x \) is the applied load,
   - \( b \) is the zero offset, and
   - \( U \) is the assigned measurement uncertainty

   Ideally, \( b = 0 \) if the balance indication was properly zeroed, and \( m \sim 1 \) because the balance indicates one mass unit for each mass unit applied.

   *reference NIST IR 6919

2. Identify and characterize the uncertainty sources

   a. The Laboratory used "fishbone diagrams" and used brainstorming techniques to identify possible sources of error.

   b. See "Fishbone Diagram" at the bottom of the document.

3. Quantify uncertainty measurements

   a. The Laboratory uses "grams" for the estimated measurement uncertainty SI units.

4. Convert factors to standard uncertainties

   a. The Laboratory converted factors to standard uncertainties, one standard deviation equivalents, based on the distribution (normal or rectangular distribution) and multiplier of the "source of " data.

5. Calculate combined standard uncertainties

   a. The Laboratory uses the "root sum square" equation.

6. Expand the uncertainty by "k"
a. The coverage factor is the multiplier used to establish the confidence level reported.

b. The Laboratory uses a coverage factor of $k=3$, approximately 99.73.

7. **Evaluate the expanded uncertainty**

   a. The Laboratory evaluated the data and used Pareto charts to help visualize the significance of the contributing sources of uncertainty. The Laboratory plans to reevaluate the budget on an annual basis. If there is a change in the measurement process or the measurement instruments, the quarterly measurement assurance will be evaluated to determine if the changes are significant enough to require a full budget reevaluation.

8. **Report the uncertainty**

   a. The estimated measurement uncertainty for net weighing of controlled substances will be reported by the Laboratory in accordance with the procedures in the *Controlled Substance Unit SOP*. The report will state that upon request, additional work may be done to obtain a net weight with associated estimated measurement uncertainty for any previously reported gross or estimated weights.

   b. Weight results will be reported as indicated on the balance. Measurement uncertainty estimates will be reported to two significant digits, rounding up unless the third digit is a zero (“GUM rounding”).

   c. The estimated uncertainty of the measurement has been calculated with approximately a 99.7% confidence using the root sum squares method. The uncertainty estimate includes type A uncertainty components, assuming a normal distribution, and type B uncertainty components.

      i. **Estimated Controlled Substances Measurement Uncertainties:**

         1. **Drug Balance (#1, 7, 8, 12: PB303-S) Budget:** weights under 28 grams (any weighing media): ± 0.013 grams

         2. **Drug Balance (#1, 7, 8, 12: PB303-S) Budget:** weights over 28 grams (any weighing media): ± 0.36 grams

         3. **Drug Balance (#13: EP4102) Budget:** ± 0.31 grams

C. The following is an explanation of each line item:

1. **Line 1: Check weight**

   The Laboratory performs a monthly check at two different masses for each balance.

   - Balances 1, 7, 8 and 12 use the 100 mg and 10 gram reference standards.

   - Balances 13 uses the 50 gram and 1000 gram reference standards.

   a. **Drug Balance (#1, 7, 8, 12: PB303-S) Budget below 28 g--Any Weigh Media:** The Laboratory includes the calibration uncertainty of the reference standard closest to an enhancement value. (eg. the enhancement weight for Heroin is approximately half an ounce). The 10 gram reference standard was used in the estimated measurement uncertainty budget for the higher end.

   b. **Drug Balance (#1, 7, 8, 12: PB303-S) Budget above 28 g--Any Weigh Media:** The Laboratory includes the uncertainty of the largest reference standard used in the monthly checks. The 10 g reference standard calibration uncertainty was used in the Laboratory's estimated measurement uncertainty budget.

   c. **Drug Balance (#13: EP4102) Budget:** The Laboratory includes the uncertainty of the largest weight that is checked monthly. The Laboratory includes the 1000 gram reference standard in the estimated measurement uncertainty budget.

   The Laboratory evaluates the ISO 17025 compliant calibration certificates from Rice Lake for all reference standards available for use. The most recent calibration data was used.
For the estimated uncertainty budget, the uncertainty is expressed as mass (g). The data is derived from a calibration certificate therefore it is a Type B uncertainty component and the Expanded Multiplier = 2, as stated on the certificate, and the distribution is normal (Divisor = 1).

2. **Line 2: Balance Reproducibility, Monthly Checks**

The Laboratory includes reproducibility by evaluating the monthly internal check data. The Laboratory calculates the standard deviation for the same reference standard that was used in "Line Item #1" for the reasons stated above.

The Laboratory evaluates monthly check data beginning with the first professional calibration (data kept in the Balance Log). This check encompasses multiple analysts and a variety of environmental conditions over an extended period of time. The standard deviation of the value obtained for the reference standard is calculated.

   a. **Drug Balance (#1, 7, 8, 12: PB303-S) Budget above 28 g - Any Weigh Media**: The 10 gram check is evaluated. The largest standard deviation is included in the estimated measurement uncertainty budget.

   b. **Drug Balance (#1, 7, 8, 12: PB303-S) Budget below 28 g - Any Weigh Media**: The 100 mg check is evaluated. The largest standard deviation is included in the estimated measurement uncertainty budget.

   c. **Drug Balance (#13: EP4102) Budget**: The standard deviation for the 1000 gram check weight is included in the estimated measurement uncertainty budget.

For the estimated measurement uncertainty budget, the uncertainty is expressed as mass (g). The data is derived from an internal measurements therefore it is a Type A uncertainty component and the Expanded Multiplier = 1, and the distribution is normal (Divisor = 1).

3. **Line #3: Temperature Shifts in the Laboratory**

The Laboratory includes the temperature uncertainty for a 10 °C shift in temperature. This is due to the fact that the building is climate controlled and should be between 65-75 °C. The Laboratory took the sensitivity drift in ppm/°C from the manufacturer's technical data sheets for each model of balance. For Balance #13, the manufacturer's technical data was not obtainable. The lab uses an estimate obtained from a balance of similar capacity.

For the estimated measurement uncertainty budget, the uncertainty is expressed as mass (g). The data is derived from a manufacturer's data applied to a temperature range therefore it is a Type B uncertainty component and the Expanded Multiplier = 1, and the distribution is rectangular (Divisor = sq. root of 3).

4. **Line #4: Instrument Readability at "zero"** & **Line #5: Instrument Readability at "load"**

The Laboratory includes the readability of the drug balances. The resolution varies by model of the balance. Instrument readability is calculated by dividing the resolution of the balance by 2 x sq. root of 3.

   a. **Drug Balance (#1, 7, 8, 12: PB303-S) Budget above 28 g - Any Weigh Media**

   b. **Drug Balance (#1, 7, 8, 12: PB303-S) Budget below 28 g - Any Weigh Media**, and

   The resolution is 0.01 grams.

For the estimated measurement uncertainty budget, the uncertainty is expressed as mass (g). The data is derived from a calculation using the resolution of the balance, it is a Type B uncertainty component and the Expanded Multiplier = 1, and the distribution is rectangular (Divisor = sq. root of 3).
Note: The readability of the balance at "zero" and "load" are both included as there are rounding errors associated with each weighing event in the process of weighing suspected controlled substances.

5. Line #6: Balance Calibration The Laboratory uses the estimated measurement uncertainty (expanded) from the most recent ISO 17025 compliant calibration certificate from Heusser-Neweigh. For the four balances (#1, 7, 8 and 12) at drug stations, the largest uncertainty is included.

For the estimated measurement uncertainty budget, the uncertainty is expressed as mass (g). The data is derived from a calibration certificate therefore it is a Type B uncertainty component and the Expanded Multiplier = 2, as stated on the certificate, and the distribution is normal (Divisor = 1)

The Laboratory staff conducts measurement assurance to assess the uncertainty due to the process weighing casework samples. Static weighing (taring, removing the weighing media and loading the balance) is associated with a greater uncertainty than dynamic weighing (taring, leaving the weighing media on the balance and loading the balance). For the estimated measurement uncertainty budget, the uncertainty is expressed as mass (g). The data is derived from laboratory data therefore it is a Type A uncertainty component and the Expanded Multiplier = 1, and the distribution is normal (Divisor = 1).

a. Balances 1, 7, 8 and 12

For balances 1, 7, 8 and 12 the process uncertainty is assessed around the 1 ounce enhancement weight as well as weights around 1 gram. The measurement assurance (MA) data provides a threshold for uncertainty below 1 gram and above 1 gram.

i. Drug Balance (#1, 7, 8, 12: PB303-S) Budget above 28 g - Any Weigh Media: The lab created approximately 1 oz weight is evaluated in an ongoing MA. The largest standard deviation is included in the estimated measurement uncertainty budget.

ii. Drug Balance (#1, 7, 8, 12: PB303-S) Budget below 28 g - Any Weigh Media: The lab created approximately 1 gram weight is evaluated in an ongoing MA. The largest standard deviation is included in the estimated measurement uncertainty.

b. Balance 13

For balance 13 the process uncertainty is assessed around the enhancement weight of 1 ounce as well larger weights that may be encountered in casework, is around 1 lb. The standard deviation for the larger weight, (~ 1 lb), was greater than that of the smaller weight (~33 grams); thus the larger weight used during the study is included in the estimated measurement uncertainty budget (~1 lb). The different weighing media (metal bowls) typically used on this balance are evaluated.

i. Drug Balance (#13: EP4102) Budget: The lab created ~1 lb weight was evaluated using metal bowls. The largest standard deviation is included in the estimated measurement uncertainty budget.

7. Line #8: Limit of non-linearity error

The linearity is incorporated as the "tolerance" based on monthly checks performed on each balance. The manufacturer's specifications were evaluated and an administrative laboratory established allowable deviation was derived for each specific balance.

For the estimated measurement uncertainty budget, the uncertainty is expressed as mass (g). The data is Type B uncertainty with the Expanded Multiplier = 1 and the distribution is rectangular (Divisor = sq. root of 3).
II. Drug Balance

A. Explanation of Fishbone Diagram

The purpose a fishbone diagram is to attempt to identify and characterize possible sources of uncertainty. The following explanation details where these sources are accounted for in the Laboratory's estimated measurement uncertainty budget. The Laboratory attempts to account for each source on the fishbone diagram with at least one line item. There is not always a one-to-one relationship between the fishbone diagram and the line items.

1. Design:

   a. Capacity
      i. Evaluated from monthly checks done on the Drug balances as given under Line Item #2

   b. Sensitivity
      i. Evaluated from monthly checks done on the Drug balances as given under Line Item #2

   c. Draft Shield
      i. Evaluated from monthly checks done on the Drug balances as given under Line Item #2

   d. Reproducibility
      i. Evaluated from monthly checks done on the Drug balances as given under Line Item #2 and the Process uncertainty from Line Item #7

   e. Readability
i. Evaluated from the balance Readability at 0 and Readability at Load from Line Item #4 and 5

f. Manufacturer's Specification Followed
   i. addressed in Technical Unit Manual

2. Installation:
   a. Design
      i. Evaluated from monthly checks done on the Drug balances as given under Line Item #2 and the Process uncertainty from Line Item #7
   b. Foundation/Support
      i. Evaluated from monthly checks done on the Drug balances as given under Line Item #2 and the Process uncertainty from Line Item #7
   c. Reproducibility
      i. Evaluated from monthly checks done on the Drug balances as given under Line Item #2 and the Process uncertainty from Line Item #7

3. Staff: & Procedures
   a. Training (different staff)
   b. Experience (different staff)
      i. Evaluated from Process uncertainty given under Line Item #7
   c. Frequency of Test (# of data points generated during studies)
      i. Evaluated from monthly checks done on the Drug balances as given under Line Item #2 and the Process uncertainty from Line Item #7
   d. Frequency of Calibration/Calibration Checks
      i. Evaluated from monthly checks done on the Drug balances as given under Line Item #2 and the Balance Calibration data given under Line Item #6
   e. Using weigh paper/wax paper/weigh boats
      i. Evaluated Process uncertainty from Line Item #7 Line

4. Standards:
   a. Storage
      i. As addressed under Technical Unit Manual for reference standards or check weights
   b. Handling Conditions
      i. As addressed under Technical Unit Manual for reference standards
   c. Reported Uncertainty Tolerance
      i. Limit of Non-Linear Error was evaluated from Allowable tolerance for monthly check given under Line Item #8
   d. Use of Calibrated Values
      i. Evaluated from monthly checks done on the Drug balances given under Line Item #1 (Reference Standard Check Weight)

5. Facility:
a. **Temperature Stability**  
   i. Evaluated from the monthly Drug balance checks for reproducibility given under Line Item #2, the Effect of Changes in room Temperature on Balance under Line Item #3 and the Process uncertainty given under Line Item #7

b. **Drafts**  
   i. Evaluated from monthly checks done on the Drug balances as given under Line Item #2 and the Process uncertainty from Line Item #7

c. **Humidity**  
   i. Evaluated from monthly checks done on the Drug balances as given under Line Item #2 and the Process uncertainty from Line Item #7

d. **Vibration**  
   i. Evaluated from monthly checks done on the Drug balances as given under Line Item #2 and the Process uncertainty from Line Item #7

e. **Static Electricity**  
   i. Evaluated from monthly checks done on the Drug balances as given under Line Item #2 and the Process uncertainty from Line Item #7

6. **Method of Use**
   a. **Range of Use**
      i. Evaluated from monthly checks done on the Drug balances as given under Line Item #2 and the Process uncertainty from Line Item #7

   b. **Calibration Checks/Repair**
      i. Evaluated from monthly checks done on the Drug balances as given under Line Item #2 and the Balance Calibration data given under Line Item #6

   c. **Type of Product Weighed**
      i. Evaluated from Process uncertainty given under Line Item #7

   d. **Gross versus Net Weights**
      i. As addressed in Technical Unit Manual
Elements of traceability

1. An unbroken chain of comparisons: an unbroken chain of comparisons going back to national (NIST) or international (SI) standards.
   - See “Balance Traceability” diagram for traceability back to NIST via Hauser-Neveigh.
2. Measurement uncertainty: the measurement uncertainty for each step of the traceability chain must be calculated and reported so that an overall uncertainty may be estimated.
   - See the uncertainty budget which takes into account all estimated uncertainty at each step along the traceability chain.
3. Documentation: each step of the chain must be performed according to documented procedures, and the results must be documented.
   - See laboratory records for documentation. The reference for each element or line item in the uncertainty budget has been given.
4. Competence: the laboratory performing steps in the chain must supply evidence of technical competence (e.g., ISO/IEC 17025 accreditation).
   - Hauser-Neveigh, the Laboratory approved external vendor for calibration, is ISO/IEC 17025 accredited for weight reference standard and balance calibrations.
5. Reference to SI units: where possible, the chain of comparisons must end at the primary standards for the realization of the SI units (e.g., BIPM).
   - Hauser-Neveigh, the Laboratory approved external vendor for calibration, is ISO/IEC 17025 accredited by A2LA and has established traceability to the appropriate SI units.
6. Recalibration at appropriate intervals: calibration must be repeated at appropriate intervals depending on the uncertainty required.
   - The Laboratory has Standard Operating Procedures (SOP) for recalibration of balances and reference standards (check weights) at regular intervals.
   - The Laboratory evaluates process uncertainty and included the uncertainty due to the process of weighing in the budget.
   - The Laboratory checks the calibration of the balances at regular intervals (monthly checks).

END OF DOCUMENT
I. Policy: The training protocol for controlled substance analysis will be used to train Criminalists in knowledge, skills and abilities prior to being authorized to perform casework analysis.

A. General Information

1. Due to the educational requirements, the Training Manual requires that the trainee already possess a thorough knowledge of scientific technique, chemical principles, and instrumentation.

2. It is intended to acquaint the trainee with the more common controlled substances, cutting agents, precursors, and byproducts in use at the present.

3. The trainee is expected to become familiar with all the methods of analysis for each controlled substance encountered in these exercises.

   a. **Use very small amounts of drugs in these exercises.** Pure compounds of many of these drugs are hard to acquire and typically results/data can be obtained with a few grains of the material.
b. Closely examine every piece of glassware or disposable lab equipment used in an analysis to rule out any contamination.

c. When possible practical hands-on training will be provided for each technique expected to use during casework

4. The drug analysis training program includes many controlled substances that are commonly found in the drugs currently seen on the streets. Drugs trends may shift over time and often come back into fashion based upon cost, availability, supply and demand. Because recreational use, abuse and manufacturing of drugs is constantly changing, the Training Manual must also change regularly to keep up with any trends.

5. The trainee is encouraged to ask questions of the analyst's trainer and others.

6. The trainee must use the laboratory literature references and personal resources as well as any formal training.

7. The trainee must use pharmaceutical references when identifying licit pills, capsules, and tablets:
   a. Trainee will learn the proper note taking and report writing procedures for pharmaceuticals.
   b. Trainee will learn the limitations of certain types of illicit pills, capsules and tablets.
   c. The trainee will learn the proper steps for presumptive and confirmatory identification.

B. Safety

1. The trainee will use appropriate personal protective equipment to comply with the safe handling of chemicals, biohazards and Sharps hazards.

2. Some drugs or solvents will absorb through the skin. Other drugs are fine powders and form small dust clouds, which could be inhaled, if not handled gently.

3. Although unlikely to occur, be extremely careful with loaded syringes (prepackaged) and any other sharps. Safety protection is the responsibility of the criminalist.

4. The trainee will review the appropriate Forensic Services Division Safety Manual (SAF.01 to SAF.34) procedures that are applicable to the work being done in the Controlled Substances Unit.

C. Educational Requirements:

1. Analysts working in the Controlled Substance discipline shall possess a baccalaureate or an advanced degree in a natural science, criminalistics or a closely related field.

D. Time-frame and Training Binder

1. Training is intended to be self-paced. The trainee should utilize the time allowed for training effectively and diligently.

2. This training protocol will require eight to ten weeks to complete, not including the competency samples. To successfully complete the training and competency samples, the trainee must allow sufficient time for this training. The time frame
indicated for each section, is the maximum time that it should take to complete that section.

3. Any schedule deviations must be addressed as soon as possible with the Manager/Supervisor and instructor so that adjustments may be made.

4. A training binder must be prepared during the course of this training protocol. This training binder should include the following for each group of compounds tested:
   a. Appropriate notes obtained from instructor
   b. Results of all screening tests
   c. Gas Chromatography/Mass Spectrometry (chromatograms and spectra)
   d. IR spectra
   e. Reading list
   f. Record of training including in-house training and any classes or meetings attended.

5. This training binder shall be turned in and reviewed prior to issuing the competency samples.
   a. The supervisor will evaluate the training binder to determine the readiness of trainee to take the competency.
   b. The training binder will be evaluated for:
      i. Completeness of each module (required substances tested)
      ii. Acceptability of Chromatographic, Mass Spectra, and Infrared Spectroscopy data
      iii. Reading list
      iv. Successful completion of questions from each module
      v. Documentation of any practice or mock casework completed

E. References Utilized During Training

1. Controlled Substance Monographs
   a. Marijuana (MONO.MAR)
   b. Phenethylamines (MONO.PHEN)
   c. Phenethylamine Analogs (MONO.ANALOGS)
   d. Caines (MONO.COC) (Note: Review special criteria for reporting cocaine salt vs. cocaine base and the need to compare unknown FTIR spectra to both salt and base forms)
   e. Benzodiazepines (MONO.BEN)
   f. LSD (MONO.LSD) (Note: Review special criteria for reporting LSD or LAMPA by comparing to a standard with both LSD and LAMPA)
   g. PCP and Dissociative Anesthetics (MONO.PCP)
   h. Tryptamines (MONO.TRY)
i. Steroids ([MONO.STE])

j. GHB ([MONO.GHB])

k. Opiates ([MONO.OPI])

l. Barbiturates ([MONO.BAR])

2. Training Modules

a. Barbiturate ([DRG.44])

b. Benzodiazepines ([DRG.45])

c. Caines ([DRG.46])

d. GHB ([DRG.47])

e. LSD ([DRG.48])

f. Marijuana ([DRG.49])

g. Opiates ([DRG.50])

h. PCP ([DRG.51])

i. Analogs ([DRG.52])

j. Phenethylamines ([DRG.53])

k. Steroids ([DRG.54])

l. Tryptamines ([DRG.55])

m. Miscellaneous & No Common Controlled Substances ([DRG.56])

3. Literature References (see drug monographs and [DRG.06])

4. Training authorization checklist(s) to document progression and authorization to perform specific tasks (see [DRGF.29]).

5. Controlled Substance Procedures

F. Training Goals:

1. To develop skills in the area of controlled substance analysis culminating in the ability to perform casework independently

2. To understand and implement the policies and procedures in the Controlled Substance and Division manual to perform casework in accordance with approved policies and procedures

3. To gain expertise and knowledge and use of instrumentation culminating in the ability to troubleshoot and perform routine maintenance on instrumentation ([DRG.19])

4. To gain expertise in the area of controlled substance analysis enabling analysis of complex casework

5. To gain expertise in courtroom testimony through knowledge and experience

G. Effectiveness of Training:
1. The training programs may evolve as needed with the addition of new instrumentation and/or new techniques, the effectiveness of the training program will be evaluated when the Controlled Substance Unit Manual is periodically evaluated and additions or deletions to the training program will be documented. The following are the training actions and can be used to evaluate the effectiveness of training:

   a. On-the-job training as indicated in the documented training program
   
   b. Review of Unit SOP as well as training materials indicated in the documented training program
   
   c. Practical and written exercises as indicated in the documented training program
   
   d. Competency testing prior to assuming casework responsibilities
   
   e. 100% technical and administrative review of casework
   
   f. Goals set for the analyst to increase responsibility, technical expertise, knowledge and skills as indicated in the documented training program
   
   g. Mock court exercises
   
   h. Court training and court critiques
   
   i. On-going training, including outside training classes
   
   j. Feedback from the trainee regarding in-house and outside training
   
   k. Yearly performance evaluation that includes setting goals for the analyst, review of SOQ, and training binder. This assessment reviews analyst goals for development and evaluates the effectiveness of training actions and if further training actions are needed.
   
   l. Review of mock practice casework will be done prior to the start of a competency test.

      i. Practice casework will mimic the flow of evidence, analysis of evidence, entering results into LIMS, and generating a report.

      ii. Practice casework should be provided at the conclusion of larger drug modules to ensure understanding and allow the analyst to practice using drug unit instrumentation and LIMS. Practice casework for smaller modules may be combined.

      iii. A single lab number may be used to document practice case work (with different requests for each module).

      iv. Feedback will be provided on each practice request that is completed by the reviewer/trainer.

   m. Review of the Training Assessment Questions will be done prior to the start of a competency test.

2. **Training Assessment Questions:** The following questions will be answered and given to the Trainer/Supervisor for review to assess whether the knowledge acquired during training was sufficient to begin the trainee's competency test.
a. The questions and practical exercises below may be expanded upon by the Supervisor/Trainer or designee.

b. The Training Assessment Questions are open book, however, the analyst trainee will answer each question in their own words.

c. The trainer will assess the trainee's knowledge and understanding from the Training Assessment Questions to determine if the trainee is ready for the competency. An unsuccessful assessment will require further remedial training in the areas that were deficient.

d. The criminalist will receive written feedback from their trainer.

e. **Questions:**

i. **Evidence Handling/Case Examination**

   1. Explain the difference between item and unit.
   2. Define the following abbreviations:
      
      1. ZLPB
      2. PB
      3. MARQ
      4. CS
      5. CF
      6. MDMA
      7. REP
      8. PSB
      9. CM
      10. CAP
      11. EST
      12. LSD
      13. EXT
      14. ROTH
      15. 6-MAM
   3. Describe the procedure in examining multiple item cases and items with multiple units.
   4. Explain how the charge(s), location of evidence, and evidence appearance may or may not influence the analysis of the evidence.
   5. What is a proper seal on evidence?
   6. How is an improper seal remediated?
7. How would you handle a discrepancy with evidence?
8. What special steps should be taken for a case that is considered a biohazard?
9. How is a laboratory report and notes packet distributed upon request by an attorney?

ii. Sample Preparation
1. Describe how a solvent used to extract the unknown affects the recovery of the compound and chromatography.
2. Describe when to basify a sample to extract phenethylamines in a solvent like petroleum ether or chloroform.
3. Describe how to prepare liquid substances for GC/MS analysis.

iii. Presumptive and Confirmatory Analysis
1. Define presumptive test and give examples.
2. Which color tests would you use for the following compounds, Methamphetamine, Cocaine, and Heroin. Why?
3. What does the Rothera reagent test for?
4. What are the botanical features of Cannabis leaves?
5. Why must the injection port and the oven be heated?
6. Define relative retention time.
7. How does the split ratio of the method affect the results?
8. Define mass spectrum, relative abundance, base peak and molecular ion.
9. How are the items (mass spectrum, relative abundance, base peak and molecular ions) evaluated to help identify compounds?
10. What criteria must be met to call solid or liquid substances "No common controlled substances detected"?

iv. General Knowledge?
1. Give the rationale on how drugs are scheduled.
2. Explain and give examples of why same drugs are in multiple schedules.
3. Differentiate between Cocaine Base and Cocaine Salt. (differences in schedule, chemistry, reactions, results from analysis etc.)
4. Classify the following drugs with the appropriate drug categories. (Drug Categories are: Depressants, Stimulants, Hallucinogens, Dissociative Anesthetics, Narcotics, Inhalants, Cannabis, Not controlled)
   1. Methamphetamine
2. Cocaine
3. Heroin
4. Secobarbital
5. Hydromorphone
6. Lorazepam
7. Methylenedioxyamphetamine
8. Carisprodol
9. LSD
10. Ketamine
11. Codeine
12. DMSO
13. GHB

H. Competency Test:
   1. See DRG.49 and DRG.57 for specific information regarding the Competency Tests.

I. Maintenance of skills and re-training:
   1. An analyst can maintain their skills by:
      a. Routine performance of casework
         i. Analysts should endeavor to analyze a wide variety of types of casework when possible. Supervisor may assign/re-assign casework to ensure opportunities are available to all analysts.
         ii. If an analyst has not done any casework for an extended period of time, the supervisor may require refresher training and/or a proficiency test.
            1. This may depend on the amount of previous experience of analyst, length of absence from casework, number and significance of changes implemented in the unit during the absence, emergence of new drugs, and discussion between analyst and supervisor about readiness to perform all types of casework.
            2. Refresher training may include review of relevant policies, analysis of case-like materials, observation of or by another experienced analyst.
      b. Professional development can include training and workshops related to controlled substance analysis or instrumentation
      c. Reading literature
      d. Participation in a professional organization related to controlled substance analysis
2. Maintenance of skills can be monitored through multiple sources
   a. Annually, a proficiency test is required when working in the drug unit; this is a demonstration of maintenance of skills.
   b. Casework is 100% technically and administratively reviewed. Repeated instances of cases being returned for failing to follow policy guidelines or requiring further analysis could indicate a need for refresher or remedial training.
   c. Courtroom testimony monitoring from court critiques or observation by others with technical knowledge in controlled substances.

3. If technical issues arise from a proficiency test, courtroom testimony monitoring or 100% technical review of casework, the Manager or Supervisor may require remedial training in any of the areas listed below. The remedial training will be documented and may include:
   a. Repeating a subject area in part or in its entirety
   b. Review of relevant policies and procedures
   c. Analysis of case-like materials
   d. Observation of analyst by supervisor or another experienced analyst
   e. Proficiency or competency exam

J. New Equipment and/or Methodologies
   1. Training will be provided on any new equipment or methodology.
   2. A competency will be given when new equipment and/or methodologies are introduced to the laboratory that are significantly different from equipment and/or methodologies that the analyst was previously deemed competent and authorized to use for casework.
   3. The need for a competency will be evaluated by the Supervisor/Manager.
   4. The extent of the competency will be evaluated by the Supervisor/Manager. At minimum the competency will include:
      a. An examination of sufficient unknowns to cover the anticipated spectrum of casework and evaluate the individual's ability to perform proper testing methods.
         i. Passing criteria may depend on the type of equipment or methodology being used. The supervisor will advise the analyst of the criteria prior to administering the competency.
      b. A written report will be generated to demonstrate the individual's ability to properly convey results.
      c. A written or oral exam to assess the individual's knowledge of the category of testing or task being performed. The exam will test both technical knowledge and the ability to provide court testimony.

K. Scope of Training:
   1. Marijuana
2. General Controlled Substance Analysis
   a. Phenethylamines
   b. Caines
   c. Opiates
   d. Tryptamines
   e. Benzodiazepines
   f. Lysergic Acid Diethylamide (LSD)
   g. Phencyclidine and Analogs
   h. Amphetamine Analogs
   i. Barbiturates
   j. Steroids
   k. GHB
   l. Miscellaneous Compounds

3. Theory and Operation of the equipment and/or software used for confirmatory analysis including:
   a. Gas Chromatograph/Mass Spectrometer:
      i. Gas Chromatography/Mass Spectrometry (GC/MS) is a specific method of identification for most solid dosage drugs.
      
      ii. A sample is passed through a gas chromatographic column, effecting a separation of the components of the sample. The individual compounds then move into the mass spectrometer source where they are bombarded by electrons, producing charged ions. The ions of interest are positively charged fragments of the original compound.
      
      iii. The ions are then separated, through a mass filtering process, according to their mass-to-charge ratios (m/z) and then collected by a detector. In the detector, the ions are converted to a proportional electrical current.
      
      iv. The data system records the magnitude of these electrical signals as a function of m/z and converts this information into a mass spectrum. The mass spectrum is a record of the different ions (m/z) and the relative numbers of each ion (abundance). These spectra are characteristic for individual compounds, giving specificity for most types of drug substances.
      
      v. Confirmation of an unknown spectrum is done by direct comparison with a known or reference spectrum
      
      vi. Limitations and Benefits of GCMS:
         1. MS can not differentiate between optical isomers (e.g. Pseudo/Ephedrine)
         2. Due to certain method parameters (inlet temperature causing structural changes; GHB->GBL) certain compounds can not be
identified.

3. Depending on the structure of the molecule, the amount and type of fragmentation will vary. Due to this, some drugs do not exhibit a molecular ion using electron impact mass spectrometry.

4. Due to instrument parameters, types of instrument tunes, and abundances of signals, compound spectra can vary in ion proportions. Consider the type of instrument, tunes, reference source, and dilutions to make proper comparisons of spectral data. Analyzing standards on same instrument, with the same methods, and dilution within close proximity of the unknown analysis will give the best comparable data to evaluate identification.

b. **Fourier Transform Infrared Spectrophotometer:**

i. Infrared spectroscopy (IR) is a specific method of identification in most instances and is therefore a desirable analytical tool for the forensic drug chemist.

ii. This method of spectral analysis is based on the molecular vibrational energies of an organic compound. Infrared light containing wavelengths from 4000 cm⁻¹ to 400 cm⁻¹ is generated and passed through the sample. When the frequency of light matches a frequency of vibration within the molecule, absorption occurs. The absorptions are translated electronically and recorded on a data system. The resulting spectrum will have characteristic bands corresponding to each different vibration among atoms in the molecule.

iii. The IR spectrum of an unknown compound can be compared to the IR spectrum of a known or reference spectrum for confirmation.

iv. The Fourier Transform Infrared Spectrophotometer (FTIR) collects the composite spectrum in the time domain and mathematically transforms it to the frequency domain.

v. Spectra may be collected using an Attenuated Total Reflectance (ATR) accessory and compared to standards also collected utilizing the ATR.

vi. Limitations and Benefits:

1. All case samples submitted may not be pure enough to perform analysis.

2. An extra cleanup procedure may be necessary to prepare sample for analysis by FTIR (see DRG.29).

3. Ready Checks and background checks must be run to ensure instrument is in working order for each analysis.

4. Some samples are routinely more pure than other. Samples like Methamphetamine often require little preparation to examine the substance, thereby speeding up the analysis time.

c. **Stereomicroscope (Marijuana only)**

i. Adjusting the coarse and fine focus
ii. Adjusting the object on the stage to obtain the characteristics desired within view

iii. Proper care and maintenance of the stereomicroscope

4. Theory and Use of equipment used for weighing:
   a. Balances (See DRG.18 )
   b. Residues (See DRG.41 )
   c. Measurement Traceability and Uncertainty of Measurement (See FSD.28 and DRG.41)

5. Theory and Use of chemical presumptive tests (color tests)
   a. Many substances give distinct color results when tested with various chemical reagents. In many cases, the color reaction produced is not specific to a single drug but rather a class of drugs.
   b. The Laboratory uses presumptive color tests to both indicate classes of drugs which may be present in a sample as well as eliminate classes of drugs.
   c. Color test results are generally immediate and the immediate color reaction is what should be noted.
   d. Care should be taken as the color obtained from any test may vary with the age of the reagent, the amount of drug used, the conditions of the test and the presence of extraneous material in the test sample that may give color test results or mask color test results.
   e. Very small amounts of material are generally needed to produce positive color test results. Although some exceptions may apply.

6. Proper evidence handling procedures including (DRG.09 ):
   a. opening evidence
   b. selection of items to examine
   c. marking of items
   d. storage of evidence
   e. disposition of evidence

7. Proper note-taking and recordation of examination records (DRG.10)
   a. recording handwritten and/or electronic notes (use of LIMS)

8. Proper report writing
   a. entering results into LIMS (DRG.38)

9. Court Procedures
   a. Presentation of Evidence in Court
      i. Trainer should provide an overview of court expectations beyond technical knowledge - such as communicating effectively, appropriate clothing and demeanor
1. Formal training classes may be available
   
ii. Analyst may observe testimony of another experienced analyst
   
iii. Analyst will participate in a mock court

b. Controlled substance evidence is most typically used in criminal proceedings and are classified in different schedules (I-V)
   
   i. Trainee should be shown resources to determine the schedule of a controlled substance and related charges
      
      1. Monographs may contain some information related to criminal charges and California offense codes as well as scheduling information

   ii. Differences can exist between California and federal law
      
      1. Federal law has procedures for the emergency scheduling of substances on a temporary basis. Federal scheduling of substances may change more frequently than California scheduling.

   iii. Substances not specifically scheduled may fall under an analog law

   c. Legal Proceedings

      i. Subpoenas and Discoveries
      
      ii. Business record/official record/public record
         
         1. Custodian of records
         
         2. Confrontation Clause - Melendez-Diaz

      iii. Criminal Proceedings
         
         1. Juvenile Court
         
         2. Preliminary Hearings
         
         3. 402 Hearings
         
         4. Trials

      iv. Civil Proceedings
         
         1. Depositions
         
         2. Trials

      v. Expert Witness
         
         1. Voir Dire
         
         2. Role of the expert witness in court
         
         3. Evidence admissibility (Frye, Daubert)

   10. Application of Ethics in Forensic Science
a. Controlled Substances are considered to have a greater potential for theft or abuse
   i. Common issues in controlled substance analysis include dry labbing, theft and use of controlled substances
   ii. Trainer should review issues related to laboratory scandals involving controlled substance analysis and the impact on the court system
   iii. Because of the sensitive issues related to controlled substances, analyst should be diligent in reporting any unauthorized access or discrepancies in amounts of standards or evidence
   iv. For more information about ethics training see FSD.21.

11. **General Knowledge** of Forensics

   a. Analysts should develop a general knowledge of other forensic disciplines that may process drug evidence or often be related to drug evidence such as:
      i. Latent prints
      ii. Biology/DNA
      iii. Toxicology
         1. Toxicology involves drugs, uses similar instrumentation and is often related to drug cases. Analyst should have an understanding of the differences in analysis, how instruments are used and reporting of results for toxicology evidence compared to drug evidence.
      iv. Firearms

   b. This knowledge may be obtained from a variety of sources
      i. Formal education in Criminalistics or Forensic Science
      ii. Supplemental reading of general forensic texts
      iii. Observation of analysts in other disciplines at the laboratory
      iv. Certification that has a general knowledge requirement

L. The training program may be abbreviated for analysts with previous experience in drug analysis.

   1. It is at the discretion of the Supervisor or Manager to abbreviate the training program based on previous experience.
   2. If the program is abbreviated, the previous experience will be documented.
   3. Successful completion of the competency test is required before assuming casework responsibilities
   4. Practical exercises and answers to the Training Assessment Questions (in DRG.57) will be reviewed and the analyst will be provided written feedback by the Supervisor or designee prior to starting the competency.
   5. At minimum the competency will include:
a. A Test of Knowledge (closed book) will be provided with the following criteria:
   i. Refer to DRG.57 for the scoring criteria for evaluation of the Test of Knowledge.

b. An examination of sufficient unknowns to cover the anticipated spectrum of casework and evaluate the individual's ability to perform proper testing methods.

c. A written report will be generated to demonstrate the individual's ability to properly convey results.

d. A written or oral exam to assess the individual's knowledge of the category of testing or task being performed and the ability to provide court testimony.

M. Authorization for the Controlled Substances Unit.

1. The use of the authorization checklist in conjunction with the documented training program is the manner in which management can ensure the competence of all who operate specific equipment, perform tests, and sign reports.

2. Training must be done in accordance with the documented training program.

3. The training checklist(s) will document an analyst's competence to operate specific equipment, perform tests, evaluate results, sign test reports.

4. A checkmark in the "analyst" column indicates that the analyst has completed training in area indicated. A checkmark in the "Trainer" column indicates who provided and supervised the training.

5. Personnel will be qualified on the basis of appropriate education, training as described in the training manual, and successful completion of competency tests that demonstrate skills acquired.

END OF DOCUMENT
I. Policy: The training program will be used for training Criminalists in the knowledge, skills and abilities necessary for barbiturates analysis.

A. Barbiturate Modules (approximately 2 days)

1. Module I: Reading
   a. Criminalist will review material in MONO.BAR and its bibliography.

2. Module II: Color Tests
   a. Instructor will demonstrate screening tests for barbiturates.
   b. Criminalist will perform screening tests on all of the following, if the laboratory has reference materials available:
      i. Phenobarbital *
      ii. Secobarbital *
      iii. Amobarbital *
      iv. Aprobarbital
      v. Barbital
      vi. Butabarbital *
      vii. Butalbital
      viii. Hexobarbital
      ix. Pentobarbital *
      x. Thiopental
xi. Hydantoin
xii. Diphenlyhydantoin
c. the theory and use of Color Tests: benefits and limitations of presumptive color tests
d. what constitutes a positive reaction
   i. see MONO.BAR
e. how to document the results of the color test in casework
   i. see DRG.10
f. how to make the reagents
   i. see DRG.13
g. how to check and verify the reagents and how to document that information
   i. see DRG.13
   ii. see DRGF.13 and DRGF.28
h. the laboratory procedure for routinely checking the reliability of the reagents
   i. see DRG.13

3. **Module III: GC/MS**
   a. Criminalist will produce acceptable GC/MS spectra of controlled drugs marked with an *, if the laboratory has reference materials available
      i. the theory and use of GC/MS (Gas Chromatography/Mass Spectrometry): benefits and limitations of GC/MS
      ii. how to run a sample on the GC/MS
         1. see DRG.25
      iii. how to set up a sequence on the GC/MS
         1. see DRG.25
      iv. what standards are run (how often)
         1. see DRG.12
      v. how to perform data analysis
         1. see DRG.25
      vi. how to use the libraries
         1. see DRG.34
      vii. how to document the results of the analysis in casework
         1. see DRG.10
   viii. maintenance
1. see DRG.17
2. see DRG.19

4. **Module IV: Pharmaceutical References**
   a. Instructor will demonstrate the use of the pharmaceutical references and proper documentation.
   b. How to document use of reference collection in notes and report
      i. see DRG.34 for guidelines for presumptive and confirmatory identification
      ii. see DRG.38 for instructions of the proper entry into LIMS

5. **Module V: Study Topics**
   a. Criminalist will answer Study Topics in MONO.BAR

6. **Module VI: Competency Test**
   a. The barbiturates may be included in the Competency Test for Controlled Substances following the completion of training on all the different drug groups.

7. **Miscellaneous**
   a. The theory and use of balances:
      i. proper weighing technique, see DRG.18
      ii. uncertainty/accuracy of the balance-how the results are recorded in the notes and on the report
      iii. laboratory procedures for routinely checking the accuracy of the balances (see DRG.18)
      iv. the location of balance logs
   b. Proper itemization of evidence, see DRG.38

8. **Authorization**
   a. See DRGF.29 to see the Barbiturate Training Authorization Checklist.

END OF DOCUMENT
I. Policy: The training program will be used for training Criminalists in the knowledge, skills and abilities necessary for benzodiazepine analysis.

A. Benzodiazepine Modules (approximately 2 days)

1. **Module I: Reading**
   a. Criminalist will review material in MONO.BEN and its bibliography.

2. **Module II: Color Tests**
   a. Instructor will demonstrate screening tests for Diazepam and Chlordiazepoxide.
   b. Criminalist will perform screening tests on all of the following, if the laboratory has reference materials available:
      i. Diazepam *
      ii. Chlordiazepoxide *
      iii. Prazepam
      iv. Flurazepam *
      v. Lorazepam
      vi. Oxazepam *
      vii. Clonazepam *
      viii. Halazepam *
      ix. Chlorazepate
      x. Alprazolam *
xi. Temazepam *

c. the theory and use of Color Tests: benefits and limitations of presumptive color tests

d. what constitutes a positive reaction
   i. see MONO.BEN

e. how to document the results of the color test in casework
   i. see DRG.10

f. how to make the reagents
   i. see DRG.13

g. how to check and verify the reagents and how to document that information
   i. see DRG.13
   ii. see DRGF.13 and DRGF.28

h. the laboratory procedure for routinely checking the reliability of the reagents
   i. see DRG.13

3. **Module III: GC/MS**

   a. Criminalist will produce acceptable GC/MS spectra of all controlled drugs marked with an *, if the laboratory has reference materials available
      i. the theory and use of GC/MS (Gas Chromatography/Mass Spectrometry): benefits and limitations of GC/MS
      ii. how to run a sample on the GC/MS
         1. see DRG.25
      iii. how to set up a sequence on the GC/MS
         1. see DRG.25
      iv. what standards are run (how often)
         1. see DRG.12
      v. how to perform data analysis
         1. see DRG.25
      vi. how to use the libraries
         1. see DRG.34
      vii. how to document the results of the analysis in casework
         1. see DRG.10
      viii. maintenance
         1. see DRG.17
2. see DRG.19

4. **Module IV: Pharmaceutical References**
   a. Instructor will demonstrate the use of the pharmaceutical references and proper documentation.
   b. How to document use of reference collection in notes and report
      i. see DRG.34 for guidelines for presumptive and confirmatory identification
      ii. see DRG.38 for instructions of the proper entry into LIMS

5. **Module V: Study Topics**
   a. Criminalist will answer Study Topics in MONO.BEN

6. **Module VI: Competency Test**
   a. The benzodiazepines may be included in the Competency Test for Controlled Substances following the completion of training on all the different drug groups.

7. **Miscellaneous**
   a. The theory and use of balances:
      i. proper weighing techniques: (see DRG.18)
      ii. uncertainty/accuracy of the balance-how the results are recorded in the notes and on the report
      iii. laboratory procedures for routinely checking the accuracy of the balances (see DRG.18)
      iv. the location of balance logs
   b. Proper itemization of evidence, see DRG.38

8. **Authorizations**
   a. See DRGF.29 for Benzodiazepine Training Authorization Checklist.

END OF DOCUMENT
I. **Policy:** The training program will be used for training Criminalists in the knowledge, skills and abilities necessary for performing caine analysis.

   A. **Caines Module (approximately 1-2 weeks)**

   1. **Module I: Reading**
      
   a. Criminalist will review material in MONO.COC bibliography.

   2. **Module II: Color Tests**
      
   a. Instructor will demonstrate screening tests for cocaine salt and cocaine base

   b. Criminalist will perform screening tests on all of the following, if the laboratory has reference materials available:
      
   i. Cocaine *
   ii. Tetracaine
   iii. Mepivicaine
   iv. Benzoylecgonine *
   v. Ecognine *
   vi. Benzocaine
   vii. Piperocaine
   viii. Procaine
   ix. Lidocaine
c. the theory and use of Color Tests: benefits and limitations of presumptive color tests

d. what constitutes a positive reaction
   i. see MONO.COC

e. how to document the results of the color test in casework
   i. see DRG.10

f. how to make the reagents
   i. see DRG.13

g. how to check and verify the reagents and how to document that information
   i. see DRG.13
   ii. see DRGF.13 and DRGF.28

h. the laboratory procedure for routinely checking the reliability of the reagents
   i. see DRG.13

3. Module III: GC/MS and FTIR

   a. Criminalist will produce acceptable GC/MS spectra of all drugs listed above marked with *, if the laboratory has reference materials available
      i. the theory and use of GC/MS (Gas Chromatography/Mass Spectrometry): benefits and limitations of GC/MS
      ii. how to run a sample on the GC/MS
         1. see DRG.25
      iii. how to set up a sequence on the GC/MS
         1. see DRG.25
      iv. what standards are run (how often)
         1. see DRG.12
      v. how to perform data analysis and proper annotation
         1. see DRG.25
      vi. how to use the libraries

         1. see DRG.10
      viii. maintenance
         1. see DRG.17
         2. see DRG.19
b. Criminalist will produce acceptable IR spectra of cocaine salt and cocaine base
   i. the theory and use of FTIR (Fourier Transform Infra Red) Spectrophotometry: benefits and limitations of FTIR
   ii. how to run a sample on the FTIR
       1. see DRG.28
   iii. how to prepare samples for analysis
       1. see DRG.29 for both UATR, KBr pellet, and vapor cell sample preparation.
       2. Analyst will document practice presumptive identification for at least one cocaine sample using KBr pellet sample preparation.
       3. see MONO.COC for clean-up procedures and distinguishing between cocaine salt and cocaine base as well as annotation of peaks
   iv. how to run standards (how often)
       1. see DRG.12
   v. how to document the results of the analysis in casework
       1. see DRG.10
   vi. maintenance
       1. see DRG.17
       2. see DRG.30

4. Module IV: Making Cocaine Base
   a. Instructor may demonstrate the procedure(s) by which cocaine base is illicitly produced.
   b. Criminalist may prepare a small portion of cocaine base using one of the methods demonstrated by the instructor.

5. Module V: Study Topics
   a. Criminalist will answer Study Topics in MONO.COC

6. Module VI: Competency Test
   a. The caines may be included in the Competency Test for Controlled Substances following the completion of training on all the different drug groups.

7. Miscellaneous
   a. The theory and use of balances:
      i. proper weighing techniques: (see DRG.18)
      ii. uncertainty/accuracy of the balance-how the results are recorded in the notes and on the report
iii. Laboratory procedures for routinely checking the accuracy of the balances (see DRG.18)

iv. The location of balance logs

b. Proper itemization of evidence, see DRG.38

8. Authorizations

a. See DRGF.29 Caines Training Authorization Checklist

## Training: GHB

### I. Policy:

The training program will be used for training Criminalists in the knowledge, skills and abilities necessary for performing analysis of GHB and related drugs. *(Supplemental 5.2.1.1)*

#### A. GHB Module (approximately 2 days)

1. **Module I: Reading**
   
a. Criminalist will review material in MONO.GHB and its bibliography.

2. **Module II: Color Tests**
   
a. Instructor will demonstrate screening tests
   
b. Criminalist will perform screening tests
   
   i. the theory and use of Color Tests: benefits and limitations of presumptive color tests
   
   ii. what constitutes a positive reaction
       
       1. see MONO.GHB
   
   iii. how to document the results of the color test in casework
       
       1. see DRG.10
   
   iv. how to make the reagents
1. see DRG.13

v. how to check and verify the reagents and how to document that information
   1. see DRG.13
   2. see DRGF.13 and DRGF.28

vi. the laboratory procedure for routinely checking the reliability of the reagents
   1. see DRG.13

3. **Module III: GC/MS and FTIR**
   a. Criminalist review GC/MS data for GHB and Analogs
   b. Criminalist may produce GC/MS data for GHB both underivatized and derivatized (refer to MONO.GHB)
      i. the theory and use of GC/MS (Gas Chromatography/Mass Spectrometry): benefits and limitations of GC/MS
      ii. how to run a sample on the GC/MS
         1. see DRG.25
      iii. how to set up a sequence on the GC/MS
         1. see DRG.25
      iv. what standards are run (how often)
         1. see DRG.12
      v. how to perform data analysis
         1. see DRG.25
      vi. how to use the libraries
         1. see DRG.34
      vii. how to document the results of the analysis in casework
         1. see DRG.10
   c. Criminalist may be instructed to produce acceptable spectra by FTIR
      i. the theory and use of FTIR (Fourier Transform Infra Red) Spectrophotometry: benefits and limitations of FTIR
      ii. how to run a sample on the FTIR
         1. see DRG.28
iii. how to prepare samples for analysis
   1. see DRG.29

iv. how to run standards (how often)
   1. see DRG.12

v. how to document the results of the analysis in casework
   1. see DRG.10

vi. maintenance
   1. see DRG.17
   2. see DRG.30

4. Module IV: Study Topics
   a. Criminalist will answer Study Topics in MONO.GHB

5. Module V: Competency Test
   a. GHB or related compounds may be included in the Competency Test for Controlled Substances following the completion of training on all the different drug groups.

6. Miscellaneous
   a. The theory and use of balances:
      i. proper weighing techniques: (see DRG.18)
      ii. uncertainty/accuracy of the balance-how the results are recorded in the notes and on the report
      iii. laboratory procedures for routinely checking the accuracy of the balances (see DRG.18)
      iv. the location of balance logs
   b. Proper itemization of evidence, see DRG.38

7. Authorizations
   a. See DRGF.29 GHB Training Authorization Checklists.

END OF DOCUMENT
I. Policy: The training program will be used for training Criminalists in the knowledge, skills and abilities necessary for performing analysis of LSD and related compounds. (Supplemental 5.2.1.1)

   A. LSD Modules (approximately 2 days)

   1. Module I: Reading
      a. Criminalist will review material in MONO.LSD and its bibliography.

   2. Module II: Color Tests
      a. Instructor will demonstrate screening tests for LSD.
      b. Criminalist will perform screening tests on the following:
         i. LSD
         ii. LAMPA
            1. the theory and use of Color Tests: benefits and limitations of presumptive color tests
            2. what constitutes a positive reaction
               1. see MONO.LSD
            3. how to document the results of the color test in casework
               1. see DRG.10
4.  how to make the reagents
   1.  see DRG.13

5.  how to check and verify the reagents and how to document that information
   1.  see DRG.13
   2.  see DRGF.13 and DRGF.28

6.  the laboratory procedure for routinely checking the reliability of the reagents
   1.  see DRG.13

3.  **Module III: GC/MS and FTIR**

a.  Criminalist will produce acceptable GC/MS spectra of the drugs listed above
   i.  the theory and use of GC/MS (Gas Chromatography/Mass Spectrometry): benefits and limitations of GC/MS

   ii.  how to run a sample on the GC/MS
        1.  see DRG.25

   iii.  how to set up a sequence on the GC/MS
        1.  see DRG.25

   iv.  what standards are run (how often)
        1.  see DRG.12

   v.  how to perform data analysis
        1.  see DRG.25

   vi.  how to use the libraries
        1.  see DRG.34

   vii.  how to document the results of the analysis in casework
        1.  see DRG.10

   viii. maintenance
        1.  see DRG.17
        2.  see DRG.19

b.  Criminalist may be instructed to produce acceptable spectra by FTIR
   i.  the theory and use of FTIR (Fourier Transform Infra Red Spectrophotometry): benefits and limitations of FTIR

   ii.  how to run a sample on the FTIR
        1.  see DRG.28

   iii.  how to prepare samples for analysis
1. see DRG.29

iv. how to run standards (how often)
   1. see DRG.12

v. how to document the results of the analysis in casework
   1. see DRG.10

vi. maintenance
   1. see DRG.17
   2. see DRG.30

4. **Module IV: Study Topics**
   a. Criminalist will answer Study Topics in MONO.LSD

5. **Module V: Competency Test**
   a. LSD or related compounds may be included in the Competency Test for Controlled Substances following the completion of training on all the different drug groups.

6. **Miscellaneous**
   a. LSD samples are typically prepared as "dosage units" for consumption.
      i. the number of blotter papers, window panes, cubes or other "dosage units" should be included on the report
      ii. the estimated size of the "dosage unit" should be included in the notes
   b. Proper itemization of evidence, see DRG.38

7. **Authorizations**

   END OF DOCUMENT
I. Policy: The marijuana training program will be used for training Criminalists in the knowledge, skills and abilities necessary for performing casework on suspected marijuana (plant material) and samples suspected to contain cannabinoids.

A. Marijuana Modules: (approximately 1-2 weeks)

1. Module I: Reading
   a. Criminalist will review material in MONO.MAR and its bibliography

2. Module II: Botanical Features
   a. Instructor will review Botanical Features of Marijuana
   b. Instructor will demonstrate botanical characteristics of marijuana plant (microscopic and macroscopic) and demonstrate Duquenois-Levine test.

3. Module III: Stereomicroscopy and Color Tests
   a. Examination of Marijuana and Botanicals: Criminalist will examine botanical standards and marijuana samples selected from cases in order to develop the ability to distinguish marijuana from other commonly encountered green plant material.
   b. Instructor will demonstrate the Duquenois-Levine test.
   c. Duquenois-Levine test will be performed on samples:
      i. the theory and use of Color Tests: benefits and limitations of presumptive color tests
      ii. what constitutes a positive reaction
         1. see MONO.MAR
iii. how to document the results of the color test in casework
   1. see DRG.10

iv. how to make the reagents
   1. see DRG.13

v. how to check and verify the reagents and how to document that information
   1. see DRG.13
   2. see DRGF.13 and DRGF.28

vi. the laboratory procedure for routinely checking the reliability of the reagents
   1. see DRG.13

d. Stereomicroscopy will be performed on samples: The theory and use of Stereomicroscope will include:
   i. the benefits and limitations of Stereomicroscope
   ii. the morphological features on the leaf necessary for a positive identification
      1. see MONO.MAR

iii. how to document the results of the analysis in casework
   1. see DRG.10

iv. instructions for use:
   1. place the sample to be examined on the viewing surface
   2. turn on the light
   3. adjust the magnification and resolution until the sample is clear
   4. a positive microscopic result is the presence of both clothing and cystolithic hairs

e. A number of plant fragments may be provided to be identified using only the stereo-microscope.

f. The use of mock practice casework to mimic the different casework sample types submitted
   i. see DRG.43 and DRG.10

4. Module IV: GC/MS

   a. Criminalist will use the GC/MS to confirm Cannabinoids: Samples will be analyzed by GC/MS and the theory and use of GC/MS (Gas Chromatography/Mass Spectrometry) will be covered:
      i. the theory and use of GC/MS (Gas Chromatography/Mass Spectrometry): benefits and limitations of GC/MS
ii. how to run a sample on the GC/MS
   1. see DRG.25

iii. how to set up a sequence on the GC/MS
   1. see DRG.25

iv. what standards are run (how often)
   1. see DRG.12

v. how to perform data analysis
   1. see DRG.25

vi. how to use the libraries
   1. see DRG.34

vii. how to document the results of the analysis in casework
   1. see DRG.10

viii. maintenance
   1. see DRG.17
   2. see DRG.19

5. Module V: Study Topics
   a. Criminalist will answer Study Topics in MONO.MAR

6. Module VI: Competency Test
   a. The analyst will complete a Test of Knowledge (closed book) which will be assessed by the following criteria:
      i. The criteria for evaluation will be a percentage of the total number of questions provided (i.e. 10 questions = 10 points per question). Trainee must receive \( \geq 80\% \) score on the Test of Knowledge to pass the written exam. Scores below 80% will be marked unsuccessful and will require documentation through a QA Action as well as further remedial training.

   b. The analyst will examine unknown competency samples.
      i. A number of case-like items will be provided to evaluate the analyst's ability to correctly identify controlled substances using the proper presumptive and confirmatory tests, and to properly document their examination results in a lab report.
         1. To successfully complete case-like samples, all controlled substances must be identified. Appropriate presumptive and confirmatory testing will be documented in same manner as casework analysis. See DRG.43.

   c. If the analyst does not successfully complete the competency, it will be documented in a QA Action. Remedial training will occur in which the trainer will demonstrate those techniques which resulted in the missed identification.
The analyst will then review those techniques for the appropriate compound(s). The analyst must then complete a second set of competency samples (the number of samples to be determined by the Manager/Supervisor). The second set of competency samples will need to be successfully completed as listed in the criteria above.

d. A laboratory report will be created by the Criminalist properly documenting the results of the analyses of unknowns. The laboratory report will be reviewed by the Trainer and/or Supervisor to ensure the correct procedures and techniques were used to identify the unknowns.

e. The analyst will complete a practical exercise for courtroom testimony with the Supervisor, Trainer, or designee.

f. Following the successful completion of competency test, the analyst may begin analysis of cases upon authorization from the Manager/Supervisor.

g. The analyst's first fifty (50) stereomicroscopic marijuana identifications must be contemporaneously reviewed (or verified) by a competency tested analyst who will be identified with their initials and date (or electronic equivalent) near the recorded results in the case notes.

7. Miscellaneous

a. The theory and use of balances:
   i. proper weighing techniques: (see DRG.18)
   ii. uncertainty/accuracy of the balance-how the results are recorded in the notes and on the report
   iii. laboratory procedures for routinely checking the accuracy of the balances (see DRG.18)
   iv. the location of balance logs

b. Proper itemization of evidence, see DRG.38

8. Authorizations

END OF DOCUMENT
I. Policy: The training program will be used for training Criminalists in the knowledge, skills and abilities necessary for performing Opiates analysis.

A. Opiates Module (approximately 1-2 weeks)

1. **Module I: Reading**
   a. Criminalist will review material in **MONO.OPI** and its bibliography.

2. **Module II: Color Tests**
   a. Instructor will demonstrate screening tests for heroin (powder and tar if available), morphine, and codeine.
   b. Criminalist will perform screening tests on all of the following, if the laboratory has reference materials available:
      i. Heroin (white powder, brown powder and tar if available)*
      ii. Morphine*
      iii. Codeine*
      iv. Hydrocodone* (aka dihydrocodeinone)
      v. Hydromorphone
      vi. Oxycodone*
      vii. Ethylmorphine
      viii. Didhydrocodeine*
     ix. Thebaine*
x. Papaverine*
xii. 6-monacetylmorphine*

xiii. Oxymorphone*
xiv. Apomorphine

xv. Acetylcodeine

xvi. Fentanyl*

xvii. Methadone*

xi. 6-monacetylmorphine*

xii. Oxymorphone*

xiii. Apomorphine

xiv. Acetylcodeine

xv. Methadone*

xvi. Meperidine*

xvii. Fentanyl*

c. The theory and use of Color Tests: benefits and limitations of presumptive color tests

d. what constitutes a positive reaction
   i. see MONO.OPI

e. how to document the results of the color test in casework
   i. see DRG.10

f. how to make the reagents
   i. see DRG.13

g. how to check and verify the reagents and how to document that information
   i. see DRG.13
   ii. see DRGF.13 and DRGF.28

h. the laboratory procedure for routinely checking the reliability of the reagents
   i. see DRG.13

3. Module III: GC/MS

a. Criminalist will produce acceptable GC/MS spectra of controlled drugs marked with an *, if the laboratory has reference materials available

b. Criminalist will perform an acceptable qualitative chromatographic analysis of opium for review by the instructor. Such analysis will include reference materials-standards. (refer to MONO.OPI for laboratory minimum criteria for what constitutes Opium)

   i. The theory and use of GC/MS (Gas Chromatography/Mass Spectrometry): benefits and limitations of GC/MS

   ii. how to run a sample on the GC/MS
      1. see DRG.25

   iii. how to set up a sequence on the GC/MS
      1. see DRG.25

   iv. what standards are run (how often)
1. see DRG.12

v. how to perform data analysis
   1. see DRG.25

vi. how to use the libraries
   1. see DRG.34

vii. how to document the results of the analysis in casework
   1. see DRG.10

viii. maintenance
   1. see DRG.17
   2. see DRG.19

4. Module IV: Pharmaceutical References
   a. Instructor will demonstrate the use of the pharmaceutical references and proper documentation.
   b. How to document use of reference collection in notes and report
      i. see DRG.34 for guidelines for presumptive and confirmatory identification
      ii. see DRG.38 for instructions of the proper entry into LIMS

5. Module V: Study Topics
   a. Criminalist will answer Study Topics in MONO.OPI

6. Module VI: Competency Test
   a. The opiates may be included in the Competency Test for Controlled Substances following the completion of training on all the different drug groups.

7. Miscellaneous
   a. The theory and use of balances:
      i. proper weighing techniques (see DRG.18)
      ii. uncertainty/accuracy of the balance-how the results are recorded in the notes and on the report
      iii. laboratory procedures for routinely checking the accuracy of the balances (see DRG.18)
      iv. the location of balance logs
   b. Proper itemization of evidence, see DRG.38

8. Authorizations
   a. See DRGF.29 Opiates Training Authorization Checklists.
I. Policy: The training program will be used for training Criminalists in the knowledge, skills and abilities necessary for performing analysis of PCP and related compounds. (Supplemental 5.2.1.1)

A. Phencyclidine (PCP) and Disassociative Anesthetics (approximately 2 days)

1. Module I: Reading
   a. Criminalist will review material in MONO.PCP and its bibliography.

2. Module II: Color Tests
   a. Instructor will demonstrate screening tests for PCP.
   b. Criminalist will perform screening tests on the following, if the laboratory has reference materials available.
      i. PCP (Phencyclidine)*
      ii. PCC (Piperidinocyclohexanecarbonitrile)*
      iii. Ketamine*
   c. the theory and use of Color Tests: benefits and limitations of presumptive color tests
   d. what constitutes a positive reaction
      i. see MONO.PCP
   e. how to document the results of the color test in casework
i. see DRG.10

f. how to make the reagents
   i. see DRG.13

  
g. how to check and verify the reagents and how to document that information
   i. see DRG.13
   ii. see DRGF.13 and DRGF.28

h. the laboratory procedure for routinely checking the reliability of the reagents
   i. see DRG.13

3. Module III: GC/MS and FTIR
   
a. Criminalist will produce acceptable GC/MS spectra of controlled drugs listed above marked with an *
      i. the theory and use of GC/MS (Gas Chromatography/Mass Spectrometry): benefits and limitations of GC/MS
      
i. how to run a sample on the GC/MS
         1. see DRG.25
      
    iii. how to set up a sequence on the GC/MS
         1. see DRG.25
      
    iv. what standards are run (how often)
         1. see DRG.12
      
    v. how to perform data analysis
         1. see DRG.25
      
    vi. how to use the libraries
         1. see DRG.34
      
    vii. how to document the results of the analysis in casework
         1. see DRG.10
      
    viii. maintenance
         1. see DRG.17
         2. see DRG.19

b. Criminalist may be instructed to produce acceptable spectra by FTIR
   i. the theory and use of FTIR (Fourier Transform Infra Red) Spectrophotometry: benefits and limitations of FTIR
   
   ii. how to run a sample on the FTIR
        1. see DRG.28
iii. how to prepare samples for analysis
   1. see DRG.29

iv. how to run standards (how often)
   1. see DRG.12

v. how to document the results of the analysis in casework
   1. see DRG.10

vi. maintenance
   1. see DRG.17
   2. see DRG.30

4. **Module IV: Study Topics**
   a. Criminalist will answer Study Topics in MONO.PCP

5. **Module V: Competency Test**
   a. PCP or related compounds may be included in the Competency Test for Controlled Substances following the completion of training on all the different drug groups.

6. **Miscellaneous**
   a. The theory and use of balances:
      i. proper weighing techniques: (see DRG.18)
      ii. uncertainty/accuracy of the balance-how the results are recorded in the notes and on the report i
      iii. laboratory procedures for routinely checking the accuracy of the balances (see DRG.18)
      iv. the location of balance logs
   b. Proper itemization of evidence, see DRG.38

7. **Authorizations**
   a. See DRGF.29 PCP Training Authorization Checklist.

   END OF DOCUMENT
### I. Policy

The training program will be used for training Criminalists in the knowledge, skills and abilities necessary for phenethylamine analog analysis. *(Supplemental 5.2.1.1)*

#### A. Phenethylamine Analogs (approximately 2 days)

1. **Module I: Reading**
   
   a. Criminalist will review material in MONO.ANALOGS and its bibliography.

2. **Module II: Color Tests**
   
   a. Instructor will demonstrate screening tests for MDA and MDMA.

   b. Criminalist will perform screening tests on the following, if the laboratory has reference materials available.
      
      i. MDMA (3,4-methylenedioxymethamphetamine)
      
      ii. MDA (3,4-methylenedioxymethamphetamine)
      
      iii. 2,5-DMA (2,5-dimethoxyamphetamine)
      
      iv. MDE (3,4-methylenedioxyethylamphetamine)
      
      v. DOB (2,5-dimethoxy-4-bromoamphetamine)
      
      vi. STP/DOM (2,5-dimethoxy-4-methylamphetamine)
      
      vii. 2CT-7
      
      viii. BZP (Benzylpiperazine)
ix. cathinone
x. methcathinone
xi. ethylene
xii. methylone (MDMC)
xiii. fluoroamphetamine
xiv. fluoromethamphetamine

c. the theory and use of Color Tests: benefits and limitations of presumptive color tests
d. what constitutes a positive reaction
   i. see MONO.ANALOGS
e. how to document the results of the color test in casework
   i. see DRG.10
f. how to make the reagents
   i. see DRG.13
g. how to check and verify the reagents and how to document that information
   i. see DRG.13
   ii. see DRGF.13 and DRGF.28
h. the laboratory procedure for routinely checking the reliability of the reagents
   i. see DRG.13

3. Module III: GC/MS and FTIR
a. Criminalist will produce acceptable GC/MS spectra of all controlled drugs listed above that the Laboratory has available
   i. the theory and use of GC/MS (Gas Chromatography/Mass Spectrometry): benefits and limitations of GC/MS
   ii. how to run a sample on the GC/MS
      1. see DRG.25
   iii. how to set up a sequence on the GC/MS
      1. see DRG.25
   iv. what standards are run (how often)
      1. see DRG.12
   v. how to perform data analysis
      1. see DRG.25
   vi. how to use the libraries
1. see DRG.34

vii. how to document the results of the analysis in casework
   1. see DRG.10

viii. maintenance
   1. see DRG.17
   2. see DRG.19

b. Criminalist may be instructed to produce acceptable spectra by FTIR
   i. the theory and use of FTIR (Fourier Transform Infra Red) Spectrophotometry: benefits and limitations of FTIR
   ii. how to run a sample on the FTIR
      1. see DRG.28
   iii. how to prepare samples for analysis
      1. see DRG.29
   iv. how to run standards (how often)
      1. see DRG.12
   v. how to document the results of the analysis in casework
      1. see DRG.10
   vi. maintenance
      1. see DRG.17
      2. see DRG.30

4. **Module IV: Study Topics**
   a. Criminalist will answer Study Topics in MONO.ANALOGS

5. **Module V: Competency Test**
   a. The phenethylamine analogs may be included in the Competency Test for Controlled Substances following the completion of training on all the different drug groups.

6. **Miscellaneous**
   a. The theory and use of balances:
      i. proper weighing techniques: (see DRG.18)
      ii. uncertainty/accuracy of the balance-how the results are recorded in the notes and on the report
      iii. laboratory procedures for routinely checking the accuracy of the balances (see DRG.18)
      iv. the location of balance logs
b. Proper itemization of evidence, see DRG.38

7. Authorizations
   a. See DRGE.29 Analog Training Authorization Checklist.

   END OF DOCUMENT
I. Policy: The training program will be used for training Criminalists in the knowledge, skills and abilities necessary for phenethylamine analysis.

A. Phenethylamine Modules (approximately 1-2 weeks)

1. Module I: Reading
   a. Criminalist will review material in MONO.PHEN and its bibliography.

2. Module II: Color Tests
   a. Instructor will demonstrate screening tests for amphetamine and methamphetamine
   b. Criminalist will perform screening tests on all of the following:
      i. Amphetamine *
      ii. Methamphetamine *
      iii. Ephedrine *
      iv. Phenylpropanolamine
      v. Caffeine
      vi. Phenmetrazine
      vii. Phendimetrazine *
      viii. Pseudoephedrine
      ix. Diphenhydramine
      x. Methylphenidate *
xi. Niacinamide

xii. Phentermine*

xiii. Mephentermine*

1. the theory and use of Color Tests: benefits and limitations of presumptive color tests

2. what constitutes a positive reaction

   1. see MONO.PHEN

3. how to document the results of the color test in casework

   1. see DRG.10

4. how to make the reagents

   1. see DRG.13

5. how to check and verify the reagents and how to document that information

   1. see DRG.13

   2. see DRGF.13 and DRGF.28

6. the laboratory procedure for routinely checking the reliability of the reagents

   1. see DRG.13

3. Module III: GC/MS and FTIR

   a. Criminalist will produce acceptable GC/MS spectra of all drugs marked with an * in addition to caffeine and niacinamide.

      i. the theory and use of GC/MS (Gas Chromatography/Mass Spectrometry): benefits and limitations of GC/MS

      ii. how to run a sample on the GC/MS

         1. see DRG.25

      iii. how to set up a sequence on the GC/MS

         1. see DRG.25

      iv. what standards are run (how often)

         1. see DRG.12

      v. how to perform data analysis and proper annotation

         1. see DRG.25

      vi. how to use the libraries

         1. see DRG.34

      vii. how to document the results of the analysis in casework
1. see DRG.10

viii. maintenance
   1. see DRG.17
   2. see DRG.19

b. Criminalist may be instructed to produce acceptable spectra by FTIR
   i. the theory and use of FTIR (Fourier Transform Infra Red) Spectrophotometry: benefits and limitations of FTIR
   ii. how to run a sample on the FTIR
       1. see DRG.28
   iii. how to prepare samples for analysis
       1. see DRG.29
   iv. how to run standards (how often)
       1. see DRG.12
   v. how to document the results of the analysis in casework
       1. see DRG.10
   vi. maintenance
       1. see DRG.17
       2. see DRG.30

4. Module V: Study Topics
   a. Criminalist will answer Study Topics in MONO.PHEN

5. Module V: Competency Test
   a. The phenethylamines may be included in the Competency Test for Controlled Substances following the completion of training on all the different drug groups.

6. Miscellaneous
   a. The theory and use of balances:
      i. proper weighing techniques: (see DRG.18)
      ii. uncertainty/accuracy of the balance-how the results are recorded in the notes and on the report
      iii. laboratory procedures for routinely checking the accuracy of the balances (see DRG.18)
      iv. the location of balance logs
   b. Proper itemization of evidence, see DRG.38

7. Authorizations

END OF DOCUMENT
I. Policy: The training program will be used for training Criminalists in the knowledge, skills and abilities necessary for steroid analysis. (Supplemental 5.2.1.1)

A. Steroid Modules (approximately 2 days)

1. Module I: Reading
   a. Criminalist will review material in MONO.STE and its bibliography.

2. Module II: Color Tests
   a. Instructor will demonstrate screening tests for steroids.
   b. Criminalist will perform screening tests on all of the following:
      i. Testosterone *
      ii. Androsterone *
      iii. Oxymetholone
      iv. Nandrolone phenpropionate *
      v. Methandrostenolone *
      vi. Androstene 38, 178-diol Dipropionate
      vii. Methandriol
      viii. 17A-Methyltestosterone *
      ix. 19-Nortestosterone *
x. 19-Nortestosterone 17-Decanoate
xi. Stanozolol
xii. Testosterone Propionate *
xiii. Methenolone Acetate
xiv. Dihydroandrosterone
xv. Norethandrolone
xvi. Oxandrolone
xvii. Androstenediol
xviii. Boldenone Undecylenate
xix. Fluoxymesterone
xx. 5-Androstene 3, 17B-Diol *
xxi. Boldenone *
xxii. 4-Chlorotestosterone 17-acetate
xxiii. Mesterolone
xxiv. Testosterone 17B-Cypionate
xxv. Dihydrotestosterone Benzoate
xxvi. Testosterone Enanthate
c. the theory and use of Color Tests: benefits and limitations of presumptive color tests
d. what constitutes a positive reaction
   i. see MONO.STE
e. how to document the results of the color test in casework
   i. see DRG.10
f. how to make the reagents
   i. see DRG.13
g. how to check and verify the reagents and how to document that information
   i. see DRG.13
   ii. see DRGF.13 and DRGF.28
h. the laboratory procedure for routinely checking the reliability of the reagents

   1. see DRG.25

vi. how to use the libraries
   1. see DRG.34

vii. how to document the results of the analysis in casework
   1. see DRG.10

viii. maintenance
   1. see DRG.17
   2. see DRG.19

b. Criminalist may be instructed to produce acceptable spectra by FTIR
   i. the theory and use of FTIR (Fourier Transform Infra Red) Spectrophotometry: benefits and limitations of FTIR
   
   ii. how to run a sample on the FTIR
       1. see DRG.28

   iii. how to prepare samples for analysis
       1. see DRG.29

   iv. how to run standards (how often)
       1. see DRG.12

   v. how to document the results of the analysis in casework
       1. see DRG.10

   vi. maintenance
       1. see DRG.17
       2. see DRG.30

4. **Module IV: Study Topics**
   a. Criminalist will answer Study Topics in MONO.STE
5. **Module V: Competency Test**
   a. The steroids may be included in the Competency Test for Controlled Substances following the completion of training on all the different drug groups.

6. **Miscellaneous**
   a. Steroid samples are typically received as liquids or pills
   b. Proper itemization of evidence, See DRG.38
   c. Analytical procedures, See DRG.34

7. **Authorizations**

END OF DOCUMENT
I. Policy: The training program will be used for training Criminalists in the knowledge, skills and abilities necessary for Tryptamine analysis. (Supplemental 5.2.1.1)

A. Tryptamine Modules (approximately 3 days)

1. Module I: Reading
   a. Criminalist will review material in MONO.TRY and its bibliography.

2. Module II: Color Tests
   a. Instructor will demonstrate screening tests for tryptamines
   b. Criminalist will perform screening tests on all of the following:
      i. Psilocybin *
      ii. Psilocin *
      iii. Bufotenine *
      iv. Tryptamine
      v. Harmine
      vi. Harmaline
      vii. DMT * (Dimethyltryptamine)
      viii. DET * (Diethyltryptamine)
      ix. Ibogaine *
x. AMT (Alpha-Methyl-Tryptamine)
xi. 5-MeO-DIPT (5-Methoxy-N,N-diisopropyltryptamine)
 xii. 5-MeO-AMT (5-Methoxy-alpha-methyltryptamine)
 xiii. 5-MeO-DMT (5-Methoxy-n,n-dimethyltryptamine)
 xiv. 5-MeO-MiPT (5-Methoxy-N-methyl-N-isopropyltryptamine)

c. the theory and use of Color Tests: benefits and limitations of presumptive color tests
d. what constitutes a positive reaction
  i. see MONO.TRY
e. how to document the results of the color test in casework
  i. see DRG.10
f. how to make the reagents
  i. see DRG.13
g. how to check and verify the reagents and how to document that information
  i. see DRG.13
  ii. see DRGF.13 and DRGF.28
h. the laboratory procedure for routinely checking the reliability of the reagents
  i. see DRG.13

3. Module III: Botanical Features and Extraction Procedures
   a. Instructor will demonstrate the botanical characteristics of psilocybin containing mushrooms
   b. Criminalist will examine the botanical characteristics of psilocybin containing mushrooms, making notes and sketches as necessary.
   c. Instructor will demonstrate the extraction procedure(s) necessary to isolate psilocybin and psilocin from the plant material.
   d. Criminalist will perform an extraction procedure on a known sample, perform screening tests on it.

4. Module IV: GC/MS and FTIR
   a. Criminalist will produce acceptable GC/MS spectra of all drugs marked with an *
      i. The theory and use of GC/MS (Gas Chromatography/Mass Spectrometry): benefits and limitations of GC/MS
      ii. how to run a sample on the GC/MS
         1. see DRG.25
      iii. how to set up a sequence on the GC/MS
1. see DRG.25

iv. what standards are run (how often)
   1. see DRG.12

v. how to perform data analysis
   1. see DRG.25

vi. how to use the libraries
   1. see DRG.34

vii. how to document the results of the analysis in casework
   1. see DRG.10

viii. maintenance
   1. see DRG.17
   2. see DRG.19

b. Criminalist may be instructed to produce acceptable spectra by FTIR
   i. the theory and use of FTIR (Fourier Transform Infra Red) Spectrophotometry: benefits and limitations of FTIR
   ii. how to run a sample on the FTIR
      1. see DRG.28
   iii. how to prepare samples for analysis
      1. see DRG.29
   iv. how to run standards (how often)
      1. see DRG.12
   v. how to document the results of the analysis in casework
      1. see DRG.10
   vi. maintenance
      1. see DRG.17
      2. see DRG.30

5. Module V: Study Topics
   a. Criminalist will answer Study Topics in MONO.TRY

6. Module VI: Competency Test
   a. The tryptamines may be included in the Competency Test for Controlled Substances following the completion of training on all the different drug groups.

7. Miscellaneous
a. The theory and use of balances:
   i. proper weighing techniques: (see DRG.18)
   ii. uncertainty/accuracy of the balance-how the results are recorded in the
       notes and on the report
   iii. laboratory procedures for routinely checking the accuracy of the
        balances (see DRG.18)
   iv. the location of balance logs
b. Proper itemization of evidence, see DRG.38

8. Authorizations
   a. See DRGF.29 Tryptamine Training Authorization Checklist.

END OF DOCUMENT
I. Policy: The training program will be used for training Criminalists in the knowledge, skills and abilities necessary for analysis of miscellaneous compounds. Miscellaneous Controlled Compounds, or compounds not encountered during training, may be encountered in casework. These compounds may be identified by Criminalists if an appropriate analytical scheme is followed. Occasionally, samples are encountered in which no common controlled substance is detected; these samples are identified as "No Common Controlled Substance".

A. Miscellaneous Compounds and No Common Controlled Substances (approximately 1 day)

1. Module I: Reading

   a. There is no monograph for Miscellaneous Compounds or "No Common Controlled Substances". Clarke's or other references may be used for structure or solubility information regarding the Miscellaneous Compounds.

   b. Some long-eluting compounds are encountered in casework. If the DEA.m or other shorter method is used, the compounds may be seen in a later data file (e.g. blank) at the wrong retention time. Using longer, hotter methods such as GEN.m may allow them to be identified in the correct data file.

   i. sildenafil (non-controlled) (GEN.m or steroid.m)
   ii. tadalafil (non-controlled) (GEN.m or steroid.m)
   iii. quetiapine (non-controlled) (GEN.m or steroid.m)
   iv. buprenorphine (schedule V) (GEN.m or steroid.m)
   v. mitragynine (GEN.m or opiate.m or steroid.m)

2. Module II: Color Tests
a. Instructor will demonstrate screening tests for Methaqualone and any other Miscellaneous Compounds.

b. Criminalist will perform screening tests on all of the following, if the laboratory has reference materials available:
   i. aspirin *
   ii. acetaminophen *
   iii. methaqualone *
   iv. modafanil *
   v. diphenhydramine
   vi. guaifenesin
   vii. levamisole*
   viii. caffeine *
   ix. niacinamide
   x. dimethyl sulfone (DMSO) *

c. Instructor will explain color tests used to call a sample "No Common Controlled Substance"
   i. the theory and use of Color Tests: benefits and limitations of presumptive color tests
   ii. what constitutes a positive reaction
   iii. how to document the results of the color test in casework
      1. see DRG.10
   iv. how to make the reagents
      1. see DRG.13
   v. how to check and verify the reagents and how to document that information
      1. see DRG.13
      2. see DRGF.13 and DRGF.28
   vi. the laboratory procedure for routinely checking the reliability of the reagents
      1. see DRG.13

3. **Module III: GC/MS & FTIR**

   a. Criminalist will produce acceptable GC/MS spectra of controlled drugs and non controlled substances marked with an *, if the laboratory has reference materials available

   b. Instructor will explain solvents and GC/MS methods used to call a sample "No Common Controlled Substance" including using adequate amount of
solid samples (25-35 mg) and minimizing the amount of solvent used for dilution (5-8 drops). See DRG.34.

i. the theory and use of GC/MS (Gas Chromatography/Mass Spectrometry): benefits and limitations of GC/MS

ii. how to run a sample on the GC/MS
   1. see DRG.25

iii. how to set up a sequence on the GC/MS
   1. see DRG.25

iv. what standards are run (how often)
   1. see DRG.12

v. how to perform data analysis
   1. see DRG.25

vi. how to use the libraries
   1. see DRG.34

vii. how to document the results of the analysis in casework
   1. see DRG.10

viii. maintenance
   1. see DRG.17
   2. see DRG.19

c. Criminalist will produce acceptable IR spectra of controlled substances

i. the theory and use of FTIR (Fourier Transform Infra Red) Spectrophotometry: benefits and limitations of FTIR

ii. how to run a sample on the FTIR
   1. see DRG.28

iii. how to prepare samples for analysis
   1. see DRG.29 for both UATR, KBr pellet, and vapor cell sample preparation.
   3. see MONO.COC for clean-up procedures and annotation of peaks

iv. how to run standards (how often)
   1. see DRG.12

v. how to document the results of the analysis in casework
1. see DRG.10

vi. maintenance

1. see DRG.17

2. see DRG.30

4. Module IV: Study Topics

a. Criminalist may answer the following questions:

i. Explain why color tests may not match an analyte that you found on the GC/MS.

ii. What criteria would you use to evaluate a library match on GC/MS? On IR?

iii. You identify a substance by library match on GC/MS. What steps would you take to identify whether it is a controlled substance?

iv. You identify a substance by library match on GC/MS. How would you see whether the lab has a standard present to confirm?

v. What steps should be taken during sample preparation to ensure that you are likely to detect substances that may be present in low concentrations?

vi. What type of instrumental analysis must be done to report out "No Common Controlled Substances Detected"?

5. Module V: Competency Test

a. There is a combined competency test for "General Controlled Substance" analysis. See DRG.57.

6. Miscellaneous

a. The theory and use of balances:

i. proper weighing techniques: (see DRG.18)

ii. uncertainty/accuracy of the balance-how the results are recorded in the notes and on the report

iii. laboratory procedures for routinely checking the accuracy of the balances (see DRG.18)

iv. the location of balance logs

b. Proper itemization of evidence, See DRG.38

7. Authorizations

a. See DRGF.29 for Miscellaneous Compounds & No Common Controlled Substances Training Authorization Checklist.

END OF DOCUMENT
I. Policy: The general controlled substance training program will culminate in a competency that will test the Criminalist's knowledge, skills and abilities that are necessary for performing casework on samples suspected to contain controlled substances.

A. Criminalist may begin performing case work after successful completion of competency and upon authorization from the Manager/Supervisor.

1. The General Controlled Substance Analysis Competency Test may include drugs from the following groups:
   a. Phenethylamines
   b. Caines
   c. Opiates
   d. Tryptamines
   e. Benzodiazepines
   f. Lysergic Acid Diethylamide(LSD)
   g. Phencyclidine and Analogs
   h. Amphetamine Analogs
   i. Barbiturates
   j. Steroids
   k. GHB
   l. Miscellaneous Compounds
   m. No controlled Substance

2. In the competency, the Criminalist will receive 20 samples provided by the Manager/Supervisor or designee.
   a. Case samples or previously analyzed proficiency/competency samples may be used when any of the following steps are taken:
i. When previous case samples are used from our training stock, then a sample will be repackaged and renamed.

ii. The identifying information of a previously used Proficiency sample will be coded by assigning it a different Agency Case #. For e.g. a previously used ACN like CTS12-564 will be assigned an internal coded ACN with the unit and date - DRG-060412, ALC-060512 or TOX-060512 etc.

iii. Ensure any identifying information is obscured and re-name the sample.

iv. Place a portion into a separate container and re-name the sample.

3. Criminalist will analyze each of the samples to the fullest extent necessary to either:
   a. Identify the controlled substance(s) present
   b. Determine that no common controlled substances was detected

4. To successfully complete the competency samples, the criminalist must:
   a. All controlled substances must be identified. Appropriate presumptive and confirmatory testing will be documented in same manner as casework analysis. See DRG.43
   b. If a drug identification is missed or incorrect drug identification is made, then remedial training will occur and it will be documented in a QA Action.

5. If the criminalist does not successfully complete the competency samples due to "a" or "b" above, the instructor will demonstrate those techniques which resulted in the missed identification. The criminalist will then review those techniques for the appropriate compound(s). The criminalist must then complete a second set of competency samples (the number of samples to be determined by the Manager/Supervisor). The second set of competency samples will need to be successfully completed as listed in the criteria "a" and "b" above.

6. Written Report for General Controlled Substance Analysis Competency Test
   a. The Criminalist will prepare a written report of the results of the Competency Test to demonstrate the individual's ability to properly convey the results and conclusions of the analysis.
   b. The report should be generated in the same manner in which reports are generated for casework purposes.

7. General Controlled Substance Analysis Competency Test of Knowledge
   a. The Criminalist will complete a written examination as a Test of Knowledge.
      i. The Test of Knowledge is a closed book test.
      ii. The criteria for evaluation will be a percentage of the total number of questions provided (i.e. 25 questions = 4 points per
question). Trainee must receive ≥ 80% score on the Test of Knowledge to pass the written exam. Scores below 80% will be marked unsuccessful and will require documentation through a QA Action as well as further remedial training.

iii. The criminalist will receive written feedback from their trainer/Supervisor/Manager.

END OF DOCUMENT
I. Policy: These guidelines in conjunction with the *Forensic Services Division Safety Manual* will be followed to ensure employee safety within the laboratory.

A. Wear appropriate personal protective equipment when handling chemical and bio-hazardous materials. Consult the *Forensic Services Division Safety Manual* for further information. Safety Data Sheets (SDS), located in the laboratory technical units, should be consulted whenever using an unfamiliar chemical.

B. The following personal protection equipment should be worn at all times when working with or near hazardous substances or activities:
   1. Laboratory coat
   2. Latex or nitrile gloves
   3. Safety glasses or hood shield when mixing and preparing reagents

C. It is the responsibility of the analysts working within the lab to be familiar with the Division's Safety Manual and to comply with all safety requirements.

D. Special care will be taken with samples that may contain fentanyl or its analogs.
   1. Nitrile gloves will be used.
   2. Item packaging will be closed and workstation surfaces will be cleaned when leaving for a break or finishing analysis.
   3. Fine particulate or friable samples that can create an aerosol hazard pose additional consideration for protective equipment.
      a. Items will be opened in a hood.
      b. N95 respirators will be worn
   4. Some samples may not pose an aerosol threat such as tar-like substances, pills, and patches. Nitrile gloves should be worn and care should be taken with their handling. Double gloving can be performed as well.

E. When using "Sharps" or "Sharps Biohazard" bins for disposing of glassware or other "sharps", the bin should not be filled past the "fill line" indicated on the bin.

F. All bins need to be labeled appropriately (regardless of any markings on the bags inside the bins). This includes: "Biohazard", "Chemical Waste" and "Debris Waste".
1. typically, "chemical waste" consists of large amounts of chemicals like:
   a. corrosive acid inorganic waste or "acid waste"
   b. flammable organic waste or "organic waste"
   c. corrosive basic inorganic waste or "basic waste"

2. typically, hazardous waste solids or "debris waste" contains items with chemical residue (eg. slides, pipettes, spot plates etc).

3. biohazard waste consists of biohazard materials (eg. blood soaked gloves).
   a. gloves or "wipes" with small amounts of blood may be placed in the trash cans

G. Any larger container (e.g. 50 gallon drum) used to temporarily hold the bags of waste should also be labeled appropriately. This includes: "Biohazard", "Chemical Waste" and "Debris Waste".

END OF DOCUMENT
I. Policy: The following are forms used in the Controlled Substance Unit. Forms may be controlled (required for use) or non-controlled (suggested for use but not required).

A. Controlled forms are located on PowerDMS and must be used.
   1. Controlled Substance Training and Authorization (DRGF.29)

B. Non-controlled forms are located on PowerDMS or maintained within the Controlled Substance Unit and the minimum information that must appear on the form is listed below.
      a. Name of reagent
      b. Identity and lot numbers of chemicals
      c. Analyte used for verification
      d. Initials of person who prepared reagent and performed verification
      e. Retest date
      f. Initials, date and method of verification for retests
   2. Balance Calibration Check Log (DRGF.02)
      a. Date and Initials of person checking balance
      b. Instrument number and/or serial number
      c. Reference standards used to check balance
   3. Balance Maintenance Log (DRGF.03)
      a. Date and Initials of person performing maintenance
      b. The service needed or service performed/repair details
   4. GC/MS Weekly Check Log (DRGF.06)
      a. Date and Initials of person performing weekly check
      b. Instrument number and/or serial number
c. Indication when autotune was performed, septum was changed, liner was changed, and the pump oil was checked

d. Relative Retention Time (RRT) for target analyte(s)

5. GC/MS Service/Maintenance Log (DRGF.07)
   a. Date and Initials of person performing maintenance
   b. Instrument number and/or serial number
   c. The service needed or service performed with repair details
   d. If outside technician responded, what maintenance was performed

6. FTIR Weekly Check Log (DRGF.05)
   a. Date and Initials of person performing weekly ready checks, and an indication of whether the check was successful

7. FTIR Service/ Maintenance Log (DRGF.04)
   a. Date and Initials of person performing maintenance
   b. The service needed or service performed with repair details
   c. If outside technician responded, what maintenance was performed

8. Microscope Maintenance Log (DRGF.08)
   a. Date and Initials of person performing maintenance
   b. The service needed or service performed with repair details

9. Software Log (DRGF.12)
   a. Date and Initials of person filling out log
   b. Name and unique identifier of software
   c. Indication if a validation or verification was performed

10. Reference Material Verification Log (DRGF.09)
    a. Date and Initials of person checking reference material
    b. The manufacturer of the reference material
    c. The Lot identification number/vial number of the reference material
    d. The method used for verification

11. DPT Training Sample Verification Log
    a. Assigned lot number/vial number
    b. For each case used to create sample:
       i. Agency and case number
       ii. Item number and net weight
iii. For cases not previously analyzed - the date of verification, analyst, tests performed, and results
iv. For case previously analyzed the by laboratory - LIMS case number

12. Drug Usage Log (DRGF.10)
   a. Date and Initials of person using the reference material
   b. The name, vial number and location of the reference material being used
   c. The weight taken and any comments for the reason for use

   a. Date and Signature of person performing the technical and/or administrative review
   b. The laboratory number
   c. The elements that are being reviewed, which should correspond to the elements in the Controlled Substance policy on Technical and Administrative Review

14. Telephone Log
   a. The laboratory number, initials and date and pagination
   b. The name of the caller and the summary of the conversation
   c. If necessary, reference to a specific agency case number

15. Log of Quality Corrections (DRGF.27)
   a. Description of non-conformity
   b. Action or correction taken
   c. Analyst/Date

END OF DOCUMENT
I. The Controlled Substance Unit has quality procedures in place to ensure the reliability of test results.

A. Assuring the Quality of Test Results

1. The procedure for monitoring the validity of results can be found in DRG.34 and DRG.10

2. There is a 100% technical and administrative review by qualified personnel to ensure any trends are detectable as stated in DRG.14

3. The monitoring of all test results include but are not limited to the following:
   a. Use of reference materials or quality control materials. See DRG.12 References
   b. Use of alternative instrumentation that has been calibrated to provide traceable results. See DRG.18
   c. Functional check(s) of measuring and testing equipment. See DRG.18, DRG.19, and DRG.30
   d. Use of check or working standards with control charts, where applicable. See DRG.60 Measurement Assurance
   e. Intermediate checks on measuring equipment. See DRG.18, DRG.19, and DRG.30
   f. Replicate tests or calibrations using the same or different methods. See DRG.18
   g. Retesting of retained items. See DRG.40
   h. Review of reported results via technical and administrative review. See DRG.14
   i. Intralaboratory comparisons. See DRG.15

file:///G:/SupSvcsBur/LAB/CLERICAL UNIT/SB 978/FSD Controlled Substance Docs/Contra Costa_34.html
4. The validity and quality of test results are ensured in a variety of ways. If any issues arise from monitoring the quality control procedures listed above, the Supervisor or Manager will make a determination of the extent of the problem and take planned action. The following includes some, but not all, planned actions to correct any significant technical problems:

<table>
<thead>
<tr>
<th>Mechanism of Assuring Quality</th>
<th>Potential Actions to be Taken</th>
</tr>
</thead>
<tbody>
<tr>
<td>Regular use of verified reference materials for confirmation purposes</td>
<td>If reference materials are found to be unacceptable due to deterioration or contamination they will not be used for casework. The use of Standards is specified in the procedure, and their use is recorded in the case record. See DRG.34 and DRG.10 respectively.</td>
</tr>
<tr>
<td>Participation in externally provided proficiency tests</td>
<td>If a significant technical issue arises from the results of proficiency testing, the Supervisor or Manager will determine the extent of the issue, and if necessary open a corrective action to ensure the accuracy and validity of casework. See FSD.15.</td>
</tr>
<tr>
<td>100% technical review of casework</td>
<td>If a significant technical issue arises from 100% technical review of casework, the Supervisor or Manager will determine the extent of the issue and may open a corrective action that may entail: halting casework, retraining of an analyst, or rewriting of procedures. If the issue is not technically significant, the analyst will be given back the case for correction to ensure the correctness of test results.</td>
</tr>
<tr>
<td>Retesting of test items scheduled for destruction—see DRG.40</td>
<td>If a significant technical issue arises from reviewing the results of the retesting of items scheduled for destruction eg. the results of the retesting or reweighing do not correspond to the original analysis, the Supervisor or Manager will determine the extent of the issue and may open a corrective action that may entail: halting casework, retraining of an analyst, or rewriting of procedures.</td>
</tr>
</tbody>
</table>

B. Procedures and Test Methods

1. For procedures in the testing methods of drug analysis, see DRG.34
2. For test data interpretations data, see DRG.34
3. For method, software, and equipment validations and performance checks prior to use in casework see DRG.16 and DRG.32
4. For instruction on the use and operation of equipment see DRG.17, DRG.18, DRG.19, DRG.25, and DRG.28
5. Sampling procedures can be found in DRG.33
6. The comparison of an unknown to a known require the evaluation of the unknowns items to identify characteristics suitable for comparison. Requirements for comparisons can be found in DRG.34

C. Environmental Conditions

1. Environmental factors that may influence results can be found in DRG.17
2. Other items are as follows:
   a. For access to and use of areas affecting laboratory activities, see DRG.02
   b. Prevention of contamination, interference, or adverse influences on laboratory activities, see DRG.09 and DRG.18
   c. Effective Separation between areas with incompatible laboratory activities see DRG.17
   d. Incorporating good housekeeping measures within the laboratory see DRG.17

3. As stated in DRG.17, there are no environmental conditions in the technical requirements for testing drugs that need to be documented or monitored

D. Measurement Assurance

1. General Information:
   a. Measurement Assurance samples will be recorded in a manner where trends are detectable and the data will be reviewed statistically. See Measurement Assurance below for the procedures.
   b. Evaluation of Measurement Assurance data will be performed quarterly
   c. The evaluation should include at least the previous three months of data.
   d. Data should only be inclusive of the lab-created measurand in use.
   e. Minitab software may be used to perform a statistical evaluation; however statistical analysis may be performed using other software as well (eg. Access). The instructions included are for using Minitab.
   f. The measurement assurance should be documented and maintained within the unit.
   g. If there is a change in the measurement process or the measurement instruments, the quarterly measurement assurance will be evaluated to determine if the changes are significant enough to require a full budget reevaluation.

2. Collection of Data:
   a. Every person assigned to the drug section should weigh:
      i. Once per month
      ii. On balances 1, 7, 8, 12 and 13
   b. Do a minimum of (2) weighings for each type of weight
      i. For balances #1, 7, 8, 12 (the small drug balances):
         1. Approximately 1-gram object.
         2. Approximately 1-ounce object
         3. Approximately 300-gram object
      ii. For balance #13 (the large drug balance):
         1. Approximately 1-ounce object
2. Approximately 1-pound object

c. Procedure
   i. Follow the procedure outlined in DRG.18
   ii. Add the entries to the "Drug Section Ongoing Balance Measurement Assurance.mdb" database (see location below).

3. Analysis:
   a. Open the database:
      \L:\LAB\MUIR\1-MUIR ALL\Uncertainty Budget Committee\Measurement Assurance\Drug Section Ongoing Balance Measurement Assurance.mdb
   b. Open the f_Export form
   c. Enter a date range of one year.
   d. Press each button to export each balance type at each weight range.
   e. NOTE: Each time the files are exported, they will re-write over the older export. If the files need to be saved, they should be renamed and moved to another location.
   f. Go to a computer with Minitab and Open Minitab
   g. File | Open Worksheet
   h. Change the filter to “Excel (*.xls, *.xlsx)”
   i. Each .xls file will be exported in the folder:
      \L:\LAB\MUIR\1-MUIR ALL\Uncertainty Budget Committee\Measurement Assurance\DatabaseExports
   j. Open one of the exported .xls files
   k. Stat | Control Charts | Variables Charts for Individuals | Individuals
   l. In the Individuals Chart window click on the variables box:
i. From the available list on the left, select Result.

m. Click the scale button:
   i. On the X Scale radio button, choose Stamp

n. Click in the Stamp Columns box. From the available list on the left, choose DateCheck
o. Click OK

p. On the Individuals Chart window, click on the Labels button
   
i. Enter in an appropriate title for the balance type, weight type, and date range

q. Click OK

r. On the Individuals Chart window, click on the I Chart Options button

s. On the parameters tab, enter the standard deviation given in the chart below. The standard deviation used is obtained from the Process Measurement Assurance data from the Drug Balance Uncertainty Budgets.

<table>
<thead>
<tr>
<th>Balance</th>
<th>Weight</th>
<th>Standard Deviation</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 7, 8, 12</td>
<td>~1 g</td>
<td>0.002709434</td>
</tr>
<tr>
<td>1, 7, 8, 12</td>
<td>~28 g</td>
<td>0.120069575</td>
</tr>
<tr>
<td>1, 7, 8, 12</td>
<td>~300 g</td>
<td>0.120069575</td>
</tr>
<tr>
<td>13</td>
<td>~28 g</td>
<td>0.092819492</td>
</tr>
<tr>
<td>13</td>
<td>~450 g</td>
<td>0.092819492</td>
</tr>
</tbody>
</table>

i. If a new weight measurand is created that does not fall within the levels listed above, there will not be a defined standard deviation until adequate data has been collected and evaluated. The standard deviation parameter can be left blank, minitab will estimate the standard deviation to be used in the control chart from the existing data.

t. Leave the Mean blank
u. On the S Limits tab, enter "1 2 3" in the display control limits blank

v. Click OK

w. On the Individuals Chart window, click OK

x. Right-click on the generated chart. Choose Append to Report

y. Repeat the above Minitab steps for each exported excel file (for each type of balance for each weight range)

z. When all reports are done:
   i. Window | Project Manager
   ii. Right-click on the Report Pad and select Save Report As
   iii. Save the Rich Text File (.rtf) with the date in the file name in the folder:
        L:\LAB\MUIR\1-MUIR ALL\Uncertainty Budget Committee\Measurement Assurance\Archives\
aa. Any discussion of points that fall outside acceptable parameters should be included in the write-up. See Criteria below.

4. **Evaluation:**

   a. The graph is a plot of the measured value of the lab-created weight against the historical standard deviation. The limit lines correspond to $k=1$, $k=2$ and $k=3$ of the historical standard deviation. This evaluation should be performed for:

   i. Balance # 1, 7, 8, 12 for approximately 1 gram
   ii. Balance # 1, 7, 8, 12 for approximately 28 grams
   iii. Balance # 1, 7, 8, 12 for approximately 300 grams
   iv. Balance # 13 for approximately 28 grams
   v. Balance # 13 for approximately 450 grams

5. **Criteria:**

   a. It is expected that most data points will fall within the first 2 limits lines.
   
   b. If points fall beyond the 3rd limit line ($k=3$), then a written explanation should be included with the measurement assurance documentation. The written explanation should address potential sources of variation and actions taken, if necessary.

   i. Possible sources of variation that may be evaluated include:

      1. Typographical errors
      2. Potential issues with the measurand (leaking, etc.)
      3. Recent instrument calibrations, repairs or changes in equipment
      4. Issues with one analyst or a specific balance or measurand
      5. Issues with multiple analysts, multiple balances or multiple measurands
      6. Evaluate if the data point(s) would be outside of the reported uncertainty for that balance
      7. Evaluate if the deviation appears to be a trend. Analyst may need to evaluate longer time period to determine historical trend or persistent issue.
      8. The evaluation will be documented by the analyst preparing the measurement assurance quarterly report with their initials and date of preparation indicating that the criteria was met and/or that a note was made for any potential issues or extenuating circumstances.

   ii. Possible actions to be taken:

      1. Perform a check of the balance with the stainless steel weights. This check should be logged in the Balance Check Log and results of the check included in the write up (eg. Balance passed check)
2. If there is any indication that the balance is not working properly, it should be promptly removed from service.

3. Make a new measurand if the measurand is compromised or determined to be the source of the variation.

4. Notify Supervisor/Manager that the uncertainty budget may need to be evaluated or instrument may need to be removed from service.

E. QA Action-Correction (QAC)

1. See FSD.15 for information about Division Level Corrective Actions.

2. An action taken to correct non-conforming work that has already occurred. The action taken to correct the nonconformity will be based on the severity of the nonconformance. QAC-3 is the least significant, QAC-2 is somewhat significant, and QAC-1 is the most significant non-conformity. Refer to FSD.15 for explanation of the types of QA Actions.
   a. Non-conformity: any aspect of testing or work product that does not conform to laboratory policies, procedures, or the agreed requirements of the customer.

3. QAC-3: an action taken to correct a non-conformity when the significance of the non-conforming work is minimal and is unlikely to reoccur. The correction is readily apparent and can be made quickly. The action will be taken immediately, often by the person observing the non-conformity. The non-conformity or action may or may not be documented. Examples may include:
   a. A mis-shot on the instrument for case sample.
      i. Correction would be to fix any apparent issue and re-analyze.
   b. Typographical error or data entry error that can be fixed before released.
   c. No n-tricosane in blank, correction would be to add n-tricosane and re-shoot

4. QAC-2: action taken to correct a non-conformity when the non-conforming work is of some significance and the investigation demonstrates that the non-conformity did not affect the validity and accuracy of the test result. QAC-2 corrections are actions made to prevent non-conformity in casework from being reported and will be documented. QAC-2 issues will be documented and maintained within the Drug Unit. The correction will be made. All QAC-2's will be brought to the Supervisor's attention. The documentation will be evaluated by a Supervisor/Manager monthly. The Supervisor will evaluate for issues or patterns of problems that may need to be elevated to a QAC-1. Examples of a QAC-2 may include:
   a. Expired and/or non-verified reagents, chemicals or standards used when it was determined the accuracy or quality of the result is not in question
   b. Equipment calibration or checks not occurring as scheduled (GC/MS, FTIR, balances, check weights) when it was determined the accuracy or quality of the result is not in question
   c. Measurement Assurance not occurring as scheduled
   d. Quarterly or Annual drug inventory not occurring as scheduled
   e. Documented procedures not followed when it was determined the accuracy or quality of the result is not in question
f. Persistent problems identified during checking of reports (this would be determined by the Technical Reviewer)

5. **QAC-1**: an action taken to correct a problem or error resulting in erroneous results or conclusions issued for casework, proficiency testing or court testimony, when evidence is compromised or if the problem or error could recur. These issues must be documented immediately by a Supervisor/Manager, who must use the QA Action Procedure. The correction should be made as soon as possible. The action may involve stopping casework, re-training, competency testing, re-writing procedures, etc. Examples of non-conformities that would likely immediately rise to a Quality Action Correction-1:

   a. A technical problem or error results in erroneous results or conclusions being reported in casework.

   b. A technical problem or error results in an unsuccessful proficiency test.

   c. Erroneous court testimony is identified.

   d. Evidence is compromised.

   e. A non-conformity is identified in an audit.

   END OF DOCUMENT
I. Policy: The following is general information about Drug Presumptive Testing (DPT) Training. Both the Laboratory and the District Attorney’s Office are responsible for administration of the DPT program and training law enforcement personnel.

A. Personnel Authorized to Provide Training
   1. Persons authorized to train law enforcement personnel are those that are competent to perform drug analysis and have successfully completed the DPT class.

B. Personnel Authorized to Perform NIK Testing Under DPT Program
   1. Only qualified law enforcement personnel should perform presumptive tests on suspected controlled substances under the DPT program.
   2. Qualified law enforcement personnel shall have successfully completed the approved training course designed for the NIK tests used. The course will consist of classroom lecture and practical experience performing NIK testing.
   3. A person who successfully completes the DPT training course shall be issued certificate of completion

C. Training Course
   1. The instructor shall cover the following:
      a. How to properly utilize NIK kits
      b. The scope of drugs covered under the DPT program
      c. The approved polydrug testing scheme
      d. How to properly document the use of NIK kits on the approved forms
      e. How to properly obtain gross weights
      f. How to properly package and submit evidence
      g. How to properly convey knowledge of controlled substance identification in court
      h. Limitations of NIK testing
   2. Forms used, DPT Manual and Verification Study are made available to all students via ARIES.
D. **Written examination**
   1. The written exam consists of at least 35 questions.
   2. The individual must pass with a score of 80% correct answers.

E. **Practical examination**
   1. The practical exam consists of students being given known substances and performing presumptive testing to obtain the correct result and correct gross weight.
   2. The practical examination is successfully complete when the student demonstrates to the instructor correct hands-on use of the NIK kit.

F. **Records**
   1. The laboratory will maintain a record of all trained law enforcement personnel.

G. **DPT Program Manual**
   1. The responsibilities and obligations of all parties can be found in the DPT Manual available on ARIES.
   2. The purpose of the DPT manual is to outline the procedural and reporting requirements for conducting the Presumptive Test during the investigation of narcotics related incidents for the common drugs of abuse in Contra Costa County.
   3. The DPT manual is intended to be a supplement to the 8 hour Course taught by the Contra Costa County Crime Lab and District Attorney’s Office.
I. Policy: The following is the procedure for adding electronic images. These Instructions are intended to be a guide for usage and slight variations may be made for file names, names of folders, etc.

A. Instructions for adding single images to the LIMS

1. Printouts from instrument software can be converted to electronic images for use in case notes by printing through an application such as JusticeTrax Imaging.

   a. When printing from an application, the printer should be set to JusticeTrax Imaging and Printer Properties set for the desired image.

   b. .TIF files:

      i. .TIF file format must be used if Imaging or Batch Imaging will be used to send the file to LIMS.

      ii. The following JusticeTrax Imaging printer settings are adequate for imaging the majority of text documents, however settings may be changed to meet the needs of the user and image (ie. colors, pictures, storage locations).

         1. Device Settings tab - select "Portrait" and "Low Resolution 200 x 200 DPI"

         2. File Formats tab - select "TIFF Packed (*.tif)", "1 bit"

         3. File Formats tab - each page saved as separate file ("Create Multipage Image" should be unchecked or "Save each page as a separate file" should be checked)

         4. Filename Generation tab - "C:\Temp". Temp folders on most instrument computers will be accessible from LIMS computers.

         5. Start Application tab - uncheck the "Disable Messaging Interface"

         6. File format is dictated by LIMS requirements, settings such as resolution and color depth should be used to minimize file sizes.

   c. .JPG files:
i. JPG files can also be used if the images are manually inserted into LIMS. JPG files cannot be used with Indexer or Batch Indexer. In general, JPG files are smaller in size than .TIF files.

ii. The JusticeTrax Imaging printer settings are similar to the .TIF settings with the following differences:

1. File Format tab - select "JPEG (*.jpg)"
2. File Format tab - select "24 bits"

2. In general, images from the instruments are added into JusticeTrax using a program called JusticeTrax Indexer.
   a. Indexer or Batch Indexer can only use .TIF files.
   b. The indexer will automatically add annotations with the username on each image based on the person logged in. Font size and position can be adjusted to ensure it does not overwrite important information or detail
      i. If the person performing the data analysis is different from the person closing the case, the analyst's initials, or secure electronic equivalent, must appear on the images. In Drug Analysis, the person performing the analysis is usually the person generating the report.
         1. The person performing the data analysis must be logged into the indexer.
         2. The annotation can be anywhere on the page, but the font size should be large enough to be visible.
   c. Each page must be a separate image.
   d. If indexer is open when printing from JusticeTrax Imaging, the image may automatically appear in the application.
   e. Alternatively, select File > Load File from Disk and navigate to a saved image.
   f. Type the laboratory number into the Locate field to search for requests associated with that laboratory number.
   g. Select the appropriate request.
   h. Enter the image name including prefix and number into the Enter Image Name field. See "Image name prefix" below.
   i. Hit the Save button.
   j. Analysis images in the notes should be ordered by item, this may require renaming images in LIMS.
      i. Renaming an image will not alter the secure username attached to the image.
      ii. Anyone can add images, however once in LIMS images may be renamed or edited by either the person who entered the image or the person assigned to the case.
3. Images that do not require initials can be added to a case through the LIMS Imaging module.
   a. In Drug Analysis, the person performing the analysis is the person completing the report. Secure initials are not required on the image (every notes page will be initialed when complete).
   b. Images must have been saved in an appropriate format and accessible from the computer being used.
   c. The case is accessed in LIMS.
   d. The LIMS-Imaging module can be accessed from the image button. This can be seen in case view or edit findings.
   e. Select the desired request and add images (Image > Insert New Image).
   f. In the dialog box that opens, navigate to the saved images.
   g. Select the image to be added. If the Image >"Allow multiple images on Add" is activated, multiple images can be added at once.
   h. An image name can be entered, LIMS automatically adds the date/time and iterates the images.
   i. Rename the images as needed.

4. Adding multiple images to the case file
   a. JusticeTrax Batch Imaging can upload multiple images to LIMS using a Directory (text files within a folder for each image) or a Batch File (a single text file that lists all images).
   b. See TOX.10 and BA.43 for further information.

5. Image name prefix
   a. Specific prefixes are used to order images when displayed in crystal reports; within each prefix, images are ordered in alphanumeric order (eg DATA01 before DATA02 before DATA03).
   b. The prefix "REP" will make images appear in the report instead of the notes.
   c. In the notes, images will appear in the following order: "EVID", "IMG", "DATA", ENV, (any other name).
      i. The prefix "EVID" is used to create smaller thumbnail sized images directly after the body of the report.
      ii. The prefix "IMG" is used for request notes, emails, or other information that is to appear at the beginning of the nearly full-sized images.
      iii. The prefix "DATA" is used for instrumental data images. "DATA" images will appear nearly full-page size.
      iv. The prefix "ENV" is used for scans of the envelope or request form. "ENV" images will appear nearly full-page size.

B. Instructions for photographs in LIMS
1. Photographs of evidence may be added to LIMS for verification of discrepancies or to aid in the description of evidence. These photographs are not to be used as evidence. If photographs are used as evidence see FSD.42.01.
   a. File sizes should be kept to around 1 MB or less. Acceptable file types are TIF packed (8-bit or less) or JPEG.
   b. The image size must fit on a single page of the crystal report. If the image spans multiple pages, adjust the settings on the camera or crop the picture.
   c. A ruler or reference scale can be added to give perspective on size. It is not critical that the scale be in sharp focus or calibrated.
   d. Due to color corrections/variability of cameras, monitors and printers, colors in the picture may appear differently than as described by the analyst.
   e. The intended purpose is not to provide high resolution pictures or fine detail. Resolution and detail must only be adequate for the intended purpose.
      i. For example, if the purpose is verification of the number of pills submitted, there must be enough resolution for the reviewer to be able to count the number of pills. Markings on the pill do not need to be visible.

2. An analyst may use any type of device (USB camera, iPad, digital camera, etc) that can produce pictures of the appropriate size and resolution. Instructions are provided below for the use of the Ipevo Point 2 View USB camera and Presenter software.
   a. The camera connects to the computer via a USB cable and should be set in the stand at an appropriate height to obtain the desired view of the evidence. The camera may also be handheld.
   b. Open the Presenter software. This provides a live view of the camera.
   c. The default location to save pictures can be set to a specific location (ie C:temp) under Settings - General - File Save Location.
   d. The resolution of the image should be set to 1024x768 and rotated into portrait view.
   e. The camera can automatically determine the appropriate exposure, or it can be manually adjusted.
   f. The camera has auto focus and can be set to continuous or single on the camera. Focus can also be manually adjusted from the software.
      i. The Autofocus switch is on the camera. If set to continuous it will automatically adjust when the image changes.
      ii. If set to Single Focus, the camera may not automatically adjust focus when the view changes. The Focus button on the camera or in the software will reset the focus of the camera.
      iii. Manual focus can be used if autofocus does not achieve the desired result, or to focus on a specific object in the picture.
   g. Moving the camera closer to the object will zoom in on the item. The software also allows for a digital zoom.
h. Once the desired image is achieved, the picture is taken by using the snapshot button in the software or on the camera. The picture is saved to the specified location.

i. The picture can be added to LIMS by the method described above. If the picture is of a single item, the item number can be added to the image name for identification.

j. If the prefix "EVID" is used, the image will print in thumbnail style with three pictures across the page.

k. If the prefix "DATA' is used it will print as a full page with the instrumental data.

l. The camera can also function as a scanner.
   i. Presenter must be in TWAIN mode.

   1. 

   ii. Open the LIMS Imaging module. Select the "Scan New Image" button.

   iii. Select the Ipevo Presenter Virtual Scanner as the source.

   iv. The picture will be added to LIMS. (It will not be saved to the designated location on the computer as the snapshot will)

3. The image may be altered within the LIMS Imaging Module.
   a. If the picture was taken in landscape mode, rotate to portrait (landscape pictures may not view correctly in the Crystal report).

   b. If the image contains multiple items, annotations can be added to clearly mark each item.

   c. Once all changes are made, use Image - Burn Annotation on Current Page to save the changes.

   END OF DOCUMENT
I. Policy: Below is general information regarding Amphetamine Analogs.

- **MDA**
- **MDMA** (3,4-Methylenedioxymethamphetamine)

A. This volume does not pretend to be all inclusive. As this sentence is being read there may be a new analog being devised. An excellent source of information concerning Amphetamine analogs as well as other analogs is Microgram published by the DEA. They normally provide such information as color tests, crystal tests, GC data, UV data, and IR data. Hundreds of compounds can be produced by making slight modifications to the phenethylamine molecule. Some of these analogues are pharmacologically active and differ from one another in potency, speed of onset, duration of action, and capacity to modify mood, with or without producing overt hallucinations. The drugs are usually taken orally, sometimes snorted, and rarely injected. Because they are produced in clandestine laboratories, they are seldom pure and the amount in a capsule or tablet is likely to vary considerably.

B. **3,4-Methylenedioxymethamphetamine** (MDMA, Ecstasy) was first synthesized in 1912 but remained in relative obscurity for many years. In the 1980s, MDMA gained popularity as a drug of abuse resulting in its final placement in Schedule I of the federal CSA. In California, MDMA is not scheduled. It is an analog of MDA, which is schedule I in California.

1. MDMA produces both amphetamine-like stimulation and mild mescaline-like hallucinations. It is touted as a "feel good" drug with an undeserved reputation of safety. MDMA produces euphoria, increased energy, increased sensual arousal, and enhanced tactile sensations. However, it also produces nerve cell damage that can result in psychiatric disturbances and long-term cognitive impairments. The user will often experience increased muscle tension, tremors, blurred vision, and hyperthermia. The increased body temperature can result in organ failure and death.

2. MDMA is usually distributed in tablet form and taken orally at doses ranging from 50 to 200 mg. Individual tablets are often imprinted with graphic designs or commercial logos, and typically contain 80-100 mg of MDMA. After oral administration, effects are felt within 30 to 45 minutes, peak at 60 to 90 minutes, and last for 4 to 6 hours. Analysis of seized MDMA tablets indicates that about 80 percent of all samples actually contain MDMA. About 10 percent of the MDMA-positive samples also contain MDA (3,4-methylenedioxyamphetamine) and MDEA (3,4-methylenedioxyethylamphetamine), while another 10 percent contain amphetamine, methamphetamine, or both. Fraudulent MDMA tablets frequently contain combinations of ephedrine, dextromethorphan, and caffeine or newer piperazine compounds.

C. A number of "New Hallucinogens" phenethylamine, tryptamine, cathinone, piperazine and other analogues have been encountered on the illicit market.

1. While these drugs are not specifically listed under the CSA, individuals trafficking in these substances can be prosecuted under the **Analogue Statute 11401 of the CSA**. The ever-increasing number of these types of hallucinogens being encountered by law enforcement is a testament to the efforts of individuals to engage in profitable drug enterprises while trying to avoid criminal prosecution.
1. From a chemical point of view all amphetamine-type stimulants are related to the Beta-phenethylamine molecule (2-PEA). This molecule is the basic element of the body neurotransmitters (such as dopamine and adrenaline) that convey the neuronal information of the central and peripheral nervous system.

2. The relatively simple structure of 2-PEA can be designed in many ways, so that it is very difficult to calculate the exact number of all possible derivatives with similar pharmacological effects.

3. Amphetamine itself might be called the prototype ('mother') psychostimulant. It was first synthesised in 1887 but was not used for medical purposes until the early 1930s, when it was found that it increased blood pressure, stimulated the central nervous system, cured bronchodilatation (asthma) and was useful in treating an epileptic seizure disorder. The abuse of this drug started at the same time.

4. The most common amphetamine derivatives currently known from the illicit drug market can be classified in the following three categories:
   a. **non-ring substituted amphetamine derivatives** such as Amphetamine, Methamphetamine, Ethylamphetamine, Dimethylamphetamine, N-Hydroxyamphetamine, N-Hydroxymethamphetamine, Phenethylamine (PEA), (+) Cathine, (-) Cathinone, Methcathinone, Amfepramone, and Amphetaminil;
   b. **methylenedioxy-amphetamines** such as MDA, MDMA, MDE, MDDMA, N-Hydroxy-MDA, N-Hydroxy-MDMA, MBDB, BDB, MMDA, FLEA, 6(2)-Cl-MDMA;
   c. **ring and side-chain substituted amphetamines** such as 2 C-B, 2 C-T, 2 C-T2, 2 C-T7, 2 C-C, 2 C-I, TMA-2, DOM, DOB, DOC, DOI, DOET, Diethoxybromoamphetamine (all 2,4,5-ringsubstituted orientation) and PMA (4-MA), DMA (2,5-DMA), TMA, PMMA, 4-MTA, AL and MAL (all other ringsubstituted orientation).
      i. 2C-T7 2,5, dimethoxy-4-propylthiophenethylamine
      ii. 2CB 4-bromo-2,5, dimethoxyphenethylamine
      iii. 2C-T-2 2,5-Dimethoxy-4-ethylthiophenethylamine
      iv. 2C-I 4-Iodo-2,5-dimethoxyphenethylamine
      v. 2C-T-21 2,5-Dimethoxy-4(2-fluoroethylthio)phenethylamine
      vi. 2C-E 2,5-Dimethoxy-4-ethylphenethylamine
      vii. 2C-C 2,5-Dimethoxy-4-chlorophenethylamine
      viii. DOB 4-bromo-2,5, dimethoxy-phenyl-2-aminopropane
      ix. Nexus bromo-2,5, dimethoxyphenethylamine HCl

5. These are only examples of possible derivatives, for further information you have to look at the established literature, see the table below for a list of some substituted amphetamines.

E. The following **tryptamines** may be encountered in illicit pills (see tryptamine section for analysis):

1. **AMT**, alpha methyl tryptamine
2. **DPT**, N,N-Dipropyltryptamine
3. **DIPT**, N,N-Diisopropyltryptamine
4. **5-MeO-DIPT**, Foxy, Roxy, n,n-diisopropyl-5-methoxytryptamine
5. **5-MeO-DET**, 5-Methoxy-N,N-diethyltryptamine
6. **5-MeO-DET**, 5-Methoxy-N,N-dimethyltryptamine
7. **5-MeO-AMT**, 5-Methoxy-alpha-methyltryptamine
8. **4-MeO-MIPT**, 4-Methoxy-N-methyl-N-isopropyltryptamine
9. **5-MeO-MIPT**, 5-Methoxy-N-methyl-N-isopropyltryptamine
10. **5-MeO-MIPT**, N-Methyl-N-isopropyltryptamine
11. **4-OH-DIPT**, 4-Hydroxy-N,N-diisopropyltryptamine

F. The following **piperazines** may be encountered in illicit pills:

1. **BZP**, n-benzylpiperazine
2. **2-MeOPP**, 2-methoxyphenylpiperazine
3. **2-MePP**, 2-methylphenylpiperazine
4. **3-CIPP** (or m-CPP), 3-chlorophenylpiperazine
5. **TFMPP**, 1-3 trifluoromethylpiperazine

G. Peyote is a small, spineless cactus, *Lophophora williamsii*, whose principal active ingredient is the hallucinogen mescaline (3, 4, 5-trimethoxyphenethylamine). From earliest recorded time, peyote has been used by natives in northern Mexico and the southwestern United States as a part of their religious rites.

1. The top of the cactus above ground—also referred to as the crown—consists of disc-shaped buttons that are cut from the roots and dried. These buttons are generally chewed or soaked in water to produce an intoxicating liquid. The hallucinogenic dose of mescaline is about 0.3 to 0.5 grams and lasts about 12 hours. While peyote produced rich visual hallucinations that were important to the native American peyote users, the full spectrum of effects served as a chemically induced model of mental illness. Mescaline can be extracted from peyote or produced synthetically. Both peyote and mescaline are listed in the CSA as Schedule I hallucinogens.
2. Many chemical variations of mescaline and amphetamine have been synthesized for their "feel good" effects. 4-Methyl-2,5-dimethoxyamphetamine (DOM) was introduced into the San Francisco drug scene in the late 1960s and was nicknamed STP; an acronym for "Serenity, Tranquility, and Peace." Other illicitly produced analogues include 4-bromo-2,5-dimethoxyamphetamine (DOB) and 4-bromo-2,5-dimethoxyphenethylamine (2C-B or Nexus). In 2000, para-methoxyamphetamine (PMA,) and para-methoxymethamphetamine (PMMA) were identified in tablets sold as Ecstasy. PMA, which first appeared on the illicit market briefly in the early 1970s, is associated with a number of deaths in both the United States and Europe.

   a. The following tables include information on how various substances will be reported by the Laboratory. See **DRG 38 Section I.** for information on entering special schedules in LIMS.

(1) Hallucinogens: An Update, National Institute on Drug Abuse Research Monograph Series. NIH Publication No. 94-38
DOx is a term used to refer to a chemical class of substituted amphetamine derivatives featuring methoxy groups at 5-positions of the phenyl ring, and a substituent such as alkyl or halogen at the 4-position of the phenyl ring.

Substituted Cathinones & Cathinone Type Substances

11375.5 States:

2-amino-1-phenyl-1-propanone (cathinone) or variation in any of the following ways:

(A) By substitution in the phenyl ring to any extent with alkyl, alkoxy, alklyenedioxy, haloalkyl, or halide substituents, whether or not further substituted in the phenyl ring by one or more other univalent substituents.

(B) By substitution at the 3-position with an alkyl substituent.

(C) By substitution at the nitrogen atom with alkyl, dialkyl, or benzyl groups, or by inclusion of the nitrogen atom in a cyclic structure.

II. Analysis

A. Presumptive Tests

1. Four color tests are extremely useful for screening Amphetamine analogs. These tests are Marquis, Mecke, Froehde, and Rothera's. Rothera's is used for screening secondary amines. Marquis reagent produced a variety of colors with the analogs tested. Mecke and Froehde produced green colors in general, though there are exceptions. Of the seven analogs tested, only two, MDMA and n,n-DMA, produced positive blue reactions with Rothera's. The orange Marquis and blue Rothera's produced by n,n-DMA are the same reactions produced by Methamphetamine. Liebermann is useful for detecting cathinone analogs, many will give a bright yellow color. A supplemental color test, Modified Cobalt Thiocyanate (COSCN), while not necessary for the identification of the type of Phenethylamine, should be performed in conjunction with the other tests.

2. For reagent recipes, see DRG.13 - Reagent Preparation.
   a. Marquis Procedure: Add a toothpick full of questioned material to one drop of the test reagent. Note the color formed.
   b. Mecke's Test: Procedure: Add a toothpick full of questioned material to one drop of the test reagent. Note the color formed.
   c. Froehde's Test: Procedure: Add a toothpick full of questioned material to one drop of the test reagent. Note the color formed.
   d. Liebermann Test: Procedure: Add a toothpick full of questioned material to one drop of the test reagent. Note the color formed.
   e. Secondary Amine Test (Rothera) Procedure: Add a toothpick full of questioned material to one drop of solution a. Add a drop of solution b. Next add one drop of solution c. A bright blue color indicates a secondary amine. Note the color formed

B. Confirmatory Analysis

1. The GC/MS can be used for confirmation. The recommended procedure for running a sample is as follows:
   a. Solvent Extraction
      i. Take a small quantity of the powder or liquid to be analyzed.
      ii. Basify the sample (for phenethylamine analogs)
      iii. Extract out with Petroleum Ether, CHCl₃ or suitable solvent based on the analyte characteristics and solubility information.
      iv. There may be a "salting" effect of Phenethylamines when extracted in methanol resulting in unacceptable chromatography (significant peak tailing), if this occurs Petroleum Ether should be used.
      v. It should be noted that methanol is not a suitable solvent if it is suspected that water is present in the sample. If it is suspected that water is present in the sample then a basic chloroform extract should be used.
      vi. Add a suitable internal standard, like n-Tricosane.
   b. Analysis
      i. The commonly used methods on the GC/MS are dea.m, meth.m, and GEN.m. Following a positive screening color test indicating a possible class of drugs, dea.m or meth.m can be used. GEN.m is used for unknowns.
      ii. Inject on the GC/MS. Use the smallest amount of sample and injection volume to get good spectra for positive ID.
      iii. Always inject a blank solvent containing the internal standard like n-Tricosane, before injecting the unknown sample onto the GC/MS.
      iv. If the sample has a weak response, concentrate the sample or inject a larger volume. Molecular ion is essential for a positive ID.
      v. Due to similarities in the mass spectra and retention time, it may not be possible to distinguish some positional isomers.
      vi. The GC/MS data is in PowerDMS.

2. Infrared Spectroscopy (FTIR) is a means of positively identifying a sample. The major drawback is that the sample must be almost completely free of any diluents or must be readily cleaned-up. This clean-up can take the form of a solvent extraction.
   a. It may be possible to distinguish isomers using IR that could not be differentiated by GC/MS.

I. Policy: Study Topics for the analyst to review with the Trainer.
   A. The trainer may review the study topics with the analyst in a written or oral format. The trainer should document that the review has occurred.
      1. Is 3,4-methylenedioxymethamphetamine listed as a controlled substance on the California Health and Safety code. If yes, locate it. If no, how is it a controlled substance?
      2. What is the Controlled substance Analog law? What is its Offense Code listed under the CSA? What are the two main requirements for a drug to be defined as an analog? Do both the requirements need to be met? Explain
      3. What color tests should one use as presumptive tests for a suspected MDMA pill? What color reaction should one expect for each?
      4. What is the chemical name for STP or DOM? What is the structural similarity between STP and MDA?

### I. Policy:

Below is general information regarding Barbiturates.

#### A. Barbituric acid ($R_1=R_2=H$)

- Amobarbital ($R_1$=ethyl, $R_2$=isoamyl, $R_3=H$)
- Secobarbital ($R_1$=allyl, $R_2$=methylbutyl, $R_3=H$)
- Pentobarbital ($R_1$=ethyl, $R_2$=methylbutyl, $R_3=H$)
- Barbital ($R_1=R_2$=ethyl, $R_3=H$)
- Methohexital ($R_1$=allyl, $R_2$=isohexyne, $R_3=phenyl$)
- Mephobarbital ($R_1$=ethyl, $R_2$=phenyl, $R_3=methyl$)
- Phenobarbital ($R_1$=ethyl, $R_2$=phenyl, $R_3=H$)

#### B. Barbiturates were commonly prescribed sedatives before physicians began to replace them with Benzodiazepines.

#### C. Most, if not all, Barbiturates may be tentatively identified by their appearance. To confirm the identity of the pills, substances suspected of being Barbiturates generally are screened using a battery of color tests then confirmed using chromatographic techniques.

#### D. Barbiturates were very popular in the first half of the 20th century. In moderate amounts, these drugs produce a state of intoxication that is remarkably similar to alcohol intoxication. Symptoms include slurred speech, loss of motor coordination, and impaired judgment. Depending on the dose, frequency, and duration of use, one can rapidly develop tolerance, and physical and psychological dependence on barbiturates. With the development of tolerance, the margin of safety between the effective dose and the lethal dose becomes very narrow. Although many individuals have taken barbiturates
therapeutically without harm, concern about the addiction potential of barbiturates and the ever-increasing number of fatalities associated with them led to the development of alternative medications. Today, less than 10 percent of all depressant prescriptions in the United States are for barbiturates.

E. Barbiturates were first introduced for medical use in the early 1900s. More than 2,500 barbiturates have been synthesized, and at the height of their popularity, about 50 were marketed for human use. Today, about a dozen are in medical use. Barbiturates produce a wide spectrum of central nervous system depression, from mild sedation to coma, and have been used as sedatives, hypnotics, anesthetics, and anticonvulsants. The primary differences among many of these products are how fast they produce an effect and how long those effects last. Barbiturates are classified as ultrashort, short, intermediate, and long-acting.

F. The ultrashort-acting barbiturates produce anesthesia within about one minute after intravenous administration. Those in current medical use are the Schedule IV drug methohexital (Brevital™), and the Schedule III drugs thiamyl (Surital™) and thiopental (Pentothal™). Barbiturate abusers prefer the Schedule II short-acting and intermediate-acting barbiturates that include amobarbital (Amytal™), pentobarbital (Nembutal™), secobarbital (Seconal™), and Tuinal (an amobarbital/secobarbital combination product). Other short and intermediate-acting barbiturates are in Schedule III and include butalbital (Fiorinal™), butabarbital (Butisol™), talbutal (Lotusate™), and aprobarbital (Alurate™). After oral administration, the onset of action is from 15 to 40 minutes, and the effects last up to six hours. These drugs are primarily used for insomnia and preoperative sedation. Veterinarians use pentobarbital for anesthesia and euthanasia.

G. Long-acting barbiturates include phenobarbital (Luminal™) and mephobarbital (Mebaral™), both of which are in Schedule IV. Effects of these drugs are realized in about one hour and last for about 12 hours, and are used primarily for daytime sedation and the treatment of seizure disorders.

H. This is an outline of the procedures presently in use at this laboratory. The tests and their implications are discussed. The specific instructions on how to perform the tests are provided in the individual sections of this manual.

II. Policy: Below is information regarding screening Barbiturates.

A. Markings and Appearance

1. The first screening test is a physical examination of the material in question. A tablet or capsule can usually be tentatively identified using the Physician's Desk Reference, one of the many commercial pharmaceutical catalogs available, or by phoning the manufacturer or Poison Control. If the material is submitted as a powdered or ground tablet, then it should be analyzed using color tests and instrumental analysis.

B. Color Tests
1. Two color tests are useful for screening Barbiturates; Dille-Koppanyi and Zwiker's.

2. Dille-Koppanyi will produce a purple color with all Barbiturates, Gluthethimide and Hydantoin. The Dille-Koppanyi test will separate the Barbiturates into two categories. Most of the Barbiturates will produce a color with the first step of the color test and some upon the addition of the second reagent.

3. Hydantoin, Gluthethimide, and Thiobarbiturate can be distinguished from Barbiturates using the Zwiker's test.

4. Zwiker's test consists of two stages; the first being a color reaction and the second being an organic extraction. After the extraction step, Barbiturates will produce a purple organic layer, Thiobarbiturate a green layer and Hydantoin produces no extractable color.

   a. Dille-Koppanyi:
      i. Reagents:
         1. 1% cobaltous acetate in methanol
         2. 5% isopropylamine in methanol
      ii. Procedure: Add a toothpick full of questioned material to one drop of solution a. Most Barbiturates form a purple color at this point. Next add one drop of solution b. The formation or persistence of a purple color indicates the presence of a Barbiturate, Gluthethimide or Hydantoin.
      iii. Indicate the color formed (for step 1 and 2)

   b. Zwiker's:
      i. Reagents:
         1. 0.5% CuSO$_4$ in H$_2$O
         2. 5% pyridine in Chloroform (CHCl$_3$)
      ii. Procedure: Add a toothpick full of questioned material to three to four drops of solution a in a test tube or shell vial. Add two to three drops of solution b and shake gently.
      iii. Indicate the color of the organic phase (lower layer).

III.  Policy: Below is information regarding confirmation of Barbiturates.

A. The GC/MS can be used to confirm Barbiturates. The recommended procedure for running a sample is as follows:

1. Solvent Extraction
   a. Take a small quantity of the powder or liquid to be analyzed.
   b. Extract out with methanol or suitable solvent based on the analyte characteristics and solubility information.
   c. Add a suitable internal standard, n-Tricosane is commonly used as an internal standard

2. Analysis
   a. The commonly used method on the GC/MS is GEN.m and dea.m
   b. As a routine, 1 µl is injected on the GC/MS
   c. Always inject a blank solvent containing the internal standard before injecting the unknown sample onto the GC/MS
   d. On occasion the samples may be weak. Such samples need to be concentrated to be identified. More of the sample may need to be extracted, or a larger volume of sample may need to be injected on the GC/MS
e. The GC/MS data is attached.

3. GC/MS Data of Retention Time/Relative Retention Time

a. Note: Retention times may vary based on the concentration of the compound injected on the GC/MS. Generally, highly concentrated samples have slightly increased Retention Time

IV. Policy: Study Topics for the analyst to review with the Trainer.

A. The trainer may review the study topics with the analyst in a written or oral format. The trainer should document that the review has occurred.

1. List the two major mass spectral ions that are common in all three compounds: amobarbital, barbital and pentobarbital.

2. What is the color test for barbiturates? Give the expected positive color reaction.

3. What chemical compound are barbiturates derived from?

4. List the short acting, intermediate acting and long acting barbiturates? Define their schedules as listed in CSA.

I. Policy: Below is general information regarding Benzodiazepines.

A. **DIAZEPAM**

B. **CHLORDIAZEPoxide**

C. The most commonly prescribed tranquilizers are Benzodiazepines. This class includes but is not limited to, Diazepam (Valium) and Chlordiazepoxide (Librium). Benzodiazepines are of forensic interest because they are commonly abused and are controlled under the California Health and Safety Code.

D. Benzodiazepines were first marketed in the 1960s. Touted as much safer depressants with far less addiction potential than barbiturates, today these drugs account for about one out of every five prescriptions for controlled substances. Although benzodiazepines produce significantly less respiratory depression than barbiturates, it is now recognized that benzodiazepines share many of the undesirable side effects of the barbiturates. A number of toxic central nervous system effects are seen with chronic high-dose benzodiazepine therapy, including headaches, irritability, confusion, memory impairment, and depression. The risk of developing over-sedation, dizziness, and confusion increases substantially with higher doses of benzodiazepines. Prolonged use can lead to physical dependence even at doses recommended for medical treatment. Unlike barbiturates, large doses of
benzodiazepines are rarely fatal unless combined with other drugs or alcohol. Although primary abuse of benzodiazepines is well documented, abuse of these drugs usually occurs as part of a pattern of multiple drug abuse. For example, heroin or cocaine abusers will use benzodiazepines and other depressants to augment their "high" or alter the side effects associated with over-stimulation or narcotic withdrawal.

E. The benzodiazepine family of depressants is used therapeutically to produce sedation, induce sleep, relieve anxiety and muscle spasms, and to prevent seizures. In general, benzodiazepines act as hypnotics in high doses, anxiolytics in moderate doses, and sedatives in low doses. Of the drugs marketed in the United States that affect central nervous system function, benzodiazepines are among the most widely prescribed medications. Fifteen members of this group are presently marketed in the United States, and about 20 additional benzodiazepines are marketed in other countries. Benzodiazepines are controlled in Schedule IV of the CSA.

1. Short-acting benzodiazepines are generally used for patients with sleep-onset insomnia (difficulty falling asleep) without daytime anxiety. Shorter-acting benzodiazepines used to manage insomnia include estazolam (ProSom™), flurazepam (Dalmane™), temazepam (Restoril™), and triazolam (Halcion™). midazolam (Versed™), a short-acting benzodiazepine, is utilized for sedation, or treating anxiety and amnesia in critical care settings and prior to anesthesia. It is available in the United States as an injectable preparation and as a syrup (primarily for pediatric patients).

2. Benzodiazepines with a longer duration of action are utilized to treat insomnia in patients with daytime anxiety. These benzodiazepines include alprazolam (Xanax™), chlordiazepoxide (Librium™), clorazepate (Tranxene™), diazepam (Valium™), halazepam (Paxipam™), lorzepam (Ativan™), oxazepam (Serax™), prazepam (Centrax™), and quazepam (Doral™). Clonazepam (Klonopin™), diazepam, and clorazepate are also used as anticonvulsants.

F. Benzodiazepines are classified in the CSA as depressants. Repeated use of large doses or, in some cases, daily use of therapeutic doses of benzodiazepines is associated with amnesia, hostility, irritability, and vivid or disturbing dreams, as well as tolerance and physical dependence. The withdrawal syndrome is similar to that of alcohol and may require hospitalization. Abrupt cessation of benzodiazepines is not recommended and tapering-down the dose eliminates many of the unpleasant symptoms.

G. Given the millions of prescriptions written for benzodiazepines, relatively few individuals increase their dose on their own initiative or engage in drug-seeking behavior. Those individuals who do abuse benzodiazepines often maintain their drug supply by getting prescriptions from several doctors, forging prescriptions, or buying diverted pharmaceutical products on the illicit market. Abuse is frequently associated with adolescents and young adults who take benzodiazepines to obtain a "high." This intoxicated state results in reduced inhibition and impaired judgment. Concurrent use of alcohol or other depressant with benzodiazepines can be life threatening. Abuse of benzodiazepines is particularly high among heroin and cocaine abusers. A large percentage of people entering treatment for narcotic or cocaine addiction also report abusing benzodiazepines. Alprazolam and diazepam are the two most frequently encountered benzodiazepines on the illicit market.

II. Analysis

A. Presumptive Tests

1. The first screening test is a physical examination of the submitted material. If the material is in a tablet or capsule form, the physical appearance is usually a very
strong indication of the compound present. Due to the potential of counterfeit pills, particularly alprazolam, pills should analyzed for confirmation. If the material is submitted as a powder or ground tablet, the sample should be analyzed by color tests and instrumental analysis.

2. The modified COSCN helps to differentiate among the various types of benzodiazepines. Those that give a color reaction will produce a blue or green color. Due to the small amounts in pharmaceutical preparations, it may not be possible to see any color reactions from pills.

3. For reagent recipes, see DRG.13 - Reagent Preparation. Note the color formed.

B. Confirmatory Analysis

1. The GC/MS can be used to confirm Benzodiazepines. The recommended procedure for running a sample is as follows:

   a. Solvent Extraction
      i. Take a small quantity of the powder or liquid to be analyzed.
      ii. Extract out with methanol or suitable solvent based on the analyte characteristics and solubility information.
      iii. It should be noted that methanol is not a suitable solvent if it is suspected that water is present in the sample. If it is suspected that water is present in the sample then an acid basic chloroform extract should be used.
      iv. Add a suitable internal standard, n-Tricosane is commonly used as an internal standard

   b. Analysis
      i. The commonly used methods on the GC/MS are GEN.m, dea.m, and opi.m. (it should be noted that the opi.m method should be used following a positive screening test; use GEN.m for an unknown).
      ii. As a routine, 1 µl is injected on the GC/MS
      iii. Always inject a blank solvent containing the internal standard before injecting the unknown sample onto the GC/MS (n-Tricosane is commonly used).
      iv. On occasion the samples may be weak such that the molecular ion of the drug is not detected. Such samples need to be concentrated to be identified. More of the sample may need to be extracted, or a larger volume of sample may need to be injected on the GC/MS

   v. The GC/MS data is in PowerDMS.

</table>
Nitrazepam | 13.61 | 1.309  
Chlordiazepoxide | 14.25 | 1.372  
Clonazepam | 14.45 | 1.391  

Note: Retention times may vary based on the concentration of the compound injected on the GC/MS. Generally, highly concentrated samples have slightly increased Retention Time.

f. Chlordiazepoxide is not thermally stable. The temperatures used in routine GC/MS analysis cause the formation of a breakdown product that may have a greater response than chlordiazepoxide. Confirmation may require larger amounts of sample to compensate for the breakdown of the compound during analysis.

2. Infrared Spectroscopy (FTIR) is a means of positively identifying a sample. The major drawback is that the sample must be almost completely free of any diluents or must be readily cleaned-up. This clean-up can take the form of a solvent extraction.

III. Policy: Study Topics for the analyst to review with the Trainer.

A. The trainer may review the study topics with the analyst in a written or oral format. The trainer should document that the review has occurred.

1. List the common resources that may aide in identifying benzodiazepine pills by appearance and markings.

2. Is identification by appearance and markings considered a presumptive test or confirmatory test?

3. What are the screening color tests for benzodiazepines? What is the limitation of a color test on pills vs. a know benzodiazepine standard?

4. Draw or define the general structure of benzodiazepines.

5. List the common cause(s), why benzodiazepines replaced the Barbiturates prescriptions?

I. Policy: Below is general information regarding Caines.

A. **Cocaine** (Methyl Benzylecgonine)
   C_{17}H_{21}NO_{4}
   MW = 303.35

   1. Cocaine and Ecgonine are the only scheduled caines. Cocaine is a common controlled substance encountered in this laboratory. Ecgonine is rarely encountered alone, but may be seen in cocaine samples. Cocaine may be in a salt or a base form.

B. **Enhancements:**

   1. PC 1203.073b1: Possession for sale of a substance containing 28.5 grams or more of cocaine or 57 grams or more of a substance containing cocaine.
   2. PC 1203.073b5: Possession for sale of a substance containing 14.25 grams or more of cocaine base or 57 grams or more of a substance containing at least 5 grams of cocaine base.
   3. H&S 11370.4a1-4ab: Penalty enhancements for substances containing cocaine where the substance exceeds 1, 4, 10, 20, 40 & 80 kg by weight.

C. The "Caines" include alkaloids produced by the coca plant and a variety of local anesthetics. Cocaine, the most potent stimulant of natural origin, is extracted from the leaves of the coca plant (*Erythroxylum coca*), which is indigenous to the Andean highlands of South America. Natives in this region chew or brew coca leaves into a tea for refreshment and to relieve fatigue, similar to the customs of chewing tobacco and drinking tea or coffee. Pure cocaine was first isolated in the 1880s and used as a local anesthetic in eye surgery. It was particularly useful in surgery of the nose and throat because of its ability to provide anesthesia, as well as to constrict blood vessels and limit bleeding. Many of its therapeutic applications are now obsolete due to the development of safer drugs. Illicit cocaine is usually distributed as a white crystalline powder or as an off-white chunky material.

   1. The powder, usually cocaine hydrochloride, is often diluted with a variety of substances, the most common being sugars such as lactose, inositol, and mannitol, and local anesthetics such as lidocaine, benzocaine and procaine. levamisole, diltiazem and imidazole may also be present in samples. The adulteration increases the volume and thus multiples profits. Cocaine hydrochloride is generally snorted or dissolved in water and injected. It is rarely smoked because it is heat labile (destroyed by high temperatures). Cocaine salt is a fine, crystalline powder that results from the extraction of the coca plant. Theoretically several different salt forms are possible, but the bulk of the powder available is the hydrochloride salt, almost to the exclusion of others. Cocaine salt is a Schedule II substance under the California Health & Safety Code.

   2. Cocaine base is made from Cocaine salt and takes the form of "rock" or "crack". "Crack," the chunk or "rock" form of cocaine, is a ready-to-use freebase. On the illicit market, it is sold in small, inexpensive dosage units that are smoked. Smoking delivers large quantities of cocaine to the lungs, producing effects comparable to intravenous injection. Drug effects are felt almost immediately, are very intense, and are quickly over. Once introduced in the mid-1980s, crack abuse spread rapidly and made the cocaine experience available to anyone with $10 and access to a dealer. In addition to other toxicities associated with cocaine abuse, cocaine smokers suffer from acute respiratory problems including cough, shortness of breath, and severe chest pains with lung trauma and bleeding. It is noteworthy that the emergence of crack was accompanied by a dramatic increase in drug abuse problems and drug-related violence. Cocaine base is a Schedule I substance under the California Health & Safety Code.

D. The intensity of the psychological effects of cocaine, as with most psychoactive drugs, depends on the dose and rate of entry to the brain. Cocaine reaches the brain through the snorting method in three to five minutes. Intravenous injection of cocaine produces a rush in 15 to 30 seconds, and smoking produces an almost immediate intense experience. The euphoric effects of cocaine are almost indistinguishable from those of amphetamine, although they do not last as long. These intense effects can be followed by a dysphoric crash. To avoid the fatigue and the depression of coming down, frequent repeated doses are taken. Excessive doses of cocaine may lead to seizures and death from respiratory failure, stroke, or heart failure. There is no specific antidote for cocaine overdose.
Paraphernalia used for smoking crack cocaine.

Coca plants

Cocaine (benzoylmethylecgonine) is a crystalline tropane alkaloid that is obtained from the leaves of the coca plant.[5] The name comes from "coca" in addition to the alkaloid suffix -ine, forming cocaine. It is a stimulant of the central nervous system, an appetite suppressant, and a topical anesthetic.

![Cocaine molecule](image)

Methylecgonine (ecgonine methyl ester) is an alkaloid ester extracted from the leaves of plants including coca. It is also a metabolite of cocaine.

![Methylecgonine molecule](image)

Benzylecgonine is used as the main pharmaceutical ingredient in the prescription drug Esterom, a topical solution used for the relief of muscle pain.

![Benzylecgonine molecule](image)

Ecgonine is an organic chemical and tropane alkaloid found naturally in coca leaves. It has a close structural relation to cocaine.

![Ecgonine molecule](image)

Cinnamoylcocaine (Methylecgonine cinnamate) is a natural tropane alkaloid found within the Erythroxylum coca plant. Its more common name, cinnamoylcocaine, reflects its close structural similarity to cocaine. It is said to be pharmacologically inactive.

![Cinnamoylcocaine molecule](image)
Procaine is a local anesthetic drug of the amino ester group. It is used primarily to reduce the pain of intramuscular injection of penicillin, and it was also used in dentistry.

Benzocaine is a local anesthetic commonly used as a topical pain reliever. It is the active ingredient in many over-the-counter anesthetic ointments.

Lidocaine is a common local anesthetic and antiarhythmic drug. Lidocaine is used topically to relieve itching, burning and pain from skin inflammations, injected as a dental anesthetic or as a local anesthetic for minor surgery.

Levamisole was originally used as an antihelminthic to treat worm infestations in both humans and animals. Most current commercial preparations are intended for veterinary use as a dewormer in cattle, pigs, and sheep. However, levamisole has also gained prominence among aquarists as an effective treatment for *Camallanus* roundworm infestations in freshwater tropical fish.

Diltiazem is a non-dihydropyridine (non-DHP) member of the class of drugs known as calcium channel blockers, used in the treatment of hypertension, angina pectoris, and some types of arrhythmia. It is also an effective preventive medication for migraine.

Imidazole is an organic compound with the formula $\text{C}_3\text{H}_4\text{N}_2$. This aromatic heterocyclic is a diazole and is classified as an alkaloid. The substituted imidazole derivatives are valuable in treatment of many systemic fungal infections.
Lactose (Milk sugar) Lactose is a disaccharide sugar that is found most notably in milk and is formed from galactose and glucose

Inositol is a carbohydrate, though not a classical sugar. It is almost tasteless, with a small amount of sweetness

Mannitol is a sugar alcohol; that is, it is derived from a sugar by reduction
II. Analysis

A. Presumptive Tests

1. For reagent recipes, see [DRG.13 - Reagent Preparation].

2. Two color tests are routinely used in screening for Cocaine in either the salt or the base form. The two color tests are actually derivations of the same test, Cobalt Thiocyanate (COSCN). The modified version (MCOSCN) has phosphoric acid added to the solution. Both the unmodified and modified versions of COSCN are performed on suspected Cocaine samples. In combination these tests are presumptive for Cocaine in either the base or salt form.

   a. Cocaine base is insoluble in water and will give a negative result with the water-based unmodified reagent. The phosphoric acid in the modified reagent enables the base to dissolve and therefore give a positive result matching that of the salt form.

   b. Cocaine salt is freely soluble in water and will produce a "robin's egg blue" result with COSCN.
3. A positive COSCN is an indication that one of the many Caines may be present. In addition there are other structurally unrelated compounds which may give a positive result, including Phencyclidine. Ketamine may give a weak reaction where the particles turn blue, unlike the strong, precipitous blue reaction of cocaine.

4. The Marquis color test should also be run in conjunction with the COSCN tests. Marquis may produce a salmon color in the presence of Cocaine. More importantly, however, it will quickly detect the presence of Heroin and Amphetamines. Combinations of Cocaine/Methamphetamine or Cocaine/Heroin have been encountered in the past.
   a. **Marquis** Procedure: Add a toothpick full of the questioned sample powder to one drop of reagent. A salmon reaction may occur with Cocaine. Indicate the color formed
   b. **Cobalt Thiocyanate** Procedure: Add a toothpick of the questioned material to one drop of the reagent. The production of a robin's egg blue color is a positive test. Indicate the color formed
   c. **Cobalt Thiocyanate (Modified)** Procedure: Add a toothpick of the questioned material to one drop of the reagent. The production of a robin's egg blue color is a positive test. Indicate the color formed

B. Confirmatory Tests

1. Color tests may give a presumptive indication of the form of cocaine, but infrared spectroscopy is required to confirm the form of cocaine (base or salt). GC/MS can only identify a substance as cocaine, it cannot distinguish between base and salt forms.

2. The GC/MS can be used to confirm Cocaine or other Caines. The recommended procedure for running a sample is as follows:
   a. Solvent Extraction
      i. Take a small quantity of the powder or liquid to be analyzed.
      ii. If the presumptive tests indicate cocaine salt is present, then extract using methanol. Cocaine salt is freely soluble in methanol and somewhat soluble in petroleum ether.
      iii. If the presumptive tests indicate cocaine base is present, then extract using petroleum ether. Cocaine base is soluble in methanol and freely soluble in petroleum ether.
      iv. **Note:** Methanol is not a suitable solvent if water is present in the sample. If it is suspected that water is present (e.g. syringe contents) then a basic chloroform extract should be performed. Typically cocaine salt is found in syringe contents. If a basic chloroform extract is performed then the sample should be reported as "cocaine", as basifying the sample would convert any salt present into base.
      v. A suitable internal standard, like n-Tricosane, may be used.
   b. Analysis
      i. The commonly used methods on the GC/MS are GEN.m, dea.m, and opiate.m. The opiate.m method is used only following a positive screening test and no indication of early eluting compounds of interest (such as methamphetamine). For a general unknown, use Gen.m.
      ii. Inject on the GC/MS. Use the smallest amount of sample and injection volume to get good spectra for positive ID. GC/MS may be used to identify Cocaine and FTIR should be used to distinguish between salt and base forms. When the form is determined, the sample should be reported as "cocaine salt" or "cocaine base". If the form cannot be determined, the sample should be reported as "cocaine".
      iii. Always inject a blank solvent containing the internal standard before injecting the unknown sample onto the GC/MS.
      iv. On occasion the samples may be weak such that the molecular ion of the drug is not detected. Such samples need to be concentrated to be identified. More of the sample may need to be extracted, or a larger volume of sample may need to be injected.
3. Infrared Spectroscopy is a means of positively identifying a sample. The major drawback is that the sample must be almost completely free of any diluents or must be "cleaned-up." This clean-up can take the form of a solvent extraction for differential solubility of the compound of interest and the diluents and or the contaminants present in the street samples. See DRG.29 for more information about clean-up techniques.

a. Differentiation of the Base and Salt forms of Cocaine based on Absorption Regions

i. The analyst will use the FTIR to distinguish between the base and salt forms of cocaine. The sample may be analyzed directly or after a clean-up. The IR spectrum is able to give the analyst information about the base or salt form of cocaine even if it has been adulterated.

ii. There are specific absorption regions that can be used to distinguish between base and salt. There are two main absorption regions that are used to distinguish between the base and salt forms of cocaine: the 1750-1700 cm\(^{-1}\) and the 735-705 cm\(^{-1}\) regions (Morales 2000 and Raverby 1987). These regions were selected due to the fact that some common adulterants do not show absorption bands in these regions. Lidocaine, procaine, benzoic acid, tetracaine, nicotinamide and caffeine were specifically evaluated in the reference article (Morales 2000). There is some difference between the average peak number observed in laboratory analysis and the reference articles (Morales 2000 and Raverby 1987), this can be explained by the data being acquired by internal reflection spectroscopy (ATR) versus absorption or transmission techniques (Koulis, et al. 2001).

1. In the 1750-1700 cm\(^{-1}\) region, cocaine base has a carboxylic acid methyl ester carbonyl where absorption occurs around 1735.03 cm\(^{-1}\) and a benzoyloxy carbonyl where absorption occurs around 1706.89 cm\(^{-1}\).

2. In the 1750-1700 cm\(^{-1}\) region, cocaine salt has two carbonyl bands where absorption occurs around 1728.20 cm\(^{-1}\) and around 1712.03 cm\(^{-1}\) respectively.

3. In the 735-705 cm\(^{-1}\) region, cocaine base has two absorption bands around 722.74 cm\(^{-1}\) and around 712.45 cm\(^{-1}\).

4. In the 735-705 cm\(^{-1}\) region, cocaine salt has one absorption band around 730.07 cm\(^{-1}\).

iii. For use in casework, the sample should be compared to spectra from both cocaine base and salt to distinguish the differences in the absorption bands, some examples are attached. It is helpful to print the entire spectrum and then "zoom" in on the two areas of interest and label the peaks accordingly to illustrate the differences between the base and salt forms of cocaine. (see example below)
III. Policy: Study Topics for the analyst to review with the Trainer.

A. The trainer may review the study topics with the analyst in a written or oral format. The trainer should document that the review has occurred.

1. Describe the color reaction that one would expect for Cocaine Base with the following color tests.
   a. Cobalt Thiocyanate,
   b. Modified Cobalt Thiocyanate. Explain why cocaine base reacts with one color test and not the other.

2. How is cocaine base produced from cocaine hydrochloride? How does "crack" differ from "free base"?

3. Describe the laboratory method(s) used to differentiate between cocaine salt and cocaine base.

4. Describe how you would extract for cocaine in an aqueous solution to prepare it for GC/MS analysis. Why is methanol not a recommended extraction solvent for cocaine in an aqueous solution?

END OF DOCUMENT
I. Policy: Below is general information regarding GHB.

Gamma-hydroxybutyric acid = C₄H₈O₃
MW=104

A. Gamma-hydroxybutyric acid was made a Schedule II controlled substance in California under Health and Safety Code in 2000. In 2002 GHB was moved to Schedule I, if no application for its use has been approved under Section 505 of the Federal Food, Drug and Cosmetic Act. If such an application for its use is not approved then it falls under Schedule III. This drug has been classified as a date rape drug along with Flunitrazepam. Previously this drug was widely sold in health food stores as a weight control drug and to induce the secretion of growth hormone for bodybuilding. GHB is structurally similar to the neurotransmitter gamma-aminobutyric acid (GABA).

B. In recent years, gamma hydroxybutyric acid (GHB) has emerged as a significant drug of abuse throughout the United States. Abusers of this drug fall into three major groups: (1) users take GHB for its intoxicant or euphoriant effects; (2) bodybuilders who abuse GHB for its alleged utility as an anabolic agent or as a sleep aid; and (3) individuals who use GHB as a weapon for sexual assault. These categories are not mutually exclusive and an abuser may use the drug illicitly to produce several effects. GHB is frequently taken with alcohol or other drugs that heighten its effects and is often found at bars, nightclubs, rave parties, and gyms. Teenagers and young adults who frequent these establishments are the primary users. Like flunitrazepam, GHB is often referred to as a "date-rape" drug. GHB involvement in rape cases is likely to be unreported or unsubstantiated because GHB is quickly eliminated from the body making detection in body fluids unlikely. Its fast onset of depressant effects may render the victim with little memory of the details of the attack.

C. GHB produces a wide range of central nervous system effects, including dose-dependent drowsiness, dizziness, nausea, amnesia, visual hallucinations, hypotension, bradycardia, severe respiratory depression, and coma. The use of alcohol in combination with GHB greatly enhances its depressant effects. Overdose frequently requires emergency room care, and many GHB-related fatalities have been reported.

D. Gamma butyrolactone (GBL) and 1,4-butanediol are GHB analogues that can be used as substitutes for GHB. When ingested, these analogues are converted to GHB and produce
identical effects. GBL is also used in the clandestine production of GHB as an immediate precursor. Both GBL and 1,4-butanediol have been sold at health food stores and on various internet sites.

E. The abuse of GHB began to seriously escalate in the mid-1990s. For example, in 1994, there were 55 emergency department episodes involving GHB reported in the Drug Abuse Warning Network (DAWN) system. By 2002, there were 3,330 emergency room episodes. DAWN data also indicated that most users were male, less than 25 years of age, and taking the drug orally for recreational use.

F. GHB was placed in Schedule I of the CSA in March 2000. Gamma butyrolactone (GBL) was made a List I Chemical in February 2000. GHB has recently been approved as a medication (Xyrem™) for the treatment of cataplexy associated with some types of narcolepsy. This approved medication is in Schedule III of the CSA.

G. GHB is easily synthesized from gamma-butyrolactone (GBL) and 1-4, Butanediol (1-4,BD). These are controlled as the immediate precursors to GHB under the Controlled Substance Act under Schedule I.

![Chemical structures of GBL and GHB](image)

H. GHB is often encountered in a liquid form. GHB is very hygroscopic and will usually be moist if it is the solid/powder form. (The potassium salt is more hygroscopic than the sodium salt). Other forms include a white paste-like material, or white waxy soap-like chunks. Liquid GHB and GBL have a slight odor of "burnt plastic". GHB is soluble in water and alcohols; it is insoluble in petroleum ether, ethyl ether, chloroform, and methylene chloride. GBL is soluble in chloroform, methylene chloride, alcohols, ether, and benzene.

I. GHB in an aqueous matrix will exist in equilibrium with its lactone. GHB will cyclize to the lactone (GBL) at the temperatures used during GC/MS analysis. To identify GHB and or GBL, they first need to be separated and then independently confirmed. Either GC or IR analysis can accomplish this.

J. The Gas Chromatography/Mass Spectrometer (GC/MS).and or the color tests may be used as a screening test. If it is necessary to confirm the presence of GHB, use FTIR or derivatize the GHB sample prior to injection on the GC/MS.

K. Below is general information regarding 1, 4 Butanediol:

![Chemical structure of 1,4-Butanediol](image)

1, 4-Butanediol= $C_4H_{10}O_2$

MW= 90

1. 1,4-butanediol (BD), an analog and "pro-drug" of gamma-hydroxybutyric acid (GHB), is increasingly being added to so-called dietary, health, sleep aid, or sports (bodybuilding) supplements, and is also being sold on the Internet and on underground markets for purposes of illicit abuse.
2. BD is an important industrial solvent and precursor with numerous applications; for this reason, it is widely available. On the underground market, BD is most commonly seen in illicit dietary, health, sleep aid, or sports (bodybuilding) "supplements", and also as the primary ingredient or a major component in various "solvents" of nebulous makeup and dubious claimed applications. Soma, for example, is labeled as a dietary supplement and sold in 32 oz bottles, and is marketed as a "sleep aid". The label on the bottle itself states that 2.0 grams of BD have been added per 1 fluid oz. Although various warning and/or disclaimer labels are usually present on such products, there is no mention that BD is a Schedule I controlled substance if intended/sold for human consumption.

3. All of these various supplements and solvents are commonly obtained through Internet (usually from foreign sources) and on the underground drug market, especially at "Raves" and concerts, but also at gymnasiums and similar sports/bodybuilding venues.

4. Not surprisingly, BD (like GHB and GBL) has also been implicated in drug facilitated sexual assaults. Abusers of BD indicate that its ingestion results in some unpleasant side effects, including a hangover. Therefore, some clandestine laboratories convert BD to GBL, which is the lactone of GHB and therefore a more direct pro-drug of GHB.

L. Below is general information regarding GBL:

1. Gamma-Butyrolactone is a colorless liquid which is oily, has a weak odor, and is water soluble. It is actually a fairly common reagent in chemistry, and a common solvent. It can also be used as a stain remover, an aroma compound, a paint stripper, a superglue and as a solvent in some capacitors, namely aluminum electrolytic capacitors.

2. Gamma-Butyrolactone goes by several names, including GBL, butyrolactone, 1.4-lactone, 4-butyrolactone, 4-hydroxybutyric acid lactone, and also gamma-hydroxybutyric acid lactone. It can be found in samples of wines that are unadulterated, and it seems that this is how it is produced naturally. It can be synthesized from gamma-hydroxybutyric acid by removal of any water, or even by distillation. GBL can also be obtained through the oxidation of tetrahydrofuran.

3. Gamma-Butyrolactone is a chemical which has been used for years as a solvent. As a solvent, it has found many uses. It has been used in pesticides as well as for photochemical etching. It has been used in the electrolytes of small capacitors and batteries. It has been as a viscosity modifier in polyurethane.

4. It has found a useful place in the practice of surface etching metal coated plastics. It has also been used in organic paint disbursement products for water soluble inks. It has been used in pH regulators, in the dying of polyamide fibers and wool, and as a catalyst during curing procedures. It can also be used as a curing agent for coating systems and/or urethanes and amides.

5. In humans it acts as a prodrug for GHB, and it is used as a recreational intoxicant.

M. Both GBL and 1-4 BD are also converted to GHB in vivo as noted below:
N. Following is an outline of the procedures presently in use at this laboratory. The tests and their implications are discussed. The specific instructions on how to perform the tests are provided in the individual sections of this manual.

O. Steps Taken To Identify GHB:
1. Color screening tests. Dry liquid sample if they are too diluted.
2. GC/MS using GHB.m or GEN.m as a screening tool. If butyrolactone is present then proceed with the steps below, otherwise analyze as a general unknown.
3. Dry sample completely for FTIR confirmation.
   a. The sodium salt will dry to a white substance and is amenable to FTIR
   b. The potassium salt does not dry completely and may not be detectable by FTIR
4. GC/MS confirmation using the derivatizing agents when FTIR is insufficient or unavailable.

II. Policy: Below is information regarding screening GHB.

A. Presumptive Tests
1. Color tests are presumptive tests and may be preformed to screen samples for the presence of GHB. GHB will not react with most of the color tests routinely used to screen samples in this laboratory. 1-4 BD does not give color test with FeCl₃ or Cobalt Nitrate. GBL by itself does not react with these color tests.
   a. 5% Ferric Chloride
      i. Reagent: 5 grams of ferric chloride in 100 ml of water.
      ii. Procedure: Add a toothpick full (or drop if liquid) of the questioned sample to one drop of reagent.
      iii. Indicate the color formed
      iv. NOTE: This color test works well with both liquid and solid GHB samples. A reddish-orange color indicates a positive with any alkaline

\[
\begin{align*}

\text{ Alcohol} \\
\text{HO-CH₂-CH₂-CH₂-COOH} \\
\text{Acid} \\
\gamma\text{-Butyrolactone} \\
\text{Reagent} \\
\text{OH-CH₂-CH₂-CH₂-COOH} \\
\text{H₂N-CH₂-CH₂-CH₂-COOH}
\end{align*}
\]
solution.

b. 1% Cobalt Nitrate
   i. Reagent: 3.9 grams of Cobaltous Nitrate in 500 ml of Methanol.
   ii. Procedure: Add a toothpick full of the questioned sample powder to one drop of reagent. A light purple color indicates a positive. KOH and NaOH give a gray color.
   iii. NOTE: This test does not work well with liquid samples. If necessary, dry a couple of drops in a 58 degree C oven prior to the color test.
   iv. Indicate the color formed.

B. GC/MS SCREEN

1. GHB itself is not amenable to GC/MS analysis. It either needs to be converted to its lactone form or derivatized for confirmation using GC/MS. However, GC/MS can be used as a quick screen to check the liquid or solid samples containing GHB or 1,4 butanediol.

2. Liquid Sample:
   a. A liquid sample of GHB exists in equilibrium with GBL. If the sample is received in a liquid form, chloroform extract of the sample should be injected on GC/MS using GHB.m or GEN.m to check for butyrolactone. If butyrolactone is present then proceed for confirmation as listed under confirmatory steps.
      i. Gamma-Valerolactone is the internal standard used for the GHB extraction.
         1. 1% solution in water (0.1 ml valerolactone into 10 ml water)
   b. If 1,4 butanediol is detected in the sample, Benzaldehyde is the recommended internal standard to be used for confirmation.

3. Solid Sample: If the sample is received in a solid form a methanol extract of a healthy amount of sample may be injected (The heat of the sample injection port converts GHB to its lactone form).

4. Note: The Sodium salt of GHB (used as the laboratory standard) is not soluble in Chloroform.

III. Policy: Below is information regarding confirmation of 1,4 butanediol.

A. A chloroform extract of the sample can be run on the GC/MS using the GHB.m or GEN.m methods.

B. Benzaldehyde is the recommended internal standard

IV. Policy: Below is information regarding confirmation of GHB.

A. Liquid Sample Prep
   1. In the liquid samples GHB occurs in equilibrium with the lactone form. In order to confirm GHB, all of the lactone must be removed from the sample.
2. The following cleanup steps should be done prior to analyzing samples by FTIR or derivatizing samples for GC/MS analysis.

3. **Clean-up Procedure for Removing the Lactone from the sample:**
   a. Place approximately 2.0 ml of the case sample into a culture tube
   b. Add 0.5 ml of chloroform
   c. Vortex
   d. Centrifuge
   e. Remove the chloroform layer (can be analyzed for the presence of GBL)
   f. Add 1 ml of acetone or chloroform
   g. Vortex
   h. Centrifuge
   i. Remove the acetone or chloroform layer and discard
   j. Repeat the four above steps at least two more times
   k. Dry the remaining aqueous layer by placing the culture tube in the heating block

4. **Derivatizing Samples for GC/MS Confirmation:**
   a. Label clean dry culture tubes, one each with the following.
      i. "BLANK"
      ii. "STANDARD"
      iii. "Lab Number" for each case examined
   b. The tube for each case sample is the final aqueous solution from the sample preparation listed above (before drying)
   c. Add approximately 10 mg of GHB to the "STANDARD" tube
   d. Dry the samples on the heating block
   e. Prepare the Undecane (Internal Standard) by diluting 20 ul of Undecane in 1 ml of Ethyl Acetate. One drop of this solution contains 2 µl of Undecane. Add 1 drop (2 µl) to each culture tube
   f. Add 125 µl of BSTFA with 1% TMCS to each culture tube
   g. Vortex
   h. Add 2 ml (2000 µl) of Ethyl Acetate to each culture tube
   i. Vortex
   j. Cap each tube and place in a 60 degree C-heating block for 15 minutes
   k. Transfer each sample, after it has cooled, to an auto-sampler vial with a glass insert
   l. Inject 1 µl into the GC/MS using GHB.m or GEN.m
5. **Mass Spectra of GHB TCMS Derivative**
   a. The molecular ion is m/z 248, but is not always seen at lower concentrations.
   b. Ions common to TCMS derivatives include m/z 73, 147, and 243.
   c. For identification, ions m/z 117 (10%), 133 (2%), 159 (1%), 204 (5%), and 233 (10%) need to be present at the proper retention time.
   d. At high enough concentrations, the molecular ion, m/z 248 (1%) may be present.

B. **Gas Chromatography/Mass Spectrometry of Underivatized sample:**
   1. In the following method the Gamma hydroxy butyrate (GHB) is converted to its lactone, gamma-butyrolactone (GBL). This confirmatory step follows a positive GC/MS screen for GBL listed under GC/MS screen test.
   2. The lactone in the sample is first removed by approximately six washes with Chloroform as listed previously under liquid sample prep.
   3. The last Chloroform extract is injected to ensure most of the lactone has been removed from the sample prior to the conversion of the GHB to the lactone using a mineral acid.
   4. **Materials:**
      a. 10 ml glass test tubes
      b. conc. Sulfuric Acid
      c. 1.2 normal Potassium Hydroxide (KOH)
      d. Chloroform
      e. Distilled water
      f. Gamma-Valerolactone diluted to 1/100 in WATER for internal standard stock solution
      g. Gamma hydroxy butyrate, sodium

5. **Procedure-Conversion/Extraction of unknown sample:**
   a. Add 0.25 ml of unknown liquid to a test tube, then add 0.75 ml of WATER
   b. Add 1 ml of conc. SULFURIC ACID a drop at a time
   c. Let cool
   d. Add 1 ml of 1.2 normal KOH a drop at a time
   e. Add 0.1 ml of internal standard stock solution
   f. Add 2 ml of Chloroform
   g. Vortex 30 seconds
   h. Centrifuge, then remove the Chloroform layer for GC/MS analysis

6. **Procedure-Conversion/Extraction of GHB Standard:**
a. Take 0.1 ml of 1/100 dil. GHB standard and add to test tube
b. Add 0.9 ml of WATER
c. Add 1 ml of conc. SULFURIC ACID a drop at a time
d. Let cool
e. Add 1 ml of 1.2 normal KOH a drop at a time
f. Add 0.1 ml of internal standard stock solution
g. Vortex 30 seconds
h. Centrifuge, then remove the Chloroform layer for GC/MS analysis

7. **Procedure-Extraction of gamma-Valerolactone for blank**
   a. Take 0.1 ml of internal standard stock solution and add 2.9 ml of WATER
   b. Add 2 ml of Chloroform
c. Vortex 30 seconds
d. Centrifuge, then remove the Chloroform layer for GC/MS blank

C. **FTIR**
   1. Infrared Spectrophotometry should be used only on very dry sample of GHB. The sodium salt of GHB can be dried. However the Potassium salt of GHB is hygroscopic and does not dry very well despite the time it is kept for drying.

   2. The liquid sample should go through the liquid sample prep listed previously under confirmatory tests to remove most of the GBL from the sample. The liquid sample should then be dried (preferably under a stream of air to expedite the drying). The dried sample should then be used to analyze directly on ATR or prepare the KBR pellet for FTIR. Identification is made by comparison against a known spectrum.

V. **Policy: Study Topics for the analyst to review with the Trainer.**
   A. The trainer may review the study topics with the analyst in a written or oral format. The trainer should document that the review has occurred.

   1. Explain the relationship between GHB, GBL and 1-4 butanediol.
   2. Describe the limitation of analyzing underivatized GHB using a GC/MS.
   3. Draw the structure of the derivatized GHB when using the procedure describe in the Controlled Substance Procedures Manual.
   4. Describe how GHB and GBL equilibrium in aqueous solution may be affected by the addition of a) strong alkaline solution and b) strong acidic solution.
   5. What are the limitations of confirming GHB by FTIR?
   6. What is the legitimate use of GHB, GBL?

### Policy

Below is general information regarding LSD.

1. Lysergic acid diethylamide (LSD)

   ![LSD molecule](image1)

2. Lysergic acid amide

   ![Lysergic acid amide](image2)
C. Lysergic acid N,N-methylpropylamide (LAMPA)

D. Lysergic Acid Diethylamide (LSD) is a hallucinogen that can be encountered in this laboratory. LSD may take the form of small tablets or blotter paper.

E. In the blotter paper form, the drug is impregnated onto the paper, which is then ingested by the user. The paper is normally perforated into many small squares with a wide range of designs. Microgram is an excellent source for examples of the many designs encountered throughout the country.

F. The concentration of the drug on the paper is in the microgram range. The procedures available for the analysis of LSD in this laboratory are limited, but very selective and sensitive.

G. Lysergic acid diethylamide (LSD) is the most potent hallucinogen known to science, as well as the most highly studied. LSD was originally synthesized in 1938 by Dr. Albert Hoffman. However, its hallucinogenic effects were unknown until 1943 when Hoffman accidentally consumed some LSD. It was later found that an oral dose of as little as 0.000025 grams (or 25 micrograms, equal in weight to a couple grains of salt) is capable of producing rich and vivid hallucinations.

H. Because of its structural similarity to a chemical present in the brain and its similarity in effects to certain aspects of psychosis, LSD was used as a research tool to study mental illness. LSD abuse was popularized in the 1960s by individuals like Timothy Leary who encouraged American students to "turn on, tune in, and drop out." LSD use has varied over the years but it still remains a significant drug of abuse.

I. The average effective oral dose is from 20 to 80 micrograms with the effects of higher doses lasting for 10 to 12 hours. LSD is usually sold in the form of impregnated paper (blotter acid), typically imprinted with colorful graphic designs. It has also been encountered in tablets (microdots), thin squares of gelatin (window panes), in sugar cubes and, rarely, in liquid form.

J. Physical reactions may include dilated pupils, lowered body temperature, nausea, "goose bumps," profuse perspiration, increased blood sugar, and rapid heart rate. During the first hour after ingestion, the user may experience visual changes with extreme changes in mood. In the hallucinatory state, the LSD user may suffer impaired depth and time perception, accompanied by distorted perception of the size and shape of objects, movements, color, sound, touch, and the user's own body image. During this period, the ability to perceive objects through the senses is distorted: a user may describe "hearing colors" and "seeing sounds." The ability to make sensible judgments and see common dangers is impaired, making the user susceptible to personal injury. After an LSD "trip," the user may suffer acute anxiety or depression for a variable period of time. Flashbacks have been reported days or even months after taking the last dose.
K. The following is an outline of the procedures that may be employed for the identification of LSD. For instruction on technique, consult the appropriate section.

II. Policy: Below is information regarding screening LSD.

A. Presumptive Tests
1. pDMBA (para-dimethylaminobenzaldehyde), also referred to as Van Urk's reagent, is the color test used for the presumptive screening of LSD and related compounds. In general, a purple reaction with the acidified pDMBA test occurs with indoles, pyrroles, and tryptophans and is an indication of the presence of a hallucinogen; including LSD.

2. Fluorescence: LSD is highly fluorescent. This property can be utilized in two ways.
   a. The first is a direct examination of the paper under longwave ultra violet light. If the paper fluoresces, it is an indication that LSD may be present. However, many dyes that are typically present on blotter paper may also fluoresce.
   b. The interference of this background fluorescence may be eliminated by using a second technique. This involves taking a small section of the blotter paper and placing it on a piece of filter paper. Add a drop of methanol and observe the section under longwave UV light. A leeching out effect should be observed if any LSD is present. The methanol is removing the LSD from the blotter paper and distributing it (and the fluorescence) across the filter paper. These tests for fluorescence are very sensitive. The absence of fluorescence in combination with a negative pDMBA is an excellent indication that LSD is absent.
   c. Acidified pDMBA: 
      i. Reagent:
         1. 0.01g of para-dimethylaminobenzaldehyde in 18 ml of ethanol and 2 ml of concentrated Sulfuric Acid (\(\text{H}_2\text{SO}_4\)).
         2. Concentrated Hydrochloric Acid (HCl).
      ii. Procedure: Add a small section of the blotter paper or tablet to one drop of solution a. Next, add one drop of solution b. A purple color, which may be slow to form, is an indication that LSD is present.
      iii. Indicate the color formed.
   d. Ultra Violet Fluorescence:
      i. Procedure: Place the blotter paper in the UV light hood. Observe the paper under longwave UV light. Positive fluorescence indicates that LSD may be present.
      ii. Note: This technique is subject to background interference from dyes.
      iii. Place a small section of the blotter paper (approximately 1 mm square) onto a piece of filter paper and place in the UV light hood. Next add a drop of methanol to the blotter paper and observe under longwave UV light. Any leeching of fluorescence out and away from the blotter paper is an indication that LSD is present.
      iv. Note the Positive fluorescence under UV
      v. Note the Methanol leaching and Positive fluorescence
III. Policy: Below is information regarding confirmation of LSD.

A. The GC/MS can be used to confirm LSD. The recommended procedure for running a sample is as follows:

1. Solvent Extraction
   a. Take a small quantity of the sugarcube, blotter paper, powder or liquid to be analyzed.
   b. Extract out with methanol or suitable solvent based on the analyte characteristics and solubility information.
   c. It should be noted that methanol is not a suitable solvent if it is suspected that water is present in the sample. If it is suspected that water is present in the sample then an Acidic Chloroform extract should be used.
      i. Basic Chlorobutane is an acceptable alternate extraction for liquid samples.
   d. Add a suitable internal standard, n-Tricosane is commonly used as an internal standard. It may be necessary to use a dilute internal standard.

2. Analysis
   a. The commonly used method on the GC/MS is GEN.m.
      i. Both LSD and LAMPA will elute in the GEN.m method.
   b. A standard that contains both LSD and LAMPA should be used for confirmation.
      i. This is due to the substantial similarity between the mass spectra of LSD and LAMPA
   c. As a routine, 1 µl is injected on the GC/MS
   d. Always inject a blank solvent containing the internal standard before injecting the unknown sample onto the GC/MS (n-Tricosane is commonly used).
   e. Samples may need to be concentrated to be identified. More of the sample may need to be extracted, or a larger volume of sample may need to be injected on the GC/MS

<table>
<thead>
<tr>
<th>Compound</th>
<th>Retention Time</th>
<th>Relative Retention Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSD</td>
<td>16.65</td>
<td>1.68</td>
</tr>
<tr>
<td>LAMPA</td>
<td>17.39</td>
<td>1.75</td>
</tr>
</tbody>
</table>

Note: Retention times may vary based on the concentration of the compound
injected on the GC/MS. Generally, highly concentrated samples have slightly increased retention times.

B. Infrared spectroscopy is a useful means of identifying a substance. However, most evidence material submitted must be extracted and concentrated before an acceptable infrared spectrum may be obtained.

1. Due to the low concentration of drug seen in "street samples" this is not a method choice for the confirmation of LSD.

IV. **Policy:** Study Topics for the analyst to review with the Trainer.

A. The trainer may review the study topics with the analyst in a written or oral format. The trainer should document that the review has occurred.

1. What is the chemical name for LSD?
2. Describe the preliminary test for suspected blotter paper containing LSD using UV light. Why is necessary to do the methanol leeching?
3. How can one distinguish the difference between LSD and its isomer LAMPA if both were analyzed using a GC/MS?
4. What is the reagent that is typically used a preliminary color test for LSD? What is the expected color reaction?
5. How would light exposure of LSD impact the concentration of the drug in the sample?
6. What are the procedures for drug extraction from liquid samples?
7. What safety precautions need to be adopted when handling LSD samples and why?

G. Drug Identification Bible, 4th Edition. Published by Amera-Chem
I. Policy: Below is general information regarding Marijuana and Cannabinoids.

A. Marijuana is the common name for the hemp plant of the family Cannabinaceae known as Cannabis sativa. Its closest relatives are the hops (Humulus japonicus and Humulus lupulus).

B. The following legal definitions are from the 2009 California Drug Laws sections 11018 and 11006.5 respectively:

1. "Marijuana* means all parts of the plant Cannabis sativa L., whether growing or not; the seeds thereof; the resin extracted from any part of the plant; and every compound, manufacture, salt, derivative, mixture, or preparation of the plant, its seeds or resin. **It does not include** the mature stalks of the plant, fiber produced from the stalks, oil or cake made from the seeds of the plant, any other compound, manufacture, salt, derivative, mixture, or preparation of the mature stalks (except the resin extracted therefrom), fiber, oil, or cake, or the sterilized seed of the plant which is incapable of germination.

   a. Marijuana seeds are not identified by the Laboratory. The seeds have to be viable to be identified, which requires them to be germinated.

   2. "Concentrated cannabis" means the separated resin, whether crude or purified, obtained from marijuana.

   a. The Laboratory does not identify "concentrated cannabis". In samples where the plant material cannot be identified by the morphological features of the marijuana leaf (having both cutinolic and clothing hairs) the sample is identified as delta-9-THC.

C. Cannabis sativa L., the cannabis plant, grows wild throughout most of the tropic and temperate regions of the world. Prior to the advent of synthetic fibers, the cannabis plant was cultivated for the tough fiber of its stem. In the United States, cannabis is legitimately grown only for scientific research.

1. Cannabis contains chemicals called cannabinoids that are unique to the cannabis plant. Among the cannabinoids synthesized by the plant are cannabinol, cannabidiol, cannabidiolic acids, cannabigerol, and several isomers of tetrahydrocannabinol. One of these, delta-9-tetrahydrocannabinol (THC), is believed to be responsible for most of the characteristic psychoactive effects of cannabis. Research has resulted in development and marketing of the dronabinol (synthetic THC) product, Marinol™, for the control of nausea and vomiting caused by chemotherapeutic agents used in the treatment of cancer and to stimulate appetite in AIDS patients. Marinol™ was rescheduled in 1999 and placed in Schedule III of the CSA.

2. Cannabis products are usually smoked. Their effects are felt within minutes, reach their peak in 10 to 30 minutes, and may linger for two or three hours. The effects experienced often depend upon the experience and expectations of the individual user, as well as the activity of the drug itself. Low doses tend to induce a sense of well-being and a dreamy state of relaxation, which may be accompanied by a more vivid sense of sight, smell, taste, and hearing, as well as by subtle alterations in thought formation and expression. This state of intoxication may not be noticeable to an observer. However, driving, occupational, or household accidents may result from a distortion of time and space relationships and impaired motor coordination. Stronger doses intensify reactions. The individual may experience shifting sensory imagery, rapidly fluctuating emotions, fragmentary thoughts with disturbing associations, an altered sense of self-identity, impaired memory, and a dulling of attention despite an illusion of heightened insight. High doses may result in image distortion, a loss of personal identity, fantasies, and hallucinations.

3. Three forms of cannabis—marijuana, hashish, and hashish oil—are distributed on the U.S. illicit market. Having no currently accepted medical use in treatment in the United States, they remain under Schedule I of the CSA. Today, cannabis is illicitly cultivated, both indoors and out, to maximize its THC content, thereby producing the greatest possible psychoactive effect.

4. The cannabis plant contains more than 400 chemicals and several of them are psychoactive. By far the most psychoactive is delta-9- tetrahydrocannabinol (THC), found in the plants resin. The resin is most concentrated in the flowers, but can also be found in small amounts in the vegetative leaves and stalks.

D. Marijuana varies significantly in its potency, depending on the source and selection of plant materials used. The form of marijuana known as sinsemilla (Spanish, sin semilla: without seed), derived from the unpollinated female cannabis plant, is preferred for its high THC content. Marijuana is usually smoked in the form of loosely rolled cigarettes called joints, bongs, or hollowed out commercial cigars called blunts. Joints and blunts may be laced with a number of adulterants or two of this liquid on a cigarette is equal to a single "joint" of marijuana.

1. The products made from marijuana plants for psychoactive effects vary in their THC content and therefore in their psychoactive potency.

   a. Low-grade marijuana is made from all the leaves of both sexes of the plant. The THC content of dried vegetative leaves may be only 1%.

   b. Medium-grade marijuana is made from dried flowering tops of female cannabis plants raised with and fertilized by male plants.

   c. High-grade marijuana is made from the flowering tops of female plants raised in isolation from male plants. The resulting marijuana is called sinsemilla, which means "without seeds". The THC content varies from 5 to11%.

2. The active oils from Marijuana that are responsible for its pharmacological activity are called cannabinoids. The phenolic character of the cannabinoids is very weak, so in solvent solutions they can be regarded as neutral.

3. Hashish consists of the THC-rich resinous material of the cannabis plant, which is collected, dried, and then compressed into a variety of forms, such as balls, cakes, or cookie-like sheets. Pieces are then broken off, placed in pipes, and smoked. The Middle East, North Africa, and Pakistan/Afghanistan are the main sources of hashish. The THC content of hashish that reached the United States, where demand is limited, averaged about five percent in the 1990s.

4. The term "hash oil" is used by illicit drug users and dealers, but is a misnomer in suggesting any resemblance to hashish. Hash oil is produced by extracting the cannabinoids from plant material with a solvent. The color and odor of the resulting extract will vary, depending on the type of solvent used. Current samples of hash oil, a viscous liquid ranging from amber to dark brown in color, average about 15 percent THC. In terms of its psychoactive effect, a drop or two of this liquid on a cigarette is equal to a single "joint" of marijuana.

5. From about 20 cannabinoids isolated from the plant, only a few are of a forensic importance.

6. Marijuana contains known toxins and cancer-causing chemicals. Marijuana users experience the same health problems as tobacco smokers, such as bronchitis, emphysema, and bronchial asthma. Some of the effects of marijuana use also include increased heart rate, dryness of the mouth, reddening of the eyes, impaired motor skills and concentration, and hunger with an increased desire for sweets. Extended use increases risk to the lungs and reproductive system, as well as suppression of the immune system. Occasionally, hallucinations, fantasies, and paranoia are reported. Long-term chronic marijuana use is
associated with an Amotivational Syndrome characterized by: apathy; impairment of judgment, memory and concentration; and loss of interest in personal appearance and pursuit of goals.

Marijuana is rolled either into cigarettes (called joints) or cigars (called blunts) for smoking.

Hashish is produced when the resin of the cannabis plant is separated from the plant material. It often appears as a dark, colored gummy ball, rather hard but not brittle. The average THC content of hashish is around 9%, but can vary up to 20%.

Hashish is often smoked in a pipe or rolled into a cigarette along with tobacco or lower-grade marijuana.

Hash oil is the most potent of the preparations made from cannabis plant. The plant is boiled in alcohol, and after filtering the solids and evaporating of water, a thick, waxy substance, hash oil is left. The THC content varies from 30 to 70%.

It can be smoked onto the inner rim of a pipe bowl for smoking or used to lace tobacco or marijuana cigarettes.

Leaves
Leaves have a long stalk (6 cm) with a narrow groove on the upper side. Each leaflet has a narrow elliptic blade with shallow serrated margin (saw-toothed, 4 to 14 serrations on each side), and with veins running obliquely from the midrib to the tips of the serration.

**Stem**

Angular with minute hairs pressed upward against the stem.

**Male inflorescence**

Five whitish or greenish hairy petals
Five pendulous stamens with slender filaments

**Female inflorescence**

Dark brown and forked stigmas, nearly every epidermis cell is extended as a unicellular papilla (microscopic view). Enwrapping the ovary is a short, green organ called bract (calyx), covered with slender hairs.
Fruit

Hard, one seeded (achene), 2.5 to 5 mm long, 3 mm wide.

Cross Section of a Bract from the Fruiting Plant.

II. Analysis

A. Presumptive tests

1. Screening or presumptive tests can give the analyst indication of the possible presence and type of compound or material.

2. For reagent recipes, see DRG.13 - Reagent Preparation.

3. The Duquenois-Levine test is a color test for the presence of cannabinoids (including THC). It can be used on material suspected of being marijuana or containing THC. The presumptive test is performed in two steps. The first being a color reaction (purple color is obtained from the condensation product of aromatic alcohol with an aldehyde) and the second, is the extraction of the color compound using chloroform. Duquenois-Levine test does not work as well on plants that are fresh and green or very young.

4. Usually material that comes to the Lab is mature and dry (ground up leaf fragments or residue from burned material). If the material is wet, it should be returned to the submitting agency for drying. Hashish and Hash Oil are perfect materials for the Duquenois-Levine test since they both have high concentration of THC.

   a. Duquenois-Levine procedure:
      i. Extract a small portion of the suspected plant material with Petroleum Ether into a disposable polystyrene beaker cup. Allow the Petroleum Ether to evaporate or decant the Petroleum Ether into another polystyrene beaker cup and allow to dry.
      ii. Next, add approximately 8-10 drops of Duquenois-Levine solution to the dried residue and add approximately four drops of concentrated Hydrochloric Acid. More drops of HCL will intensify the color reaction. Allow the purple color to develop
      iii. Pour the solution into a glass shell vial. Add 6-8 drops of chloroform (or enough to form a distinct bi-layer) and shake gently.
      iv. A violet-purple color in the chloroform layer is a positive reaction.
      v. Indicate the color formed (and extraction of color).

   b. Macroscopic Examination: Macroscopic means using your naked eye (no magnification or other aid) or relating to observations made by the unaided eye. It includes gross visual examination of the submitted material, describing what you see. The examination (what the analyst observed) must be documented in the notes. The following are suggested descriptions for macroscopic tests:
i. **Plant material with clustered green leaves**, with the option of adding additional information: colors, presence of stalks, stems or seeds if significant. Clustered is the assumed clustering around a stem or stalk consistent with a "bud-like" structure.

ii. **Plant material with loose green leaves**, with the option of adding additional information: colors, presence of stalks, stems or seeds if significant. This is the macroscopic description for loose leaves that do not appear to be attached to a stem or stalk.

iii. **Plant material with green leaves and stem**, with the option of adding young or attached leaves. This is the macroscopic description for "leaf clippings" or representative samples of plants when the leaves are often young.

iv. **Whole plant material with green leaves, stem and roots**, if all are present. This would be the macroscopic description for a whole plant.

B. **Confirmatory Analysis**

1. **Microscopically**: The confirmation of the presence of Marijuana may be done using a microscope. The analyst should look for and document the following characteristic on marijuana leaves or fragments:
   
   a. **Cystolithic hairs** in the form of "bear claws" on the topside of the leaf. These are unicellular hair with swollen base and curved tip. Cystoliths (knob like concentration of calcium carbonate in the cell walls) are visible as slight swellings.
      
      i. The presence of calcium carbonate deposits around the base of the cystolithic hair.
      
      ii. Leaves of young Marijuana plants usually have longer cystolithic hairs with minimal CaCO$_3$ bases. The lower surface of the blade may have more glandular hairs.
   
   b. Long, unicellular, non glandular or "Clothing hairs" on underside of the leaf, often combed in one direction.

   c. The presence of oil secreting glandular hairs.

   d. In some instances, an entire leaf may be available for examination. The leaf veining and serrated leaf margins are also helpful characteristics that aid its identification.

   e. **The examination (what the analyst observed) must be documented in the notes**. The following are suggested descriptions for microscopic tests: **Cystolithic and clothing hairs consistent with marijuana are visible on the same leaf**.

   f. **Caution**: an overabundance of resin may obscure some structural detail, especially in fragments.
      
      i. If distinct observable features are not present on a single leaf, GC/MS analysis must be performed.
      
      ii. If microscopic examination is performed and the analyst CANNOT confirm the presence of marijuana, the examination and observations MUST be recorded in the case notes.
Photograph (Stereoscan microscope) of hairs on upper surface of leaf of *Cannabis sativa*. Magnification x380. Photograph: Sims and Steam.
2. The GC/MS can be used to confirm cannabinoids. The recommended procedure for running a sample is as follows:
   a. Solvent Extraction
      i. Take a small quantity of the plant material, powder or liquid to be analyzed.
      ii. Extract out with methanol, petroleum ether, or suitable solvent based on the analyte characteristics and solubility information.
      iii. It should be noted that methanol is not a suitable solvent if it is suspected that water is present in the sample. If it is suspected that water is present in the sample then an acid/basic chloroform extract should be used.
      iv. Add a suitable internal standard, n-Tricosane is commonly used as an internal standard
   b. Analysis
      i. The commonly used methods on the GC/MS are GEN.m, dea.m or opiate.m. Use of the opiate.m, when color tests indicate, for a faster GCMS analysis completion time. Use GEN.m for an unknown.
      ii. As a routine, 1 µl is injected on the GC/MS
      iii. Always inject a blank solvent containing the internal standard before injecting the unknown sample onto the GC/MS (n-Tricosane is commonly used).
      iv. On occasion the samples may be weak such that there is insufficient spectral data. Such samples need to be concentrated to be identified. More of the sample may need to be extracted, or a larger volume of sample may need to be injected on the GC/MS
      v. The GC/MS data is below.

[Graphical representation of GC/MS data]

III. Study Topics for the analyst to review with the Trainer.

A. The trainer may review the study topics with the analyst in a written or oral format. The trainer should document that the review has occurred.

1. What constitutes a positive ID for Marijuana?
2. How many steps are there in a modified Duquenois Levine test and what are the observations indicative of marijuana?
3. What are the limitations of the color test related to the age of the plant material? What is the rationale behind it?
4. What other botanical standards maintained in the lab share the characteristics of Marijuana and how are they different?
5. What is Hashish?
6. What is Hash oil?
7. What is the predominant psychoactive component in Marijuana?

END OF DOCUMENT
I. Policy: Below is general information regarding Opiates.

A. Enhancements:

1. H&S 11352.5:
   a. Fine for possessing for sale, offering to sell or selling substance containing heroin greater than 14.25 grams.

2. H&S 11370.4a1-a6:
   a. Penalty enhancements for quantity of heroin containing 1, 4, 10, 20, 40 & 80 kg.

B. Opiates, compounds derived from Papaver somniferum, take two forms, natural and synthetic. The natural compounds are those alkaloids that are extracted from the opium poppy. Over twenty different alkaloids have been identified in opium, but only three are of significance: morphine, codeine and thebaine (Karch 1993). Examples of these compounds, in excess of twenty-five, are Morphine and Codeine. The synthetic compounds are those compounds derived from the naturally occurring alkaloids. Examples of these synthetic compounds are Heroin, Oxycodone and Oxymorphone.

C. Heroin is the most common illicit opiate encountered in this laboratory. However, many other opiates, notably Hydrodocone, Codeine and Oxycodone, make their way into this laboratory in a pharmaceutical form. Due to the potential of counterfeit pills, it may be necessary to test these pharmaceuticals to verify their narcotic content.

D. The term "narcotic," derived from the Greek word for stupor, originally referred to a variety of substances that dulled the senses and relieved pain. Today, the term is used in a number of ways. Some individuals define narcotics as those substances that bind at opiate receptors (cellular membrane proteins activated by substances like heroin or morphine), while others refer to any illicit substance as a narcotic. In a legal context, narcotic refers to opium, opium derivatives, and their semi-synthetic substitutes. Cocaine and coca leaves, which are also classified as "narcotics" in the Controlled Substances Act (CSA), neither bind at opiate receptors, nor produce morphine-like effects and are discussed in the section on stimulants. For the purposes of this discussion, the term narcotic refers to drugs that produce morphine-like effects.

E. Narcotics are used therapeutically to treat pain, suppress cough, alleviate diarrhea, and induce anesthesia. Narcotics are administered in a variety of ways. Some are taken orally, transdermally (skin patches), intranasally, or injected. They are also available in suppositories, and more recently in "troches," a form of narcotics that can be sucked like
candy. As drugs of abuse, they are often ingested orally, smoked, sniffed, or injected. Drug effects depend heavily on the dose, route of administration, and previous exposure to the drug. Aside from their medical use, narcotics produce a general sense of well-being by reducing tension, anxiety, and aggression. These effects are helpful in a therapeutic setting but contribute to their abuse. There has been a significant rise in the number of pharmaceutical narcotic pills that are abused, thus sold and possessed illegallay and submitted to the laboratory for analysis. The following data is from NFLIS Special Report: Opiates and Related Drugs Reported, 2009–2014 from the DEA website:

1. From January 2009 to June 2014, an estimated 1,430,120 opiates and related drugs were reported to the National Forensic Laboratory Information System (NFLIS). The number of reports increased by 21% over this period, from 116,647 drug reports during the first half of 2009 to 140,909 during the first half of 2014.

2. Fentanyl reports increased by 259% from the second half of 2013 to the first half of 2014. This increase was especially pronounced in the South (650 reports), Northeast (649 reports), and Midwest (637 reports).

3. Acetyl fentanyl, AH-7921, and MT-45 were first reported to NFLIS in 2013, whereas mitragynine was first reported in 2010. Acetyl fentanyl increased from 6 reports during the second half of 2013 to 43 reports during the first half of 2014.

4. According to data compiled by the Centers for Disease Control and Prevention, 202,157 deaths were the result of a drug poisoning or overdose between 2009 and 2013. Of these deaths, 57% involved heroin and natural, semisynthetic, and synthetic opiates

F. Narcotic use is associated with a variety of unwanted effects including drowsiness, inability to concentrate, apathy, lessen physical activity, constriction of the pupils, dilation of the subcutaneous blood vessels causing flushing of the face and neck, constipation, nausea, vomiting, and most significantly, respiratory depression. As the dose is increased, the subjective, analgesic (pain relief), and toxic effect become more pronounced. Except in cases of acute intoxication, there is no loss of motor coordination or slurred speech as occurs with many depressants.

G. Among the hazards of illicit drug use is the ever-increasing risk of infection, disease, and overdose. Medical complications common among narcotic abusers arise primarily from adulterants found in street drugs and in the non-sterile practices of injecting. Skin, lung, and brain abscesses, endocarditis (inflammation of the lining of the heart), hepatitis, and AIDS are commonly found among narcotic abusers. While pharmaceutical products have a known concentration and purity, clandestinely produced street drugs have unknown compositions. Since there is no simple way to determine the purity of a drug that is sold on the street, the effects of illicit narcotic use are unpredictable and can be fatal. Physical signs of narcotic overdose include constricted (pinpoint) pupils, cold clammy skin, confusion, convulsions, severe drowsiness, and respiratory depression (slow or troubled breathing). Most narcotic deaths are a result of respiratory depression.

H. With repeated use of narcotics, tolerance and dependence develop. The development of tolerance is characterized by a shortened duration and a decreased intensity of analgesia, euphoria, and sedation, which creates the need to consume progressively larger doses to attain the desired effect. Tolerant users can consume doses far in excess of the dose they initially started with

I. The poppy plant, *Papaver somniferum*, is the source for non-synthetic narcotics. It was grown in the Mediterranean region as early as 5000 B.C., and has since been cultivated in a number of countries throughout the world. The milky fluid that seeps from incisions in the unripe seed pod of this poppy has, since ancient times, been scraped by hand and air-dried
to produce what is known as opium. A more modern method of harvesting is by the industrial poppy straw process of extracting alkaloids from the mature dried plant. The extract may be in liquid, solid, or powder form, although most poppy straw concentrate available commercially is a fine brownish powder. More than 500 tons of opium or equivalents in poppy straw concentrate are legally imported into the United States annually for legitimate medical use.

1. **Opium**
   
   a. There were no legal restrictions on the importation or use of opium until the early 1900s. In the United States, the unrestricted availability of opium, the influx of opium-smoking immigrants from East Asia, and the invention of the hypodermic needle contributed to the more severe variety of compulsive drug abuse seen at the turn of the 20th century. In those days, medicines often contained opium without any warning label. Today, there are state, federal, and international laws governing the production and distribution of narcotic substances.
   
   b. Although opium is used in the form of paregoric (camphorated tincture of opium of opium) to treat diarrhea, most opium imported into the United States is broken down into its alkaloid constituents. These alkaloids are divided into two distinct chemical classes, phenanthrenes and isoquinolines. The principal phenanthrenes are morphine, codeine, and thebaine, while the isoquinolines have no significant central nervous system effects and are not regulated under the CSA.

2. **Morphine**
   
   a. Morphine is the principal constituent of opium and ranges in concentration from 4 to 21 percent. Commercial opium is standardized to contain 10-percent morphine. In the United States, a small percentage of the morphine obtained from opium is used directly (about 20 tons); the remaining is converted to codeine and other derivatives (about 110 tons). Morphine is one of the most effective drugs known for the relief of severe pain and remains the standard against which new analgesics are measured. Like most narcotics, the use of morphine has increased significantly in recent years. Since 1998, there has been about a two-fold increase in the use of morphine products in the United States.
   
   b. Morphine is marketed under generic and brand name products including MS-Contin™, Oramorph SR™, MSIR™, Roxanol™, Kadian™, and RMS™. Morphine is used parenterally (by injection) for preoperative sedation, as a supplement to anesthesia, and for analgesia. It is the drug of choice for relieving the pain of myocardial infarction and for its cardiovascular effects in the treatment of acute pulmonary edema. Traditionally, morphine was almost exclusively used by injection. Today, morphine is marketed in a variety of forms, including oral solutions, immediate and sustained-release tablets and capsules, suppositories, and injectable preparations. In addition, the availability of high-concentration morphine preparations (i.e., 20-mg/ml oral solutions, 25-mg/ml injectable solutions, and 200-mg sustained-release tablets) partially reflects the use of this substance for chronic pain management in opiate-tolerant patients.

3. **Codeine**
   
   a. Codeine is the most widely used, naturally occurring narcotic in medical treatment in the world. This alkaloid is found in opium in concentrations
ranging from 0.7 to 2.5 percent. However, most codeine used in the United States is produced from morphine. Codeine is also the starting material for the production of two other narcotics, dihydrocodeine and hydrocodone. Codeine is medically prescribed for the relief of moderate pain and cough suppression.

b. Compared to morphine, codeine produces less analgesia, sedation, and respiratory depression, and is usually taken orally. It is made into tablets either alone (Schedule II) or in combination with aspirin or acetaminophen (i.e., Tylenol with Codeine™, Schedule III). As a cough suppressant, codeine is found in a number of liquid preparations (these products are in Schedule V). Codeine is also used to a lesser extent as an injectable solution for the treatment of pain. Codeine products are diverted from legitimate sources and are encountered on the illicit market.

i. Codeine tablets are generally reported as schedule III by the laboratory.

4. **Thebaine**

a. Thebaine, a minor constituent of opium, is controlled in Schedule II of the CSA as well as under international law. Although chemically similar to both morphine and codeine, thebaine produces stimulatory rather than depressant effects. Thebaine is not used therapeutically, but is converted into a variety of substances including oxycodone, oxymorphone, nalbuphine, naloxone, naltrexone, and buprenorphine. The United States ranks first in the world in thebaine utilization.

J. The following narcotics are among the more significant substances that have been derived from morphine, codeine, or thebaine contained in opium.

1. **Heroin**

a. First synthesized from morphine in 1874, heroin was not extensively used in medicine until the early 1900s. Commercial production of the new pain remedy was first started in 1898. It initially received widespread acceptance from the medical profession, and physicians remained unaware of its addiction potential for years. The first comprehensive control of heroin occurred with the Harrison Narcotic Act of 1914. Today, heroin is an illicit substance having no medical utility in the United States. It is in Schedule I of the CSA.

b. Four foreign source areas produce the heroin available in the United States: South America (Colombia), Mexico, Southeast Asia (principally Burma), and Southwest Asia (principally Afghanistan). However, South America and Mexico supply most of the illicit heroin marketed in the United States. South American heroin is a high-purity powder primarily distributed to metropolitan areas on the East Coast. Heroin powder may vary in color from white to dark brown because of impurities left from the manufacturing process or the presence of additives. Mexican heroin, known as "black tar," is primarily available in the western United States. The color and consistency of black tar heroin result from the crude processing methods used to illicitly manufacture heroin in Mexico. Black tar heroin may be sticky like roofing tar or hard like coal, and its color may vary from dark brown to black.

c. Pure heroin is rarely sold on the street. A "bag" (slang for a small unit of heroin sold on the street) currently contains about 30 to 50 milligrams of
powder, only a portion of which is heroin. The remainder could be sugar, starch, acetaminophen, procaine, benzocaine, or quinine, or any of numerous cutting agents for heroin. Traditionally, the purity of heroin in a bag ranged from 1 to 10 percent. More recently, heroin purity has ranged from about 10 to 70 percent. Black tar heroin is often sold in chunks weighing about an ounce. Its purity is generally less than South American heroin and it is most frequently smoked, or dissolved, diluted, and injected.

d. In the past, heroin in the United States was almost always injected, because this is the most practical and efficient way to administer low-purity heroin. However, the recent availability of higher purity heroin at relatively low cost has meant that a larger percentage of today's users are either snorting or smoking heroin, instead of injecting it. This trend was first captured in the 1999 National Household Survey on Drug Abuse, which revealed that 60 to 70 percent of people who used heroin for the first time from 1996 to 1998 never injected it. This trend has continued. Snorting or smoking heroin is more appealing to new users because it eliminates both the fear of acquiring syringe-borne diseases, such as HIV and hepatitis, as well as eliminating the social stigma attached to intravenous heroin use. Many new users of heroin mistakenly believe that smoking or snorting heroin is a safe technique for avoiding addiction. However, both the smoking and the snorting of heroin are directly linked to high incidences of dependence and addiction.

e. According to the 2003 National Survey on Drug Use and Health, during the latter half of the 1990s, heroin initiation rates rose to a level not reached since the 1970s. In 1974, there were an estimated 246,000 heroin initiates. Between 1988 and 1994, the annual number of new users ranged from 28,000 to 80,000. Between 1995 and 2001, the number of new heroin users was consistently greater than 100,000. Overall, approximately 3.7 million Americans reported using heroin at least once in their lifetime.

2. **Hydromorphone**

a. Hydromorphone (Dilaudid™) is marketed in tablets (2, 4, and 8 mg), suppositories, oral solutions, and injectable formulations. All products are in Schedule II of the CSA. Its analgesic potency is from two to eight times that of morphine, but it is shorter acting and produces more sedation than morphine. Much sought after by narcotic addicts, hydromorphone is usually obtained by the abuser through fraudulent prescriptions or theft. The tablets are often dissolved and injected as a substitute for heroin. In September 2004 the FDA approved the use of Palladone™ (hydromorphone hydrochloride) for the management of persistent pain. This extended-release formulation could have the same risk of abuse as OxyContin™.

3. **Oxycodone**

a. Oxycodone is synthesized from thebaine. Like morphine and hydromorphone, oxycodone is used as an analgesic. It is effective orally and is marketed alone in 10, 20, 40, 80, and 160 mg controlled-release tablets (OxyContin™), or 5 mg immediate-release capsules (OxyIR™), or in combination products with aspirin (Percodan™) or acetaminophen (Percocet™) for the relief of pain. All oxycodone products are in Schedule II. Oxycodone is abused orally, or the tablets are crushed and sniffed or dissolved in water and injected. The use of oxycodone has increased significantly. In 1993, about 3.5 tons of oxycodone were manufactured for sale in the United States. In 2003, about 41 tons were manufactured.
Historically, oxycodone products have been popular drugs of abuse among the narcotic abusing population. In recent years, concern has grown among federal, state, and local officials about the dramatic increase in the illicit availability and abuse of OxyContin™ products. These products contain large amounts of oxycodone (10 to 160 mg) in a formulation intended for slow release over a 12-hour period.

Abusers have learned that this slow-release mechanism can be easily circumvented by crushing the tablet and swallowing, snorting, or injecting the drug product for a more rapid and intense high. The criminal activity associated with illicitly obtaining and distributing this drug, as well as serious consequences of illicit use, including addiction and fatal overdose deaths, are of epidemic proportions in some areas of the United States.

4. Hydrocodone

a. Hydrocodone is structurally related to codeine but more closely related to morphine in its pharmacological profile. As a drug of abuse, it is equivalent to morphine with respect to subjective effects, opiate signs and symptoms, and "liking" scores. Hydrocodone is an effective cough suppressant and analgesic.

It is most frequently prescribed in combination with acetaminophen (i.e., Vicodin™, Lortab™) but is also marketed in products with aspirin (Lortab ASA™), ibuprofen (Vicoprofen™) and antihistamines (Hycomine™). The Drug Enforcement Administration (DEA) issued a final rule rescheduling hydrocodone combination products (HCPs) into Controlled Substance Schedule II, effective October 6, 2014. Dihydrocodeinone is listed as schedule III in the California H&S Code.

b. Hydrocodone is the most prescribed opioid in the United States, including 137 million prescriptions in 2013. Despite their obvious utility in medical practice, hydrocodone products are among the most popular pharmaceutical drugs associated with drug diversion, trafficking, abuse, and addiction. In every geographical area in the country, the DEA has listed this drug as one of the most commonly diverted. Hydrocodone is the most frequently encountered opiate pharmaceutical in submissions of drug evidence to federal, state, and local forensic laboratories. Law enforcement has documented the diversion of millions of dosage units of hydrocodone by theft, doctor shopping, fraudulent prescriptions, bogus "call-in" prescriptions, and diversion by registrants and Internet fraud.

c. Hydrocodone products are associated with significant drug abuse. According to the Drug Abuse Warning Network (DAWN), an estimated 82,480 emergency department (ED) visits were associated with nonmedical use of hydrocodone in 2011. This number of ED visits represents a 107% significant increase from the number of ED visits reported in 2004 (39,846).

K. In contrast to the pharmaceutical products derived from opium, synthetic narcotics are produced entirely within the laboratory. The continuing search for products that retain the analgesic properties of morphine without the consequent dangers of tolerance and dependence has yet to yield a product that is not susceptible to abuse. A number of clandestinely produced drugs, as well as drugs that have accepted medical uses, fall within this category.

1. Meperidine
a. Introduced as an analgesic in the 1930s, meperidine produces effects that are similar, but not identical, to morphine (shorter duration of action and reduced antitussive and antidiarrheal actions). Currently it is used for pre-anesthesia and the relief of moderate to severe pain, particularly in obstetrics and post-operative situations. Meperidine is available in tablets, syrups, and injectable forms under generic and brand name (Demerol™, Mepergan™, etc.) Schedule II preparations. Several analogues of meperidine have been clandestinely produced. During the clandestine synthesis of the analogue MPPP, a neurotoxic by-product (MPTP) was produced. A number of individuals who consumed the MPPP-MPTP preparation developed an irreversible Parkinsonian-like syndrome. It was later found that MPTP destroys the same neurons as those damaged in Parkinsons Disease.

2. **Dextropropoxyphene**
   a. A close relative of methadone, dextropropoxyphene was first marketed in 1957 under the trade name of Darvon™. Oral analgesic potency is one-half to one-third that of codeine, with 65 mg approximately equivalent to about 600 mg of aspirin. Dextropropoxyphene is prescribed for relief of mild to moderate pain. Bulk dextropropoxyphene is in Schedule II, while preparations containing it are in Schedule IV. More than 150 tons of dextropropoxyphene are produced in the United States annually, and more than 25 million prescriptions are written for the products. This narcotic is associated with a number of toxic side effects and is among the top 10 drugs reported by medical examiners in drug abuse deaths.

3. **Fentanyl**
   a. First synthesized in Belgium in the late 1950s, fentanyl, with an analgesic potency of about 80 times that of morphine, was introduced into medical practice in the 1960s as an intravenous anesthetic under the trade name of Sublimaze™. Thereafter, two other fentanyl analogues were introduced: alfentanil (Alfenta™), an ultra-short (5-10 minutes) acting analgesic, and sufentanil (Sufenta™), an exceptionally potent analgesic (5 to 10 times more potent than fentanyl) for use in heart surgery.

   b. Today, fentanyls are extensively used for anesthesia and analgesia. Duragesic™, for example, is a fentanyl transdermal patch used in chronic pain management, and Actiq™ is a solid formulation of fentanyl citrate on a stick that dissolves slowly in the mouth for transmucosal absorption. Actiq™ is intended for opiate-tolerant individuals and is effective in treating breakthrough pain in cancer patients. Carfentanil (Wildnil™) is an analogue of fentanyl with an analgesic potency 10,000 times that of morphine and is used in veterinary practice to immobilize certain large animals. Illicit use of pharmaceutical fentanyls first appeared in the mid-1970s in the medical community and continues to be a problem in the United States.

   c. To date, over 12 different analogues of fentanyl have been produced clandestinely and identified in the U.S. drug traffic. The biological effects of the fentanyls are indistinguishable from those of heroin, with the exception that the fentanyls may be hundreds of times more potent. Fentanyls are most commonly used by intravenous administration, but like heroin, they may also be smoked or snorted.

4. **Pentazocine**
a. The effort to find an effective analgesic with less dependence-producing consequences led to the development of pentazocine (Talwin™). Introduced as an analgesic in 1967, it was frequently encountered in the illicit trade, usually in combination with tripelennamine and placed into Schedule IV of the CSA in 1979. An attempt at reducing the abuse of this drug was made with the introduction of Talwin Nx™. This product contains a quantity of antagonist (naloxone) sufficient to counteract the morphine-like effects of pentazocine if the tablets are dissolved and injected.

5. Butorphanol

a. While butorphanol can be made from thebaine, it is usually manufactured synthetically. It was initially available in injectable formulations for human (Stadol™) and veterinary (Torbugesic™ and Torbutrol™) use. More recently, a nasal spray (Stadol NS™) became available, and significant diversion and abuse of this product led to the 1997 control of butorphanol in Schedule IV of the CSA. Butorphanol is a clear example of a drug gaining favor as a drug of abuse only after it became available in a form that facilitated greater ease of administration (nasal spray vs. injection).

L. Narcotics Treatment

1. Methadone

a. German scientists synthesized methadone during World War II because of a shortage of morphine. Although chemically unlike morphine or heroin, methadone produces many of the same effects. It was introduced into the United States in 1947 as an analgesic (Dolophine™). Today, methadone is primarily used for the treatment of narcotic addiction, although a growing number of prescriptions are being written for chronic pain management. It is available in oral solutions, tablets, and injectable Schedule II formulations.

b. Methadone's effects can last up to 24 hours, thereby permitting once-a-day oral administration in heroin detoxification and maintenance programs. High-dose methadone can block the effects of heroin, thereby discouraging the continued use of heroin by addicts in treatment. Chronic administration of methadone results in the development of tolerance and dependence. The withdrawal syndrome develops more slowly and is less severe, but more prolonged than that associated with heroin withdrawal. Ironically, methadone used to control narcotic addiction is encountered on the illicit market. Recent increases in the use of methadone for pain management have been associated with increasing numbers of overdose deaths.

2. LAAM

a. Closely related to methadone, the synthetic compound levo alphacetylmethadol, or LAAM (ORLMM™), has an even longer duration of action (from 48 to 72 hours) than methadone, permitting a reduction in frequency of use. In 1994, it was approved as a Schedule II treatment drug for narcotic addiction. Both methadone and LAAM have high abuse potential. Their acceptability as narcotic treatment drugs is predicated upon their ability to substitute for heroin, the long duration of action, and their mode of oral administration. Recent data regarding cardiovascular toxicity of LAAM has limited the use of this drug as a first-line therapy for addiction treatment.

3. Buprenorphine
a. This drug is a semi-synthetic narcotic derived from thebaine. Buprenorphine was initially marketed in the United States as an analgesic (Buprenex™). In 2002, two new products (Suboxone™ and Subutex™) were approved for the treatment of narcotic addiction. Like methadone and LAAM, buprenorphine is potent (30 to 50 times the analgesic potency of morphine), has a long duration of action, and does not need to be injected. Unlike the other treatment drugs, buprenorphine produces far less respiratory depression and is thought to be safer in overdose. Federally, all buprenorphine products are currently in Schedule III of the CSA. In California, buprenorphine is schedule V.

II. Analysis.
A. This section on Opiates will not be limited to the analysis of Heroin; analysis will be illustrated for a wide variety of Opiates that may be encountered in both illicit and pharmaceutical form.

B. Presumptive Tests

1. For reagent recipes see DRG.13 - Reagent Preparation.

2. There are three primary color tests that are used in screening for the wide variety of Opiates that may be encountered. The first presumptive screening test performed is the Marquis color test. Marquis reagent will form a purple color in the presence of an Opiate. Mecke's reagent, the second color test, will form a green or blue color with Opiates; although there are exceptions. The third color test, Froehde's, will produce a range of colors depending on the Opiate(s) present.

3. Codeine syrups generally contain non-narcotic ingredients that may react with Marquis, Mecke and Froehde. Common substances include promethazine and guaifenesin.

4. Nitric acid may be used. In the presence of Opiates, nitric acid will produce a yellow, orange or negative color reaction. Two other color tests, modified Cobalt Thiocyanate and Chens, will give a positive reaction with selected Opiates. It is recommended to do Modified Cobalt Thiocyanate to check for cocaine in samples that may have opiates and cocaine mixed together.

   a. Marquis Procedure: Add a toothpick full of questioned powder to one drop of the test reagent. The formation of a purple color is indicative of an opiate. Indicate the color formed.

   b. Mecke's Procedure: Add a toothpick full of questioned powder to one drop of test reagent. Generally blue and green colors form with Opiates, however, there are exceptions. Indicate the color formed.

   c. Froehde Procedure: Add a toothpick full of questioned powder to one drop of test reagent. Purple, green and yellow colors form with Opiates, although there are exceptions. Indicate the color formed.

   d. Nitric Acid Procedure: Add a toothpick full of questioned powder to one drop of test reagent. In general, orange and yellow colors will form with Opiates. Indicate the color formed.

C. Confirmatory Analysis

1. The GC/MS can be used to confirm Opiates. The recommended procedure for running a sample is as follows:

   a. Solvent Extraction

      i. Take a small quantity of the powder or liquid to be analyzed.

      ii. Extract out with methanol or suitable solvent based on the analyte characteristics and solubility information.

      iii. It should be noted that methanol is not a suitable solvent if it is suspected that water is present in the sample. If it is suspected that water is present in the sample then a chloroform extract should be used.
iv. For liquid samples suspected of containing morphine, a basic chloroform extract should be performed as some morphine salts are not soluble in CHCl$_3$.

v. Add a suitable internal standard, n-Tricosane is commonly used as an internal standard

b. Analysis

i. The commonly used methods on the GC/MS are GEN.m, dea.m, and opiate.m (it should be noted that opiate.m should only be used after a positive screening test, GEN.m should be used for an unknown or if it is suspected to also contain an early eluting compound such as methamphetamine). Buprenorphine must be run on a longer, high temperature method such as GEN.m or steroid.m.

ii. As a routine, 1 µl is injected on the GC/MS

iii. Always inject a blank solvent containing the internal standard before injecting the unknown sample onto the GC/MS (n-Tricosane is commonly used).

iv. On occasion the samples may be weak such that the molecular ion of the drug is not detected. Such samples need to be concentrated to be identified. More of the sample may need to be extracted, or a larger volume of sample may need to be injected on the GC/MS.

v. The GC/MS data is in PowerDMS.

c. **Note:** Opium samples can be identified using GC/MS if at least three major alkaloids, Morphine, Codeine and Thebaine are confirmed. Papaverine may or may not be detectable in all samples.

2. Infrared Spectroscopy (FTIR) is a means of positively identifying a sample. The major drawback is that the sample must be almost completely free of any diluents or must be readily cleaned-up. This clean-up can take the form of a solvent extraction.

3. As stated above, opiates may come in pharmaceutical form. The products found with the pharmaceutical form of opiates can affect which schedule the drug is categorized. These additional products may also dictate which extraction method and instrument method is necessary to identify relevant chromatography peaks and ion spectra.

a. For example, hydrocodone is categorized as Schedule II in the California H&S Code. However, dihydrocodeinone (also known as hydrocodone) combined with a "nonnarcotic ingredient in recognized therapeutic amounts" (e.g. acetaminophen) is categorized as Schedule III in the California H&S Code. Under these circumstances, an analyst must carefully choose the extraction method and instrument method to analyze for the nonnarcotic or other pharmaceutical products accompanying the opiate. When reporting, consideration must be made for the correct drug and schedule that will be reported, along with the data documentation (both for the narcotic and nonnarcotic findings) to support the findings.

### III. Policy: Study Topics for the Analyst to Review with the Trainer.

A. The trainer may review the study topics with the analyst in a written or oral format. The trainer should document that the review has occurred.

1. List the opiate compounds needed to identify a suspected opium submission.
2. What is the chemical name for Heroin?
3. Define and give examples for each of the following terms:
   a. natural opiates
   b. semi-synthetic opioids
c. synthetic opioids

4. What schedule is codeine pill when it contains a non-narcotic analgesic?

5. Give examples of the legitimate administration of opiates.

6. Describe how you would extract and confirm a brown aqueous solution with the following color test results:
   a. Marquis - Purple
   b. Mecke - Green
   c. Froehde - Purple

</table>

<table>
<thead>
<tr>
<th>CHAPTER: Phencyclidine (PCP), analogs and Dissociative Anesthetics</th>
<th>SUBJECT: Analysis of PCP</th>
</tr>
</thead>
</table>

### I. Policy:
Below is general information regarding Phencyclidine (PCP), analogs and Dissociative Anesthetics.

#### A. Phencyclidine

#### B. Ketamine

#### C. In the 1950s, phencyclidine (PCP) was investigated as an anesthetic but, due to the side effects of confusion and delirium, its development for human use was discontinued. It became commercially available for use as a veterinary anesthetic in the 1960s under the trade name of Sernylan™ and was placed in Schedule III of the CSA. In 1978, due to considerable abuse, phencyclidine was transferred to Schedule II of the CSA and manufacturing of Sernylan™ was discontinued. Today, virtually all of the phencyclidine encountered on the illicit market in the United States is produced in clandestine laboratories.

#### D. PCP is illicitly marketed under a number of other names, including Angel Dust, Supergrass, Killer Weed, Embalming Fluid, and Rocket Fuel, reflecting the range of its bizarre and volatile effects. In its pure form, it is a white crystalline powder that readily dissolves in water. However, most PCP on the illicit market contains a number of
contaminants as a result of makeshift manufacturing, causing the color to range from tan to brown, and the consistency from powder to a gummy mass. Although sold in tablets and capsules as well as in powder and liquid form, it is commonly applied to a leafy material, such as parsley, mint, oregano, or marijuana, and smoked.

E. The drug's effects are as varied as its appearance. A moderate amount of PCP often causes the user to feel detached, distant, and estranged from his surroundings. Numbness, slurred speech, and loss of coordination may be accompanied by a sense of strength and invulnerability. A blank stare, rapid and involuntary eye movements, and an exaggerated gait are among the more observable effects. Auditory hallucinations, image distortion, severe mood disorders, and amnesia may also occur. In some users, PCP may cause acute anxiety and a feeling of impending doom; in others, paranoia and violent hostility; and in some, it may produce a psychosis indistinguishable from schizophrenia. PCP use is associated with a number of risks, and many believe it to be one of the most dangerous drugs of abuse.

F. Modification of the manufacturing process may yield chemically related analogues capable of producing psychic effects similar to PCP. Four of these substances have been encountered on the illicit market and have been placed in Schedule I of the CSA:

1. N-ethyl-l-phenylcyclohexylamine or PCE
2. l-(phenylcyclohexyl)pyrrolidine or PCPy
3. l-[l-(2-thienyl)cyclohexyl]piperdine or TCP
4. and l-[l-(2-thienyl)cyclohexyl]pyrrolidine or TCPy

G. Telazol™, a Schedule III veterinary anesthetic containing tiletamine (a PCP analogue), in combination with zolazepam, (a benzodiazepine), is sporadically encountered as a drug of abuse.

H. Phencyclidine, or PCP (1-(1-Phenylcyclohexyl)piperidine), listed by some as an analgesic or anesthetic, is a potent compound that is normally ingested for its hallucinogenic properties. It is not encountered often in this laboratory, although in Santa Clara County it is one of the most popular drugs of abuse.

I. Phencyclidine also has many analogs and structurally related compounds that are both controlled and non-controlled. It is therefore essential to be able to identify and distinguish PCP and its controlled analogs not only from each other, but also from the non-controlled analogs.

J. Ketamine is a rapidly acting general anesthetic. Its pharmacological profile is essentially the same as phencyclidine. Like PCP, ketamine is referred to as a dissociative anesthetic because patients feel detached or disconnected from their pain and environment when anesthetized with this drug. Unlike most anesthetics, ketamine produces only mild respiratory depression and appears to stimulate, not depress, the cardiovascular system. In addition, ketamine has both analgesic and amnesic properties and is associated with less confusion, irrationality, and violent behavior than PCP. Use of ketamine as a general anesthetic for humans has been limited due to adverse effects including delirium and hallucinations. Today, it is primarily used in veterinary medicine, but has some utility for emergency surgery in humans.

K. Although ketamine has been marketed in the United States for many years, it was only recently associated with significant diversion and abuse and placed in Schedule III of the CSA in 1999. Known in the drug culture as "Special K" or "Super K," ketamine has become a staple at dance parties or "raves." Ketamine is supplied to the illicit market by the diversion of legitimate pharmaceuticals (Ketasert™, Ketalar™). It is usually distributed
as a powder obtained by removing the liquid from the pharmaceutical products. As a drug of abuse, ketamine can be administered orally, snorted, or injected. It is also sprinkled on marijuana or tobacco and smoked. After oral or intranasal administration, effects are evident in about 10 to 15 minutes and are over in about an hour.

L. After intravenous use, effects begin almost immediately and reach peak effects within minutes. Ketamine can act as a depressant or a psychedelic. Low doses produce vertigo, ataxia, slurred speech, slow reaction time, and euphoria. Intermediate doses produce disorganized thinking, altered body image, and a feeling of unreality with vivid visual hallucinations. High doses produce analgesia, amnesia, and coma.

M. This is an outline of the techniques presently in use at this laboratory. The tests and their implications are discussed. For specific instruction on technique, refer to the individual sections of the manual.

II. Policy: Below is information regarding screening PCP.

Assorted PCP Samples

Ketamine

Ketamine powder (above) is clandestinely sold at "rave" parties and is usually snorted.
A. Presumptive Tests

1. The Modified Cobalt Thiocyanate (M-COSCN) test is the primary color test used for the screening of PCP and its analogs. PCP and most of its analogs will produce a positive blue reaction with the reagent. Unfortunately, it is the same reaction produced by Cocaine, both in the base and salt forms, and numerous other compounds.

   a. Cobalt Thiocyanate (Modified):

      i. Reagents: Mix by volume: 9 parts a with 3 parts b with 1 part c
         1. 2% solution of cobaltous thiocyanate in water
         2. phosphoric acid
         3. 1 gram of platinum chloride in 20ml phosphoric acid

      ii. Procedure: Add a toothpick of the questioned material to one drop of the reagent. The production of a robin's egg blue color is a positive test

      iii. Indicate the color formed

<table>
<thead>
<tr>
<th>Compound</th>
<th>M-COSCN</th>
</tr>
</thead>
<tbody>
<tr>
<td>PCP [1-(1-phenylcyclohexyl) piperidine]</td>
<td>positive</td>
</tr>
<tr>
<td>PCC [1-peperodinocyclohexanecarbonitrile]</td>
<td>positive</td>
</tr>
<tr>
<td>PCP-4-Hydroxy analog</td>
<td>positive</td>
</tr>
<tr>
<td>n,n-Diethyl-1-Phencyclohexamine</td>
<td>positive</td>
</tr>
<tr>
<td>Ketamine</td>
<td>negative</td>
</tr>
<tr>
<td>TCP [1-(1-(2-thienyl) cyclohexyl) piperidine]</td>
<td>positive</td>
</tr>
</tbody>
</table>

2. Note: Production of a robin's egg blue was a positive reaction. Ketamine may have a weak reaction or particles that turn blue.

3. A negative test is the production of no color; formation of any other color produced should be noted.

III. Policy: Below is information regarding confirmation of PCP.

A. The GC/MS can be used to confirm Phencyclidine (PCP) and its Analogs. The commonly used methods on the GC/MS is GEN.m or dea.m (Use GEN.m for an unknown). The recommended procedure for running a sample is as follows:

   1. Solvent Extraction

      a. Take a small quantity of the powder or liquid to be analyzed.

      b. Extract out with methanol or suitable solvent based on the analyte characteristics and solubility information.

      c. It should be noted that methanol is not a suitable solvent if it is suspected that water is present in the sample. If it is suspected that water is present in the
sample then an acid/basic chloroform extract should be used.

d. Add a suitable internal standard, n-Tricosane is commonly used as an internal standard

2. Analysis

a. The commonly used methods on the GC/MS is GEn.m, or dea.m
b. As a routine, 1 µl is injected on the GC/MS
c. Always inject a blank solvent containing the internal standard before injecting the unknown sample onto the GC/MS
d. On occasion the samples may be weak. Such samples need to be concentrated to be identified. More of the sample may need to be extracted, or a larger volume of sample may need to be injected on the GC/MS
e. The GC/MS data is in the GC/MS data section of the binder.

3. GC/MS Data of Retention Times/Relative Retention Times

<table>
<thead>
<tr>
<th>Compound</th>
<th>Retention Time</th>
<th>Relative Retention Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>PCP</td>
<td>8.21</td>
<td>0.83</td>
</tr>
<tr>
<td>PCC</td>
<td>6.29</td>
<td>0.63</td>
</tr>
<tr>
<td>Ketamine</td>
<td>7.93</td>
<td>0.80</td>
</tr>
</tbody>
</table>

a. Note: Retention times may vary based on the concentration of the compound injected on the GC/MS. Generally, highly concentrated samples have slightly increased retention times.

B. Infrared spectroscopy is a means of positively identifying a substance. However, PCP and its analogs may not be encountered in a pure enough state to allow infrared analysis without a sample clean up. IR is a very good procedure for PCC confirmation. PCC exists in a relatively pure form due to its method of manufacture.

IV. Policy: Study Topics for the analyst to review with the Trainer.

A. The trainer may review the study topics with the analyst in a written or oral format. The trainer should document that the review has occurred.

1. What is the color reaction of PCP with cobalt thiocyanate?
2. What drug class does PCP and Ketamine fall under?
3. What is the chemical name for PCP and PCC?
4. PCP and Ketamine are schedule II controlled substances, what, if any, are the legitimate uses for these drugs.

I. Policy: Below is general information regarding Phenethylamines.

A. Methamphetamine

\[
\text{C}_{10}\text{H}_{15}\text{N}, \text{MW}=149
\]

B. Amphetamine

\[
\text{C}_{9}\text{H}_{13}\text{N}, \text{MW}=135
\]

C. Enhancements:

PC 1203.073b2: Two ounces (of substance containing Methamphetamine) or ounce of pure Methamphetamine.

H&S 11370.4b1: Penalty enhancements for substances containing 1 kilogram

H&S 11370.4b2: Penalty enhancements for substances containing 4 kilograms

H&S 11370.4a3: Penalty enhancements for substances containing 10 kilograms

H&S 11370.4a4: Penalty enhancements for substances containing 20 kilograms

H&S 11379.8: if 11379.6 >44 lbs/105 gal

D. Methamphetamine and Amphetamine are the two most common controlled drugs of the Phenethylamine class that are encountered in this laboratory.

1. Amphetamine, dextroamphetamine, methamphetamine, and their various salts, are collectively referred to as amphetamines. In fact, their chemical properties and actions are so similar that even experienced users have difficulty knowing which drug they have taken.

2. Amphetamine was first marketed in the 1930s as Benzedrine™ in an over-the-counter inhaler to treat nasal congestion. By 1937, amphetamine was available by prescription in tablet form and was used in the treatment of the sleeping disorder, narcolepsy, and the behavioral syndrome called minimal brain dysfunction, which today is called attention deficit hyperactivity disorder (ADHD). During World War II, amphetamine was widely used to keep the fighting men going and both dextroamphetamine (Dexedrine™) and methamphetamine (Methedrine™) were readily available.

3. As use of amphetamines spread, so did their abuse. In the 1960s, amphetamines became a perceived remedy for helping truckers to complete their long routes without falling asleep, for weight control, for helping athletes to perform better and train longer, and for treating mild depression. Intravenous amphetamines, primarily methamphetamine, were abused by a subculture known as "speed freaks." With experience, it became evident that the dangers of abuse of these drugs outweighed most of their therapeutic uses.
4. Increased control measures were initiated in 1965 with amendments to the federal food and drug laws to curb the black market in amphetamines. Many pharmaceutical amphetamine products were removed from the market including all injectable formulations, and doctors prescribed those that remained less freely. Recent increases in medical use of these drugs can be attributed to their use in the treatment of ADHD. Amphetamine products presently marketed include generic and brand name amphetamine (Adderall™, Dextedrine™, Dextrostat™) and brand name methamphetamine (Desoxyn™). Amphetamines are all controlled in Schedule II of the CSA.

5. To meet the ever-increasing black market demand for amphetamines, clandestine laboratory production has mushroomed. Today, most amphetamines distributed to the black market are produced in clandestine laboratories. Methamphetamine laboratories are, by far, the most frequently encountered clandestine laboratories in the United States. The ease of clandestine synthesis, combined with tremendous profits, has resulted in significant availability of illicit methamphetamine, especially on the West Coast, where abuse of this drug has increased dramatically in recent years. Large amounts of methamphetamine are also illicitly smuggled into the United States from Mexico.

6. Amphetamines are generally taken orally or injected. However, the addition of "ice," the slang name for crystallized methamphetamine hydrochloride, has promoted smoking as another mode of administration. Just as "crack" is smokable cocaine, "ice" is smokable methamphetamine. Methamphetamine, in all its forms, is highly addictive and toxic.

7. The effects of amphetamines, especially methamphetamine, are similar to cocaine, but their onset is slower and their duration is longer. In contrast to cocaine, which is quickly removed from the brain and is almost completely metabolized, methamphetamine remains in the central nervous system longer, and a larger percentage of the drug remains unchanged in the body, producing prolonged stimulant effects. Chronic abuse produces a psychosis that resembles schizophrenia and is characterized by paranoia, picking at the skin, preoccupation with one's own thoughts, and auditory and visual hallucinations. These psychotic symptoms can persist for months and even years after use of these drugs has ceased and may be related to their neurotoxic effects. Violent and erratic behavior is frequently seen among chronic abusers of amphetamines, especially methamphetamine.

E. Methcathinone, known on the streets as "Cat," is a structural analogue of methamphetamine and cathinone. Clandestinely manufactured, methcathinone is almost exclusively sold in the stable and highly water soluble hydrochloride salt form. It is most commonly snorted, although it can be taken orally by mixing it with a beverage or diluted in water and injected intravenously. Methcathinone has an abuse potential equivalent to methamphetamine and produces amphetamine-like effects. It was placed in Schedule I of the Federal CSA in 1993.

F. Methylphenidate, a Schedule II substance, has a high potential for abuse and produces many of the same effects as cocaine and the amphetamines. The abuse of this substance has been documented among narcotic addicts who dissolve the tablets in water and inject the mixture. Complications arising from this practice are common due to the insoluble fillers used in the tablets. When injected, these materials block small blood vessels, causing serious damage to the lungs and retina of the eye. Binge use, psychotic episodes, cardiovascular complications, and severe psychological addiction have all been associated with methylphenidate abuse.

1. Methylphenidate is used legitimately in the treatment of excessive daytime sleepiness associated with narcolepsy, as is the newly marketed Schedule IV stimulant, modafinil (Provigil™). However, the primary legitimate medical use of methylphenidate (Ritalin™, Methylin™, Concerta™) is to treat attention deficit hyperactivity disorder (ADHD) in children. The increased use of this substance for the treatment of ADHD has paralleled an increase in its abuse among adolescents and young adults who crush these tablets and snort the powder to get high. Abusers have little difficulty obtaining methylphenidate from classmates or friends who have been prescribed it.

G. A number of drugs have been developed and marketed to replace amphetamines as appetite suppressants. These anorectic drugs include benzphetamine (Didrex™), diethylpropion (Tenuate™, Tepani™), mazindol (Sanorex™, Mazanor™), phendimetrazine (Bontril™, Prelu-27™), and phentermine (Lonamin™, Fastin™, Adipex™). These substances are in Schedule III or IV of the CSA and produce some amphetamine-like effects. Of these diet pills, phentermine is the most widely prescribed and most frequently encountered on the illicit market. Two Schedule IV anorectics often used in combination with phentermine, fenfluramine and dexfenfluramine, were removed from the U.S. market because they were associated with heart valve problems.

H. For centuries, khat, the fresh young leaves of the Catha edulis shrub, has been consumed where the plant is cultivated, primarily East Africa and the Arabian Peninsula. There, chewing khat predates the use of coffee and is used in a similar social context. Chewed in moderation, khat alleviates fatigue and reduces appetite. Compulsive use may result in manic behavior with grandiose delusions or in a paranoid type of illness,
sometimes accompanied by hallucinations. Khat has been smuggled into the United States and other countries from the source countries for use by emigrants. It contains a number of chemicals, among which are two controlled substances federally, cathinone (Schedule I) and cathine (Schedule IV). In California, cathinone is schedule II and cathine is schedule IV. As the leaves mature or dry, cathinone is converted to cathine, which significantly reduces its stimulatory properties.
METHAMPHETAMINE

**Structural Formula**

![Structural formula of methamphetamine](image)

C₈H₁₃N \[\text{Mol. Wt. 149.24}\]

**Other Names**

- N-α-Dimethylbenzeneethanamine
- N-α-Dimethylphenethylamine
- Desoxyephedrine
- N-Methylamphetamine
- 1-Phenyl-2-methylaminopropane
- Phenylisopropylmethylamine
- Desoxyn (Hydrochloride Salt)
- Methedrine (Hydrochloride Salt)
- Pervitin (Hydrochloride Salt)

Methamphetamine occurs as two optical isomers, "d" and "l", or the racemic "d, l" form. The methamphetamine of commerce was usually the "d" form. Clandestinely manufactured Methamphetamine is usually either the "d, l" or "d" form depending on the precursors used and the method of manufacture.

Of the many possible methamphetamine syntheses, only a few are frequently encountered. They are:

1. Synthesis from Phenylacetone and Methylamine using Aluminum and Mercuric Chloride.
2. Synthesis from Phenylacetone via the Leuckart method.
3. Synthesis from Ephedrine by Hydrogenation, usually via a halogenated intermediate.
4. Synthesis from Ephedrine by the Hydroiodic Acid (Red Phosphorus) method.

II. Analysis

A. Presumptive Tests

1. Color tests are presumptive tests preformed to screen samples for the presence of Phenethylamines. Presumptive tests can give the analyst some indication of the possible Phenethylamine.

2. For reagent recipes, see DRG.13 - Reagent Preparation.

3. There are three color tests that can be very useful in the identification of Phenethylamines. Two of these tests, Marquis and Rothera's (Secondary Amine), should be preformed first. An orange Marquis indicates the possible presence of a Phenethylamine. A blue Rothera's differentiates further among the types of Phenethylamine that may actually be present. Amphetamine will give an orange Marquis and a negative Rothera's, while Methamphetamine and Mephentermine are the only two common Phenethylamines that will give an orange and blue combination. Designer drug n,n-DMA will also give the same color combination.

4. A supplemental color test, Modified Cobalt Thiocyanate (COSCN), while not necessary for the identification of the type of Phenethylamine, should be performed in conjunction with Marquis and Rothera's. Occasionally a sample containing both Methamphetamine and Cocaine will be encountered; performing the modified COSCN test will quickly detect this.

   a. **Marquis** Procedure: Add a toothpick full of the questioned sample powder to one drop of reagent. An orange reaction occurs with Methamphetamine and Amphetamine. Indicate the color formed

      i. This reagent has a very short shelf-life due to the loss of formaldehyde. A new reagent should be prepared within a couple months or when the analyst has an indication that the color reaction is slower and weaker.

   b. **Rothera** (Secondary Amine Test) Procedure: Add a toothpick full of the questioned sample powder to one drop of solution 1. Add a drop of solution 2. Next add one drop of acetaldehyde
(solution 3). A bright blue color indicated a secondary amine. Indicate the color formed

c. **Modified Cobalt Thiocyanate** Procedure: Add a toothpick of the questioned material to one drop of the reagent. The production of a robin’s egg blue color is a positive test for cocaine. Indicate the color formed

B. **Confirmatory Analysis**

1. The GC/MS can be used to confirm Phenethylamines. The recommended procedure for running a sample is as follows:

   a. Solvent Extraction
      i. Take a small quantity of the powder or liquid to be analyzed.
      ii. Basify the sample (Rothera 2 is typically used)
      iii. Extract out with petroleum ether or suitable solvent (like chloroform that is not miscible with water) based on the analyte characteristics and solubility information.
      iv. There may be a "salting out" effect of Phenethylamines when extracted in methanol resulting in unacceptable chromatography (significant peak tailing), if this occurs basic petroleum ether or chloroform extract should be used.
      v. It should be noted that methanol is not a suitable solvent if it is suspected that water is present in the sample. If it is suspected that water is present in the sample then a basic chloroform (or petroleum ether) extract should be used.
      vi. Add a suitable internal standard, n-Tricosane is commonly used as an internal standard

   b. Analysis
      i. The commonly used methods on the GC/MS are GEN.m, dea.m, and meth.m. (it should be noted that the meth.m method should be used following a positive screening test; GEN.m should be used for an unknown).
      ii. As a routine, 1 µl is injected on the GC/MS
      iii. Always inject a blank solvent containing the internal standard before injecting the unknown sample onto the GC/MS (n-Tricosane is commonly used).
      iv. On occasion the samples may be weak such that the molecular ion of the drug is not detected. Such samples need to be concentrated to be identified. More of the sample may need to be extracted, or a larger volume of sample may need to be injected on the GC/MS
      v. The GC/MS data is in PowerDMS.
      vi. **Note**: Care should be taken when identifying Phenethylamines by GC/MS due to their substantially similar mass spectra. Specifically Mephentermine and Dimethylamphetamine have a very similar mass spectra as well as eluting very close to one another (see GC/MS data for comparison of spectra and relative retention time). Careful comparison of mass spectra as well as relative retention time is necessary for identification of Phenethylamines by GC/MS.
      vii. **Note**: Retention times may vary based on the concentration of the compound injected on the GC/MS. Generally, highly concentrated samples have slightly increased Retention Time.

2. Infrared Spectroscopy (FTIR) is a means of positively identifying a sample. The major drawback is that the sample must be almost completely free of any diluents or must be readily clean-up. This clean-up can take the form of a solvent extraction

### III. Policy: Study Topics for the analyst to review with the Trainer.

A. The trainer may review the study topics with the analyst in a written or oral format. The trainer should document that the review has occurred.

1. What drugs have the same color tests as Amphetamine and Methamphetamine respectively? Are these controlled?
2. What are secondary amines and what is the significance of Rothera color test in their screening?
3. What are the legitimate uses of the Amphetamine and Methamphetamine?
4. What is "ICE"
5. Why is DMSO a popular common cutter for Methamphetamine samples?
6. What is impact of "salting" on the phenethylamines Total Ion Chromatograph? How can it be mitigated?

### IV. BIBLIOGRAPHY

END OF DOCUMENT
I. Policy: Below is general information regarding Steroids.

A. Testosterone

B. Boldenone

C. Oxymetholone
D. Stanozolol

E. Anabolic steroids can promote increase in muscle mass and improved endurance. These drugs may be abused by athletes as performance enhancing drugs. These drugs are used by high school, college, professional, and elite amateur athletes in a variety of sports (e.g., weight lifting, track and field, swimming, cycling, and others) to obtain a competitive advantage. Body builders and fitness buffs take anabolic steroids to improve their physical appearance, and individuals in occupations requiring enhanced physical strength (e.g., body guards, night club bouncers, construction workers) are also known to use these drugs.

F. Concerns over a growing illicit market, abuse by teenagers, and the uncertainty of possible harmful long-term effects of steroid use, led Congress in 1991 to place anabolic steroids as a class of drugs into Schedule III of the Controlled Substances Act (CSA). The CSA defines anabolic steroids as any drug or hormonal substance chemically and pharmacologically related to testosterone (other than estrogens, progestins, and corticosteroids) that promotes muscle growth.

G. Most illicit anabolic steroids are sold at gyms, competitions, and through mail-order operations. For the most part, these substances are smuggled into the United States from many countries. The illicit market includes various preparations intended for human and veterinary use as well as bogus and counterfeit products. The most commonly encountered anabolic steroids on the illicit market include testosterone, nandrolone, methenolone, stanozolol, and methandrostanolone. Other steroids seen in the illicit market include boldenone, fluoxymesterone, methandriol, methyltestosterone, oxandrolone, oxymetholone, and trenbolone.

H. A limited number of anabolic steroids have been approved for medical and veterinary use. The primary legitimate use of these drugs in humans is for the replacement of inadequate levels of testosterone resulting from a reduction or absence of functioning testes. Other indications include anemia and breast cancer. Experimentally, anabolic steroids have been used to treat a number of disorders including AIDS wasting, erectile dysfunction, and osteoporosis. In veterinary practice, anabolic steroids are used to promote feed efficiency and to improve weight gain, vigor, and hair coat. They are also used in veterinary practice to treat anemia and counteract tissue breakdown during illness and trauma.

I. When used in combination with exercise training and a high protein diet, anabolic steroids can promote increased size and strength of muscles, improve endurance, and decrease recovery time between workouts. They are taken orally or by intramuscular injection. Users concerned about drug tolerance often take steroids on a schedule called a cycle. A cycle is a period of between 6 and 14 weeks of steroid use, followed by a period of abstinence or reduction in use. Additionally, users tend to "stack" the drugs, using multiple drugs concurrently. Although the benefits of these practices are unsubstantiated, most users feel that cycling and stacking enhance the efficiency of the drugs and limit their side effects.
J. Another mode of steroid use is called "pyramiding." With this method users slowly escalate steroid use (increasing the number of drugs used at one time and/or the dose and frequency of one or more steroids), reach a peak amount at mid-cycle and gradually taper the dose toward the end of the cycle. The escalation of steroid use can vary with different types of training. Body builders and weight lifters tend to escalate their dose to a much higher level than do long distance runners or swimmers.

K. The long-term adverse health effects of anabolic steroid use are not definitely known. There is, however, increasing concern of possible serious health problems associated with the abuse of these agents, including cardiovascular damage, cerebrovascular toxicity, and liver damage.

L. Physical side effects include elevated blood pressure and cholesterol levels, severe acne, premature balding, reduced sexual function, and testicular atrophy. In males, abnormal breast development (gynecomastia) can occur. In females, anabolic steroids have a masculinizing effect, resulting in more body hair, a deeper voice, smaller breasts, and fewer menstrual cycles. Several of these effects are irreversible. In adolescents, abuse of these agents may prematurely stop the lengthening of bones, resulting in stunted growth. For some individuals, the use of anabolic steroids may be associated with psychotic reactions, manic episodes, feelings of anger or hostility, aggression, and violent behavior.

M. A variety of non-steroid drugs are commonly found within the illicit anabolic steroid market. These substances are primarily used for one or more of the following reasons:

1. to serve as an alternative to anabolic steroids;
2. to alleviate short-term adverse effects associated with anabolic steroid use; or
3. to mask anabolic steroid use. Examples of drugs serving as alternatives to anabolic steroids include clenbuterol, human growth hormone, insulin, insulin-like growth factor, and GHB. Drugs used to prevent or treat adverse effects of anabolic steroid use include tamoxifen, diuretics, and human chorionic gonadotropin. Diuretics, probenecid, and epitestosterone may be used to mask anabolic steroid use.

N. Over the last few years, a number of precursors to either testosterone or nandrolone have been marketed as dietary supplements in the United States. Some of these substances include androstenedione, androstenediol, norandrostenedione, norandrostenediol, and dehydroepiandrosterone (DHEA). New legislation has been introduced in Congress to add several steroids to the CSA and to alter the CSA requirements needed to place new steroids under control in the CSA.

O. Presently Anabolic Steroids are classified as a Schedule III controlled substance under the California Uniform Controlled Substances Act. With the popularity of steroids increasing, criminalistic laboratories are faced with the analysis and identification of these substances.

P. Chemical Structure

1. Steroids are organic molecules whose structure is based on a tetracyclic ring system.
Q. Dosage Form

1. The majority of steroids encountered will be in basically two forms:
   a. an injectable solution or
   b. solid dosage pharmaceutical form. A high demand for anabolic steroids has created a significant underground market and sophisticated counterfeit trade. As a result, markings on dosage units are not a good indicator of the actual content.

2. The analyst must be very cautious in relying on the markings and physical appearance of a possible steroid. Many of the steroids produced have been discontinued in the U.S. market; consequently, these products are being produced outside the U.S. (i.e. Mexico, some European countries).

3. Occasionally the analyst may analyze a suspected steroid to find that it differs from what the packaging indicates or contains one of the many oils associated with injectable steroids. **Suspected steroids should always be confirmed through chemical and instrumental tests.**

Injectable Solution of Nandrolone Decanoate
R. The following is an analytical procedure for the analysis of anabolic steroids.

II. Policy: Below is information regarding screening Steroids.

A. Presumptive Color Tests

1. There are five possible color tests that can be used on a suspected steroid. The color tests include Marquis, Mecke, Froehde, Liebermann and concentrated Sulfuric Acid (H₂SO₄). The combination of these color tests can aid the analyst in differentiating between the various steroids that may be encountered.

2. Many of the steroid cases submitted are in the form of an injectable oil and/or in a tablet form. The analyst should be aware of the possibility of interference of the color reactions when dealing with injectable type steroids. However, steroids in tablet form seem to give adequate color reactions if the steroid concentration is sufficient.

a. Liebermann

   i. Reagent: 5 g sodium nitrite in 50 mL sulfuric acid

   ii. Procedure: Add a toothpick full of the questioned sample powder to one drop of reagent.
### iii. Indicate the color formed

III. Policy: Below is information regarding extraction techniques of Steroids.

A. Solid Dose Steroid Tablets: Abercrombie Method

1. Pulverize several tablets (if available) with a mortar and pestle.
2. Add approximately 2 ml of methanol, or suitable solvent depending on analyte characteristics, to the pulverized tablets in a 10 ml screw-cap glass test tube.
3. Vortex to mix thoroughly.
4. Centrifuge test tube for several minutes.
5. An aliquot is taken from the methanol layer, a suitable internal standard is added (Cholesterol is routinely used as the internal standard if steroids are suspected). Stanozolol must be analyzed ONLY with n-Tricosane as I.S.
6. Analyze by GC/MS. The steroid.m method is routinely used on the GC/MS when steroids are suspected.

B. Injectable Vegetable Oils

1. Approximately 2 ml of oil is first extracted by vigorous shaking with approximately 4 ml methanol, in a screw cap glass test tube for at least 2 minutes.
2. The methanol extract, after centrifugation, is decanted and placed in the freezer compartment of a refrigerator for 15 minutes in order to precipitate co-extracted components of the oil.
3. After 15 minutes in the freezer, the methanol solution becomes cloudy and turbid and is immediately centrifuged to remove the cold-induced precipitation.
4. A suitable internal standard is added to an aliquot of the remaining clarified supernatant. See below for selection of internal standard.
5. Analyze by GC/MS. The steroid.m method is routinely used on the GC/MS when steroids are suspected.

C. Alkaline Hydrolysis of C17-Alkyl Esters
The California Controlled Substances Act requires the identification of the anabolic steroid moiety without regard to the presence of ester linkages at the C17 position. Consequently, a convenient time-saving analytical procedure involves cleavage of any C17-ester linkage to liberate the parent steroid. Typically, injectable vegetable oils contain the anabolic steroid as an alkylated ester at the C17 position. The parent steroid is identified and reported.

1. Add approximately 2-5 pellets of Potassium Hydroxide (KOH) to approximately 2 ml of the methanol extract obtained from the procedure B (above). If the methanol congeals after the addition of the KOH, add more MeOH such that the solution is liquid.

2. Allow the hydrolysis to proceed at room temperature for 15 minutes.

3. The methanol is dried under vacuum (as dry as possible-the solution may not dry completely)

4. Dissolve the residue in 1-2 ml diethyl ether.

5. The ether solution is washed with distilled water. When the water is added, the diethyl ether will be the solution on the top of the bi-layer. The top layer should be retained.

6. The diethyl ether is dried with anhydrous Sodium sulfate (Na$_2$SO$_4$) to extract any residual water. This can be done by putting a small amount of anhydrous Sodium sulfate into a Pasteur pipette plugged with glass wool and letting the diethyl ether solution run through.

7. Evaporate the diethyl ether solution under vacuum.

8. Dissolve the residue in methanol for analysis, a suitable internal standard is added. (Cholesterol is routinely used as the internal standard if steroids are suspected)

9. Analyze by GC/MS. The steroid.m method is routinely used on the GC/MS when steroids are suspected.

IV. Policy: Below is information regarding confirmation of Steroids.

A. The GC/MS instruments are programmed with the GEN.m and steroid.m methods that are routinely used in steroid analysis after the appropriate extraction procedure is performed on the sample. The steroid.m was designed for most steroids, and the GEN.m was designed for early and late eluting compounds including steroids. See the section on Extraction Techniques.

1. It should be noted that methanol is not a suitable extraction solvent if water is suspected to be present in the sample. If it is suspected that water is present, use chloroform as an extraction solvent.

2. Cholesterol is the internal standard routinely used in the analysis of most steroids with one exception, Stanozolol. Stanozolol co-elutes with cholesterol using the steroid.m method (See the GC/MS spectral data). For this steroid n-Tricosane must be used as the internal standard. If an unknown is analyzed with n-Tricosane as internal standard, the sample does not need to be rerun with Cholesterol as internal standard.

3. Inject a blank before the sample.

B. Cholesterol Internal Standard Recipe
1. 0.1 g cholesterol
2. 2 ml methanol
3. 3 ml chloroform

C. Infrared Spectroscopy (FTIR) is a means of positively identifying a sample. The major drawback is that the sample must be almost completely free of any diluents or must be readily cleaned-up. A method of clean-up can be accomplished by a solvent extraction.

V. **Policy:**  **Study Topics for the analyst to review with the Trainer.**

A. The trainer may review the study topics with the analyst in a written or oral format. The trainer should document that the review has occurred.

1. What is the internal standard used in the GC/MS analysis for steroids?
2. Why is Cholesterol not acceptable internal standard for Stanozolol?
3. What are anabolic steroids? Why are they abused?
4. Define and differentiate between androgenic steroids and anabolic steroids.
5. What if any are the differences between the STERIOD.m vs. DEA.m GC/MS methods?
6. Why is it unacceptable to analyze steroids injections or pills by their markings and appearance?
7. If the laboratory does not have a standard for Testosterone Propionate, what extraction procedure can the analyst use to identify Testosterone?

VI. **BIBLIOGRAPHY**

H. [dea/pubs/abuse/8-hallu.htm](dea/pubs/abuse/8-hallu.htm)

I. Policy: Below is general information regarding Tryptamines.

A. There exists a fair number of naturally occurring tryptamine type compounds, which have hallucinogenic activity. The most commonly used ones are Psilocybin and closely related Psilocyn. The remaining controlled tryptamine compounds are Bufotenine, Ibogaine, Dimethyltryptamine (DMT), and Diethyltryptamine (DET).

B. A number of Schedule I hallucinogenic substances are classified chemically as tryptamines. Most of these are found in nature but many, if not all, can be produced synthetically. Psilocybin and psilocyn (4-hydroxy-N,N-dimethyltryptamine) are obtained from certain mushrooms indigenous to tropical and subtropical regions of South America, Mexico, and the United States. As pure chemicals at doses of 10 to 20 mg, these hallucinogens produce muscle relaxation, dilation of pupils, vivid visual and auditory distortions, and emotional disturbances. However, the effects produced by consuming preparations of dried or brewed mushrooms are far less predictable and largely depend on the particular mushrooms used and the age and preservation of the extract. There are many species of "magic" mushrooms that contain varying amounts of these tryptamines, as well as uncertain amounts of other chemicals. As a consequence, the hallucinogenic activity, as well as the extent of toxicity produced by various plant samples, are often unknown.

C. Psilocybin is a constituent of over 40 species of mushrooms. The species fall into five genre, headed by Psilocybe and Stropharia. The other three are Panaeolus, Conocybe, and Copelandia. The two most common mushrooms encountered are Psilocybe mexicana and Stropharia cubensis.

D. Psilocybin is present in the mushrooms at reported levels of 0.2 to 0.4%. Psilocyn is a hydrolysis product of psilocybin and occurs at trace amounts. The biogenic precursor to the psilocybin appears to be Tryptophan.

E. Dimethyltryptamine (DMT) N,N-Dimethyltryptamine has a long history of use and is found in a variety of plants and seeds. It can also be produced synthetically. It is ineffective when taken orally, unless combined with another drug that inhibits its metabolism. Generally it is sniffed, smoked, or injected. The effective hallucinogenic dose in humans is about 50 to 100 mg and lasts for about 45 to 60 minutes. Because the effects last only about an hour; the experience has been referred to as a "businessman's trip."

F. DMT is encountered as a natural constituent of the bark and leaves of a small number of trees belonging to the genus Virola as well as in the seeds of Anadenanthera peregrina. DMT is not active by oral ingestion. It is commonly used as a snuff. The trees are native to South America. DET is not found in nature.
G. A number of other hallucinogens have very similar structures and properties to those of DMT. Diethyltryptamine (DET) N,N-Diethyltryptamine, for example, is an analogue of DMT and produces the same pharmacological effects but is somewhat less potent than DMT. Alpha-ethyltryptamine (AET) is another tryptamine hallucinogen added to the list of Schedule I hallucinogens in 1994. Bufotenine (5-hydroxy-N,N-dimethyltryptamine) is a Schedule I substance found in certain mushrooms, seeds, and skin glands of Bufo toads. In general, most bufotenine preparations from natural sources are extremely toxic. N,N-Diisopropyl-5-methoxytryptamine (referred to as Foxy-Methoxy) is an orally active tryptamine recently encountered in the United States.

H. Bufotenine occurs in the skin glands of certain toads belonging to the species *Bufo vulgaris*. It has been isolated from the seeds of *Anadenanthera peregrina*, a small South American tree. It is found in mushrooms of the species *Amanita mappa*. Bufotenine is only active by inhalation or intramuscular injection.

I. The last of the controlled tryptamine type hallucinogens is found in an African root called *Tabernanthe iboga*. Ibogaine is one of at least twelve alkaloids present in the root. The drug is taken by eating the root.

J. A related non-controlled group of substances are the Beta-carbolines. Harmine and Harman have been found in hallucinogenic drinks made in northern South America. The substances occur in vines of the genus Banisteriopsis, notably the species *caapi* and *inebrians*. The substances also occur in the seeds of Peganum harmala or "Syrian rue" which is an herb which grows from the Mediterranean, eastwards to northern India, Mongolia and Manchuria.

K. This is an outline, the intention of which is to describe the various techniques that are used for the analysis of Tryptamines in this laboratory. For specific instruction on technique, refer to the particular sections.

**Tryptamines and Simple Indoles**

![Psilocybin](image1)

![DMT](image2)
II. Policy: Below is information regarding screening Tryptamines.

A. Physical Examination
1. One of the primary screening tests for Psilocybin containing mushrooms is a physical examination of material. Such mushrooms have a distinctive unpleasant odor and typically have bluish stains on the mushroom flesh. This blue staining may be due to an enzymatic oxidation of some indole substrate, including psilocybin, upon the breaking or bruising of the mushroom and is a fairly reliable indicator of the presence of psilocybin.

2. A detailed physical description should be included in the case notes in the description of evidence. The description may include the following: "mushroom-like material with stalks and caps-and blue staining"

B. Presumptive Tests

1. Due to the nature of the submitted evidence material and the low concentrations of most compounds of interest, an extraction of the material must be performed. The remaining screening test may be carried out on this extract. Several extraction techniques are available for use. These techniques are described in the "Sample Extraction For Mushrooms" in this volume.

2. pDMBA (para-dimethylaminobenzaldehyde), also referred to as Van Urk's reagent, is a color tests used for the presumptive screening of Tryptamines and general compounds. In general, a purple reaction with the acidified pDMBA test occurs with indoles, pyrroles, and tryptophan and is an indication of the presence of a hallucinogen, including but not limited to psilocyn, psilocybin, DMT, DET, and lysergic acid diethylamide (LSD). **Typically, acidified pDMBA is performed on the extracted material.**

3. The Weber's Test is an additional color test used for the presumptive screening of psilocyn in mushrooms. The procedure is a two-part chemical addition to a small fragment of a mushroom. In the presence of psilocyn the first solution should turn red and subsequently turn blue after the addition of the second solution. **Typically, the Weber's screening test is performed on mushroom material.**

   a. Acidified pDMBA:

      i. Reagent:

         1. 0.01g of para-dimethylaminobenzaldehyde in 18 ml of ethanol and 2 ml of concentrated Sulfuric Acid (H$_2$SO$_4$).

         2. Concentrated Hydrochloric Acid (HCl).

      ii. Procedure: Add a toothpick full of questioned material (or a drop of extract) to one drop of solution a. Next, add one drop of solution b.

      iii. Indicate the color formed.

   b. Weber's:

      i. Reagent:

         1. 1-2 toothpick tips of o-Dianisidine bis(diazotized) zinc double salt (CAS # 14263-94-6) AKA Fast Blue B Salt to approximately 0.25-0.50 ml of H$_2$O

         2. Concentrated Hydrochloric Acid
ii. Procedure: Add a toothpick full of questioned material (or a drop of extract) to one drop of solution a. Note color. Next, add one drop of solution b.

iii. Indicate the color formed.

III. Policy: Below is information regarding extracting Mushrooms.

A. Hot Methanol Extraction

1. Chop or grind approximately 1 gram of mushroom material. Place the material in a small beaker and just cover the plant material with methanol. Heat the sample for about 10 minutes being careful not to boil away the methanol to dryness. The remaining methanol can be decanted and filtered into a test tube then blown down to concentrate. This concentrate may be used for screening and confirmatory tests. However, the addition of heat to the sample may increase the amount of non-psychoactive organic compounds present in the extract. The presence of these compounds may interfere with the isolation and identification of psilocybin and psilocyn using GC/MS. If the resulting chromatogram does not yield an acceptable peak (with baseline resolution) for psilocyn, an acid/basic chloroform clean-up should be performed on the residue.

B. Cold (or Room-Temperature) Methanol Extraction

1. Chop or grind approximately 1 gram of mushroom material. Place the material in a small beaker and just cover the plant material with methanol. Seal the beaker with parafilm. The beaker can be placed in a refrigerator or kept at room temperature. Note that refrigerators containing drug standards cannot be used for case samples. The material can be extracted for several hours (i.e., place in the morning and analyze in the afternoon) or overnight to analyze the next day.

C. Methanol Extraction with Acid/Base Chloroform Clean-up

1. Place approximately 1 gram of macerated mushroom sample in a test tube or other suitable container. Fill container to top of mushroom material with methanol. Cover container with parafilm and allow the sample to sit at room temperature overnight. Decant methanol into a small test tube and blow down to concentrate (<1/2 ml) using a stream of air. Resuspend and acidify the extract with a 0.2 N
solution of sulfuric acid. Wash the solution 2-3 times with chloroform to remove the neutral organic compounds. Make the sample basic with sodium bicarbonate and extract the psychoactive drugs 2-3 times with chloroform. Evaporate the sample to concentrate with a stream of air and use the concentrate for analysis.

D. Basic Drug Extraction

1. Place approximately 1 gram of macerated mushroom sample in a test tube or other suitable container and add 1-2 ml of water. Add 1-2 drops of 10% ammonium hydroxide. Check the pH, if the pH is between 9 and 10 then proceed to the next step; if not then adjust the pH to between 9 and 10. Vortex the sample for approximately 30 seconds. Add 1-2 ml chloroform (or methylene chloride or hexane) and vortex for approximately 30 seconds. Centrifuge the sample. Remove the organic phase and concentrate for identification.

IV. Policy: Below is information regarding confirmation of Tryptamines.

A. The GC/MS can be used to confirm Tryptamines. The recommended procedure for running a sample is as follows:

1. Solvent Extraction
   a. Take a small quantity of the extracted sample to be analyzed.
   b. Extract out with methanol or suitable solvent based on the analyte characteristics and solubility information.
   c. Add a suitable internal standard, n-Tricosane is commonly used as an internal standard. **It may be necessary to use a dilute internal standard.**

2. Analysis
   a. The commonly used method on the GC/MS is GEN.m (other methods can be used for expediency following a positive screening test). Opiate.M is recommended for extracted mushroom samples due to the greater potential for interference on GEN.M
   b. As a routine, 1 µl is injected on the GC/MS
   c. Always inject a blank solvent containing the dilute internal standard used in the sample before injecting the unknown sample onto the GC/MS.
   d. On occasion the samples may be weak such that the molecular ion of the drug is not detected. Such samples need to be concentrated to be identified. A larger volume of sample may need to be injected on the GC/MS
   e. The GC/MS data is in the GC/MS data section of the binder.

3. GC/MS Data of Tryptamine Retention Time/Relative Retention Time

V. Policy:  
Study Topics for the analyst to review with the Trainer.

A. The trainer may review the study topics with the analyst in a written or oral format. The trainer should document that the review has occurred.

1. Describe the Weber's color test reactions encountered on psilocybe mushrooms.

2. What happens to psilocybin when it is analyzed by GC/MS? What compound(s) is/are detected?

3. Due to limitation of the GCMS to detect psilocybin, can the analyst corroborate the presence of psilocybin in the sample?

4. Describe the mass spectra that is obtained from psilocyn and bufotenine, how can one differentiate between the two compounds using GC/MS analysis?

END OF DOCUMENT
The Forensic Services Division exists to provide the public with the highest quality of service in the recognition, collection, preservation, scientific analysis, and interpretation of physical evidence, and its presentation in court. The laboratory does not have a stake in the successful prosecution of a suspect; the laboratory strives to ensure that the probative value of the evidence is understood by all stakeholders in the legal system. The Forensic Services Division provides crime scene processing services to all law enforcement agencies in Contra Costa County. Besides providing full crime scene processing services, laboratory personnel may respond to assist local agencies as a technical adviser, whether for general crime scene advice or to assist at scenes requiring advanced technical expertise such as bloodstain pattern analysis, trajectory analysis, recovery of skeletal remains, etc.

A. Requests: Multiple requests should be coordinated with the crime scene supervisor. Generally, once you begin to process a scene, it must be completed or held until it can be completed. Otherwise, Officer-involved requests take priority. Requests for services can be authorized by the on-call crime scene responder, Detective, Sergeant or above, or Forensic Supervisor or above.

B. Case types include, but are not limited to:
   1. Homicides and suspicious deaths
   2. Officer-involved incidents
   3. Non-fatal assaults
   4. Kidnappings
   5. Arson (to be worked in cooperation with fire department arson inspectors or the State Fire Marshall’s Office)
   6. Bombings (to be worked with assistance from a bomb squad)
   7. Sexual Assaults
   8. Vehicle processing
   9. Documentation and evidence processing of suspects and/or victims
   10. Robberies
   11. Burglaries (Laboratory response may depend on the circumstances and/or the value of the stolen property)

C. Assignment During Business Hours: The daytime Forensic Supervisor will evaluate and assign scenes requested during business hours.
   1. A senior crime scene responder may fulfill this role in their absence.
   2. The Crime Scene Response Assessment Form, CSF.09, may assist in evaluating the type of crime scene response.

D. Assignment After Business Hours: The on-call crime scene responder is required to be available Monday through Friday between the hours of 5 p.m. and 8 a.m. as well as weekends and holidays. Besides scene response, the primary on-call crime scene responder may be asked for advice from local agencies over the telephone.
   1. The laboratory typically will use a two-person crime scene team of a primary crime scene responder and a secondary crime scene responder. Additional personnel may be called to a crime scene as needed.

E. Crime Scene Vehicles: The lab has the following crime scene response vehicles:
   1. Major Scene Vehicle: Stored at FOB, keys available at both Summit and Muir. Contains the most equipment.
   2. Chevy Tahoes: Basic equipment. Sufficient for most scenes, does not have power tools or removable lights. Keys are available at Summit and Muir and it is the only lab vehicle with Sheriff's Office markings and a light bar.

F. Radio use and proper etiquette:
   1. Channels and covered areas. Use the west channel for the west side of the county, central for the central valley, and east for all calls in Martinez/Pacheco and east.
2. Listen for the Code 33 tones—a tone every 15-30 seconds. Only priority traffic is allowed while these tones sound. Call dispatch if Code 33 tones are active.

3. Wait for break in traffic before using the radio. Some traffic (e.g. 11-95s) may require intermittent communication.

4. Speak clearly with radio codes. Can call dispatch (925-646-2441) if unable to remember codes.
   1. Advise when logging on and driving to the scene.
   2. Advise when on scene.
   3. Advise when leaving scene, whether going to secondary scene or returning to the lab.
   4. Advise when off-duty and logging off.
      1. Dispatch will contact you if you do not log off.

G. **Expectations:** The crime scene response team is responsible for responding to a crime scene upon request by a law enforcement agency within the laboratory’s service area. The role of the team at a crime scene will vary according to the laboratory resources, expertise available to assist the requesting agency, and the nature of the scene. Some requests involve general, comprehensive assistance and others may involve providing focused assistance in a specific area of physical evidence (bloodstain pattern analysis, trajectory analysis, chemical enhancement, etc.).

1. **Primary responder.** The primary’s experience should continue to grow to where he or she can document a complex reconstruction. Able to write a clear report detailing observations, conclusions, and interpretations performed at the crime scene. The primary responder is responsible for the following duties at crime scenes:
   a. Assessing the scope of the request
   b. Providing assistance and advising law enforcement personnel on physical evidence
   c. Documentation and collection of all relevant physical evidence
   d. Preparing the crime scene report

2. **Secondary Responder** Photographs, sketching, and other support roles for the primary, including documentation and collection of physical evidence at the direction of the primary responder.

3. **Third Responder** Training role. Able to follow direction from primary or secondary responder.
   a. The role of the crime scene trainee is to provide support to the crime scene team and participate in the crime scene evaluation and processing to the extent their training, experience, and authorization allows.

H. Professional development:

1. Instructing crime scene trainees in crime scene procedures and the evaluation of crime scenes
2. Staying abreast of new developments and current crime scene investigation literature
3. Attending seminars and training in crime scene investigation
4. Researching and developing new crime scene investigation techniques

I. Note, Sheriff’s Office of Emergency Services (phone 646-4461 or available through dispatch at 646-2441) has a variety of equipment and resources available to assist at crime scenes, including a search and rescue team, metal detector, cadaver or tracking dogs, portable toilets, and lights.

J. **Quality Assurance**

1. All procedures used must be generally accepted in the forensic field.
2. Any new methods developed must be validated and approved for use by the laboratory prior to use in any crime scene investigation.

K. **Safety**

1. To prevent contamination of personnel and the scene, the appropriate protective equipment should be used (e.g., gloves, Tyvek suits, shoe covers, dust masks, respirators, eye protection, etc.) See CS.08. Standard laboratory safety protocols should be followed in the field.

2. Ensure that the requesting agency understands they are responsible for providing scene security. Crime scene responders should not begin scene processing until security has been provided and should not continue processing the scene if reasonable security is not maintained.

3. Each crime scene responder that has completed safety training, working with or around chemicals, and biological material, is responsible for being aware of the hazards of those materials. The responder is responsible for knowing how to safely handle these hazardous chemicals or materials. Each responder is responsible to wear the appropriate personal protective
equipment and know when it is required. Each responder is responsible for following the safety procedures set forth in the Safety Manual.

4. A crime scene is a possible source of a variety of potentially infectious materials. Refer to the safety manual for the laboratory's safety practices.

5. Evidence collected for transport back to the laboratory should be packaged to maintain its integrity and prevent contamination of personnel or other items. Individual paper bags are often not suitable for packing exhibits of wet blood since it may seep through. Double paper bags or plastic bags may be used temporarily to contain such items while they are in transit to the laboratory.

6. Examination utensils (e.g., forceps and scissors) used in processing shall be placed in an appropriate container for subsequent disinfecting at the laboratory.

7. When using aerosol chemicals such as BlueStar, proper work practice controls and procedures must be taken to avoid chemical exposure. Note: prior to using BlueStar in the field, the requesting agency must be informed of the hazards associated with clean-up as they will assume all liability associated with its use. Chemicals currently on the carcinogen and suspected carcinogen list shall not be used on live persons. When the responder uses such chemicals proper safety precautions shall be taken (i.e., gloves and breathing apparatus will be used).

END OF DOCUMENT
I. The initial actions taken by the Crime Scene Responder prior to and upon arrival at the scene are paramount to understanding the nature of the scene and the appropriate collection techniques. The primary scene responder is responsible for all forensic activity at the crime scene. The on-call supervisor will be notified prior to crime scene response.

A. Initial Response Request

1. Document the time and date of the request for scene processing and who made the request.
2. Document the information provided regarding the scene and the source of the information. This information should include the following:
   a. Location of the scene.
   b. Any known injuries to any individuals.
   c. Condition of the crime scene (e.g. indoor vs. outdoor, lighting, weather conditions, etc.).
   d. General type of evidence (shooting, stabbing, sexual assault, etc.).
3. Ascertain whether a search warrant or consent has been obtained or is needed.
4. Provide the requesting agency with an estimated time of arrival.
5. Attempt to determine if any specialized services or equipment may be required.
6. Obtain contact information for an investigator at the scene.
7. Notify the on-call supervisor of all call outs.
8. Notify the Officer of the Day of all non-Sheriff's Office protocol-invoked call-outs. This will typically be accomplished via a request to Dispatch to notify the Officer of the Day.

B. Timely Response

1. The responders on-call shall work together to determine how to respond as quickly as possible, except in circumstances where a search warrant has not been obtained or the scene is not secure.
   a. Each responder is responsible for having a camera kit, note pad, and flashlight ready for expedited response.
   b. The responder with the shortest response time, regardless if they are primary or secondary, shall respond solo to represent the laboratory at the scene and begin the documentation process.
      i. Home garaging of laboratory vehicles is approved subject to SO policy 1.07.42.
   c. The initial responder will communicate with the other responders to request additional equipment needed for the scene (e.g. Leica scanner).

C. Primary Responder Responsibilities

1. Upon arrival at the scene, the primary responder should contact the Lead Investigator.
2. On scene, the primary is responsible to:
   a. Coordinate all forensic activity to include the collection and preservation of any evidence.
   b. If the primary responder is functioning as a technical advisor, they are responsible for general advice and documentation of the complex activity. The primary responder should direct the client agency's personnel to collect evidence with the complex activity.
c. Communicate the need for any additional resources to the on-call supervisor.
d. Notify the on-call supervisor of all follow-up requests for the following business day and of any issues or concerns about the scene or evidence. Issues or concerns may include unusual circumstances, the inability to provide a requested service, the presence of outside experts, equipment failure, etc.
e. Notify the Lead Investigator when the team is ready to depart the scene.

3. During follow-up activities, the primary responder will coordinate the disposition of all evidence collected with the Lead Investigator.

4. The team will be responsible for replacing any consumables that have been used at the crime scene and ensuring that the Crime Scene vehicle is restocked and ready for the next call-out.

5. The evidence shall be logged into LIMS in a timely manner, but should not exceed 7 days absent exigent circumstances.

6. The primary responder will advise the on-call supervisor of any ancillary scenes (e.g. vehicles or autopsies).

7. As appropriate, the primary responder will meet with the crime scene supervisor to review the call-out.

8. The Laboratory Director shall be kept informed via the chain of command of any concerns or issues involving the processing of evidence or relationship with our client agencies.

D. Preliminary Scene Information and Assessing the Crime Scene

1. Document the time of arrival at the scene and personnel present.

2. Ensure that the scene has been secured appropriately.

3. Establish boundaries encompassing all potential areas of interest.

4. If the agency has not started an entry and exit log (this is the responsibility of the requesting agency), advise the agency to start one and note the advisement.

5. Document all pertinent information regarding the scene investigation and the source of the information (see CSF.01 and ).

6. Establish a path of entry to be used by all personnel.

7. Conduct a walk through of the scene to identify and protect potential transitory evidence.

8. Determine level of personal protective equipment required. Personnel allowed within the scene should have specific duties and should be kept to a minimum.

9. Note any specific requests from investigators.

10. Determine if the Leica scanner should be used.

E. Crime Scene Searches

1. A systematic search needs to be conducted in order to locate evidence. While the information provided by the investigator may assist in the search, that information is almost never complete and the scene responder should stay alert for all types of evidence.

2. All evidence will be properly collected. When collection is not possible or warranted, the reason should be documented appropriately. Refer to the specific steps listed in each procedure.

F. Release of the Scene/Final Survey

1. Re-contact the lead investigator to discuss your findings and describe what evidence was collected.

2. Perform a final walk-through of the scene with the lead investigator (if possible) and address any additional requests.

3. Ensure that all the evidence is accounted for and determine its final disposition.

4. Retrieve all equipment and materials generated during the investigation.

5. Consider the need for additional photographs to show the final condition of the scene (e.g. damage to walls after bullet recovery, after a vehicle is removed).

6. Document the time of departure from the scene.

END OF DOCUMENT
I. All crime scenes will be processed with the highest quality of service in the recognition, collection, preservation, and interpretation of evidence.

A. **Photography** records the appearance and condition of the crime scene and physical evidence at the time of processing. A series of photographs will be taken to document the crime scene, unless the crime scene responder is functioning in a technical adviser role. The entire crime scene will be photographed prior to moving or collecting any evidence except under exigent circumstances (example: significant rain or a crowd threatening to breach the perimeter). The reason for and method of any movement or collection of evidence done prior to photographs will be clearly recorded in the notes. The series of photographs will include overall, medium, and close-up photographs. Generally, photographs should be taken in a progressive order as one would walk through the scene. Although sometimes unavoidable, try to avoid taking sequential photographs of completely different areas or unrelated items as much as possible.

1. **Overall photographs** show the overall condition and layout of the crime scene. The following types of overall photographs should be taken:
   a. Multiple angles to capture the layout of the scene. Include some common features or landmarks between each photograph to allow for overlapping photographs later, if needed.
   b. Landmarks (house numbers, street signs, telephone poles, etc.).
   c. Approaches, entrances, and exits to the scene.
   d. Condition of all associated vehicles.
   e. Evidence overalls, both with and without cones. Note, when the evidence is marked with cones prior to arrival, this may not be possible.
   f. Surrounding areas.
   g. The body.
   h. Area beneath the body **after** the Coroner’s Deputy removes the body.

2. **Medium range photographs** do the same in more detail and establish the relationship between different objects. Medium range photographs should include:
   a. Landmarks necessary for orientation
   b. Perspective to show the relationship between items. This is often done by taking pictures perpendicular to each other.

3. **Close-up photographs** capture the detail of evidence, injuries, or other important features. Close-up photographs should include:
   a. The evidence.
   b. The evidence, cone, or other identifying marker and a scale.
   c. If taking a close-up photograph out of order, take a medium-range orientation photograph beforehand.

4. **Tripods** allow for proper photography of impression evidence and are required when slow shutter speeds or timed exposures are necessary (e.g. laser trajectory analysis, “painting with light”, ambient light photography, etc.).

5. If a crowd is present, photographs of the crowd and people in it may be useful.

6. All photographs require proper lighting techniques and camera settings.

B. **Sketches:** Crime scene sketches serve to establish spatial relationships, provide an overall scene view, assist with preparation of demonstrative aides for court, and may serve as an investigative aide during interviews. In addition, sketches can clarify items of evidence in a crime scene without extraneous items such as furniture, piles of debris, etc. Determine the best perspective and method of sketching the scene. Consider items that should be included and
excluded. While a sketch made at the scene is usually drawn roughly and not to scale, the crime scene responder should attempt to make the sketch proportional to the correct spatial relationships depicted between the various items of evidence. Multiple sketches may be needed depending on the circumstances:

1. **Overview Sketch**: A sketch on one horizontal plane that shows the scene as if viewed from above. This type of sketch is used to record a “birds-eye view” of a building floor plan or exterior scene.

2. **Elevation View**: A sketch on one vertical plane that shows the scene as viewed from the side. This type of sketch depicts an orthogonal view of vertical surfaces such as walls, doors, etc., and may be used to show relative heights and positions of evidence or structures. It can be used to record vertical measurements of evidence on various exterior or interior surfaces at the scene, such as a bloodstain pattern or a bullet hole.

3. **Sectional View**: This type of sketch may be used to show details of a specific area in a scene or larger objects. Examples - the inside of an automobile or a cut-away interior view of a structure.

4. **Exploded View (Cross-Projection) Sketch**: This type of sketch is a combination of an overview and elevation sketch. It depicts the horizontal and vertical planes of a room or structure as they would appear laid out flat on the same page, with the common edges shown to allow one sketch to be easily related to the other. This may be useful for trajectories or bloodstain patterns that extend between a wall and the ceiling.

5. Pertinent measurements may be placed on the sketch or recorded on a separate page with reference points clearly defined. Example: distance between a weapon and the victim's hand.

6. The following is a list of items that must be included in a rough sketch:
   a. Compass orientation
   b. Items of evidence/markers
   c. Title describing sketch (e.g. north bedroom)
   d. “Not to scale”
   e. Case number, date, initials
   f. Measurements from reference points to items of evidence/marker may be included on the sketch or on a separate page
   g. Additional objects that enhance evidence location (e.g., furniture, geographical features, roads, etc.)
   h. Permanent reference points (if appropriate)

C. **Measurements**: Generally, all items of evidence should be measured along with overall measurements to document the layout of the scene. Measurements record the spatial relationships of objects and, when necessary, enable scale reproductions. The following measurement techniques (or a combination of techniques) may be used to record measurements, depending on the layout of the scene and availability of convenient landmarks:

1. **Rectangular coordination**: is the most common form of measurement. Two measurements at right angles are made from fixed objects, such as walls, to the item. Take measurements from perpendicular lines. Example: 5 feet west of the east bedroom wall and 2 feet south of the north bedroom wall. Example: In intersections, the projection (extension) of the curb lines allows for continued use of this system.

2. **Triangulation**: Taking a measurement from two fixed points for each item. Measurements are taken between two fixed objects and then from the fixed objects to the item of evidence, forming a triangle. Record the distance between the two points as well as the relative position of the measured item. Example: item #1 is 5 feet from point A, 6 feet from point B, and north of the line AB.

3. **Baseline method**: Extend a line between two fixed points and record the rectangular coordinates. Lay a tape down so that it crosses the entire room or area to be measured. Establish a reference point at each end of the tape, designated by a number or letter. The tape which runs between the two reference points becomes the baseline for all other measurements in that area. Measurements are then made from the baseline to the item of evidence. Example: the perpendicular distance from the line to each item and the distance from one of the fixed points to the point on the line corresponding to the item. Compass directions or +/- distances can be used to denote which side of the baseline a particular item of evidence was measured from.

4. **Polar coordinates**: Measure both the distance and direction (angle) that an object is from a single reference point. Example: 42 feet from the north edge of the telephone pole in a direction of 15 degrees east.

D. **General Note Taking**: Notes serve to record observations made during the processing of the crime scene and are recorded in addition to photographs. The crime scene responder will record observations, not conclusions. Multiple observations can lead to a conclusion. Notes will reflect:

1. A narrative about the crime (who, what, where, when, why, how).
2. Observations based on the senses of touch, sound, sight, and smell. **Example**: pertinent weather conditions.
3. Observations not documented by photograph or sketch. **Example:** movement of items by first responders.

4. Areas of the scene through which first responders or emergency services personnel may have traveled.

5. Altered conditions such as twilight to darkness.

6. Absence of items searched for but not found. **Examples:** weapons, personal items such as a wallet.

7. Items seemingly out of place. **Examples:** a knife on living room floor or a hammer in bathroom.

8. Transient objects. **Examples:** ice cubes in a glass on nightstand or a warm saucepan while stove is off.

9. Items found at a scene, both those collected (recorded in the evidence inventory) and those not collected (e.g. scuff marks in soil).

10. Location and condition of items. **Examples:** clothes and magazines strewn about living room, neat living room with magazines stacked on coffee table, the trunk contained jumper cables, a FAX machine, a backpack containing a digital scale, $842 in U.S. Currency, and mail addressed to Peter Gibbons.

11. Missing items. **Example:** dusty coffee table with clean rectangular void.

12. Physical evidence. **Examples:** anything tangible that may be related to the commission of a crime, a cartridge case headstamped “R-P 40 S&W”, an off-white stain on a piece of tissue paper, etc.

13. Reference times. **Example:** time of arrival, time of departure, etc.

**E. Body Processing:** A complete set of photographs should be taken from all sides of the body with overlapping photographs from head to toe. A set of notes describing the appearance, position, and condition of the body will be taken. Describe the location and nature of all wounds. Take close-up photographs of the hands, including the condition of the fingernails. Note any decomposition.

1. Do not disturb the clothing or personal effects without permission from the Coroner’s Office.

2. Take tape lifts if appropriate.

3. Collect a GSR kit if appropriate. If trace evidence from the hands (GSR, etc.) will be collected at the autopsy rather than the scene, bag the hands prior to the body being transported to the morgue.

4. Photograph any ligatures in place.

5. When the Coroner’s deputy arrives to remove the body, photograph the other side of the body (e.g. the back if the victim is lying on his stomach).

6. After the body is removed, photograph the area that was beneath the body and search the area for evidence.

**F. Subject (live victim or suspect) Processing:** An investigator will often request photographs and collection of a subject’s clothing. Take notes of the subject’s clothing and any injuries. Take a series of photographs to document all four sides, including:

1. Overall (head to toe) view.

2. Facial views, all four sides.

3. Front and back of hands.

4. Wounds (visible or claimed), tattoos, scars, and any additional pertinent marks.

5. Condition of clothing, blood, dirt, or other contaminants.

6. All bloodstains on clothing, skin, hair, or any other surface associated with the suspect.

7. Collect fingernail clippings if appropriate.

8. Collect a buccal swab if appropriate.

9. Have the subject stand on a piece of butcher paper and remove their clothes.
   
   a. Collect the clothing and the paper (fold up paper to preserve any trace evidence that may have been shed when the subject disrobed).

10. After collecting the subject’s clothing, repeat the same series of photographs.

11. Photographs will be taken orthogonally, both with and without a scale, depending upon the type of evidence being documented.

12. Ask the subject if he/she is injured anywhere and photograph any areas that are identified.
G. **Vehicle Processing:** The same general documentation procedures apply to processing a vehicle. Other areas to include in the photographs:

1. License plates
2. VIN
3. Decals
4. Seats and floorboards
5. Headliner
6. Interior of glove box and center console
7. Position of controls (A/C, radio, etc.)
8. Interior of trunk
9. Interior of engine compartment, if appropriate

II. **Specialized Instrumentation may be needed to locate, identify, or document evidence.**

A. **Alternative Light Source (ALS)**

1. The ALS uses barrier filters to isolate the visible wavelengths of light. Darken the area and systematically vary the wavelength and filter to observe fluorescence or absorption.

B. **Leica Laser Scanner or equivalent**

1. The Leica scanner employs a 3D laser scanner and a panoramic digital camera to map the area of interest. This produces a TruView™ of the scene which allows subsequent virtual navigation of the scene and the ability to measure and annotate items.

2. The crime scene responder has the discretion on whether or not to use the Leica scanner at the scene, unless the agency requests it.

3. If deployed, the raw scanner data must be burned to disc, maintained, and communicated to the agency in the crime scene report.

   a. If any TruViews™ are created, these too should be burned to disc and maintained in the laboratory.

   b. If the TruView™ is created before the crime scene report is completed, the raw scanner data and the TruView™ may be burned onto a single disc.

4. Refer to INSCS.05, INSCS.06, and INSCS.07 for instructions on using the Leica scanner.

III. **Evidence Collection:** It is important that items of evidence be collected, handled, and stored in a way that will ensure their integrity. General guidelines include:

A. Protect yourself and others.

B. Consider all types of forensic evidence.

C. Begin the chain of custody.

D. Document location with notes, sketches, and photographs.

E. Mark evidence and packaging with a case identifier, initials, and date.

F. Package all evidence separately.

G. Allow wet biological stains to air-dry.

H. Obtain standards if needed for a comparison of evidence.

I. Use packaging that is appropriate for the specific type of evidence such as paper bags, envelopes, plastic bags, cardboard boxes, tamper-proof sealing, etc.

J. A proper seal ensures that evidence has not been accessed, altered, compromised, or lost during storage. Initial and date across the tape seal.

END OF DOCUMENT
Photography is one of the single best methods of crime scene and evidence documentation. Photographs taken at crime scenes are commonly used in court proceedings, for analysis, and for later reconstruction. This type of evidence memorializes the scene as it was when the incident occurred and provides a graphical illustration to the Judges and Jurors who will ultimately decide the fate of an accused. The ultimate objectives of crime scene photography is its intended eventual use as evidence in a criminal proceeding, for analysis, or to aid in the re-construction of a particular crime or law enforcement related event. The value of proper and professional crime scene and evidence photography cannot be overemphasized.

A. Introduction
   1. Crime scene and evidence photography is a technical and structured process that requires a series of overall, intermediate, and close-up photographs. The proper compositions in crime scene photography are designed to put the scene in context with the evidence and the evidence in context with the scene. This systematic approach is essential for documentation of evidence related to the incident and the scene through photography.

B. Equipment
   1. Digital Single Lens Reflex (SLR) camera.
   2. Batteries (alkaline or lithium).
   3. Recording media (memory cards).
   4. Flash units.
   5. Camera accessories, including cords, filters, slave units, and lenses.
   6. Tripod.

C. Operation of the Camera
   1. Refer to digital camera instruction manual for operation procedures: Canon 20D, Canon 40D, Canon 50D, and Canon 60D.
   2. Images will be taken with the camera set at the highest resolution setting.
   3. Only a single case will be shot on a single media at one time. If the images from one case have not been downloaded, a second “fresh” media must be employed for a second case.
   4. Each photograph should be viewed while still on the camera to ensure the chosen settings were adequate. However, images should not be deleted. If an image is unacceptable, additional images should be taken. The images will be uploaded to Veripic (see QA.21) or burned onto optical disc.
   5. The proper lens with appropriate aperture, shutter speed, ISO, and flash settings should be used for each photograph.
      a. The correct exposure can be accomplished by using different combinations of settings.
   6. Using a flash is an essential skill in crime scene photography. Many scenes are during night and use of fill flash to illuminate shadows is required for many photos.

D. Photography as Evidence
   1. Certain types of impression evidence, including tire tracks, footwear impressions, bite marks, and fingerprint ridge detail, are examples of impression evidence that may be treated as evidence according to FSD.42.01.
      a. The salient requirements include the use of a scale, a lossless format, and burning the images to disc, entering the disc in LIMS, and treating the disc as evidence.
b. Refer to FSD.42.01 for all requirements.

E. Photography as Documentation

1. All the photographs taken at a crime scene are not considered to be “evidence” by the Forensic Services Division. However, their importance cannot be overstated.
   a. There are countless examples of types of evidence that are best collected through use of photography. Photography, may in fact at times, be the only method of collection of certain types of evidence. Items encountered may be too fragile or difficult to physically collect without the risk of damage or destruction.
   b. Examples of these items may include an injury on human skin, tool impression evidence left at the scene of a crime, skid marks and road damage left on the pavement at the scene of a vehicular homicide, transient evidence such as ice cubes in a glass and bloodstain patterns.

2. Photographs become an important part of the investigation, and could be potentially valuable for the prosecution or defense during a criminal proceeding, even if the images are not actually used in court.

3. Photographs collected during a criminal investigation must be handled properly in order for them to maintain their value and integrity.

4. Refer to policy FSD.42.01 for specific information on handling, storage and retention of crime scene photographs.

F. General Photography Procedures

1. Prior to beginning photography of a scene, the photographer should prepare an identifier that lists certain relevant information about the case.
   a. The relevant information includes the case number, agency number, crime scene responder information and date.
   b. The identifier can be a pre-printed form, a portion of the Field Services Information Form, or just a piece of paper with the requisite information on it.
   c. The media in which the information is written is not as important as the information itself.
   d. When working an investigation with multiple locations or secondary scenes, a new identifier should be completed reflecting the change in location prior to beginning photography.
   e. When shooting with a digital camera, most of the camera settings can be acquired post capture from the cameras metadata. An exception to this is when any filters or alternative light sources are integrated. When using a technique or device during capture that will not be recorded in the camera’s metadata, that information should be reflected in the case record.

2. Perspectives and Compositions
   a. In order to capture a complete and accurate documentation of the crime, photographs of the scene and all evidence must be linked to one another in a succinct and logical manner.
   b. Photographs taken from crime scenes must make sense to the individuals who will eventually use them in determining the significance of the evidence.
   c. Nothing in the crime scene should be moved, altered, or collected until it has been photographed, absent exigent circumstances.
   d. There are three standard perspectives that must be included during crime scene photography: overall, intermediate and close-up. Each perspective is interdependent upon the other to do its job in telling the entire crime related story. In order for this process to work seamlessly, the photographer must integrate the proper techniques during each perspective. The photographer must not skip a step between overall and close-up photography, nor should the photographer skip the overall or close-up perspectives because they feel that they have accomplished those objectives in documenting an item of evidence during another perspective.

3. Overall photography - In order for the significance of any item of evidence to make sense to the viewer it must be logically related to the scene. In order for the location and conditions of the scene to make sense to the viewer it too must be related logically. Overall photography is the perspective that relates the entire scene to its physical surroundings.
   a. Perspective- The correct perspective is full standing height, or a natural perspective. Elevated, kneeling, or prone perspectives should be supplementary to the normal standing views.
b. **Exterior overalls** - The photographer should properly and completely document the entire exterior of the location.
   
i. Overall exterior views should start with landmarks that put the scene in geographical perspective to
the viewer. Example: street signs, intersections, and house numbers.

c. **Lens and angle selection** - Photographs of the exterior of residences and buildings should be taken with
a normal perspective lens, and should be taken at right angles to one specific side of the structure at a time.
   
i. Shooting from a corner of a structure, or a diagonal view, can cause a distorted perspective and
should supplement the standard right angle, parallel views.

d. **Interior overalls** - Complete interior overall views should be captured.

e. **Four corner photography** - In rooms that are square, somewhat square, or rectangular the photographer
can shoot at opposing corners from an opposing corner. When using a wide angle lens the overall interior
photography may be able to be completed in as little as four shots. When the room contains closed doors
and closets, the photographer should document the room in its condition of discovery, and then follow up
with a sequence of shots with the closets and closed doors in the open position to show the items contained
within the closets.

f. **Parallel overall interior photography** - When the physical size of the room is of importance to the type of
crime being investigated, the type of photography to accurately illustrate the scene is also of importance.
When contrasted with other photographic techniques, photographing interior walls with the camera’s film
plane parallel to the wall being photographed, while using a normal perspective lens, is the best approach.
This technique eliminates spatial distortions caused by wider angle lenses, and any distortion caused by
off angle or diagonal photography. This method also ensures proper and even illumination when using a
flash to photograph the interior of a scene, and ensures a consistent depth of field. Although more images
may be necessary to completely document the scene, one must always remember that film is cheap and
digital images are even cheaper. As with the four corner photography technique, when the room contains
closed doors and closets, the photographer should document the room in its condition of discovery, and
then follow up with a sequence of shots with the closets and closed doors in the open position to show the
items contained within the closets. When photographing closets, the photographer should position the film
plane of the camera parallel to the wall containing the closet or closed door. An off camera or remote flash
technique may be necessary to properly illuminate larger closets.

g. **Victim/Officer/Suspect’s perspective** - In many cases it may be helpful to obtain photographs of an
individual’s perspective as they stood at a particular place.

4. **Intermediate/midrange photography** - The perspective between overall and close-up that is used to relate items
of evidence to a fixed feature within a scene. Example: a handgun and its relationship to the front door.

5. **Close-up Photography** - The close-up perspective is the final perspective necessary in completing the crime
related photographic story. These views are very specific and their compositions distinctively isolated to one item
of evidence at a time.
   
a. Each item of evidence must be photographed with a close-up perpendicular perspective.

b. The item of evidence must fill the frame as much as possible.

c. Lens selection is an important element for consideration during close-up photography.

d. All items of evidence should be photographed without and with a scale.
   
i. The scale should be situated along side of the evidence at the same focal plane as the actual object
or impression.

ii. Disposable adhesive scales are convenient for vertical surfaces.

e. After an item of evidence is photographed “in place”, both without and with a scale, it may be moved from
its original location for additional photography.

END OF DOCUMENT
I. The Forensic Pathologist determines which examinations are to be conducted at the autopsy and the crime scene responder's function is to document with photographs and collect evidence. The following procedures should be followed for most autopsies, though may not be applicable to all cases.

A. A series of photographs will be taken to document the deceased.
   1. Include a photograph of the Coroner’s tag with identifying case information.

B. Clothed and unwashed:
   1. Complete coverage of body surface from above, both sides, and back.
   2. Follow overall photography with medium range photographs that cover all sides of the body.
   3. Take close-up photography on any areas that appear significant (using a scale).
   4. Photograph both sides of the hands.
   5. Photographs of any visible injuries, pertinent marks, scars, and tattoos - with and without a scale as appropriate.
   6. Collect any trace evidence.
   7. Photograph any ligatures/bindings and preserve knots when removing.
      a. NOTE: the Pathologist will want to see the ligatures in place.
   8. Examine the area around any gunshot wounds for gunpowder particles.
      a. Take multiple perpendicular photographs.
      b. Consider using an acetate sheet to trace any pattern present.
      c. Collect a sample of any gunpowder particles.
   9. Collect fingernail clippings. If nails are too short to clip, collect swabs from around nail ends on fingertips. Individual nail end swabs may be appropriate.
   10. If a sexual assault is a possibility, consider using an alternative light source (ALS) to examine the body.
   11. Collect tape lifts if appropriate.
   12. Collect clothing, placing each item in its own container. Cut clothing off if appropriate.
   13. Collect hair standards if appropriate.

C. Unclothed and unwashed:
   1. Photograph the same series of views taken prior to removing the clothing.
   2. Photographs of any injuries, marks, and tattoos that were not previously visible, with a scale.
   3. If a sexual assault is a possibility, consider taking swabs of the nipples and other areas that may have been licked or touched by the suspect.
   4. Collect pubic hair, arm hair, leg hair, and other standards as appropriate.

D. Unclothed and washed:
   1. Photograph the same series of views taken prior to removing the clothing.
   2. Photographs of both sides of the hands.
   3. Photographs of injuries, marks, and tattoos, with a scale
4. Photographs at the request of the Pathologist or Detective.

E. **Under the Pathologist's direction:**

1. Any photographs that the Pathologist requests during examination of the body or during the Pathologist's examination of the internal organs.

2. Photographs to document any trajectories as determined by the Pathologist.
   a. Photograph each probe from at least two mutually perpendicular angles as well as down the axis of the probe.
   b. Consider photographing each probe from a head-to-feet view and from side-of-body view.
   c. Consider photographing probe with body in purported position at time of shooting.

3. Collect any bullets as the Pathologist removes them from the body. If trace evidence is not a concern on the bullet, rinse the bullet before packaging.

F. **Additional considerations:**

1. If X-Rays were taken of the deceased, take photographs of the radiographs showing the location and condition of the bullets inside the body. Turn off the flash when taking these photographs.

2. If the deceased was dismembered, consider obtaining cut ends of bones or casts of the cut ends of bones.

3. If the victim was stabbed, ask for the Pathologist's opinion if the blade was single or double edged, minimum blade width, and minimum blade length. This information is only to be recorded in the notes, not the report as it may be a preliminary opinion by the Pathologist.

4. Consider collecting a rib bone as a DNA reference standard.

5. If any teeth were broken, consider casting fragmented ends if the teeth can not be collected.

6. Contact the Identification Unit (957-7101) to obtain major case prints of the deceased.

G. **Casts of ridge detail**

1. Crime scene responders may need to obtain casts and photographs of fingerprint ridge detail if the Identification Unit is unable to. Generally, casting fingerprints is for mummified remains.

2. Accutrans will be used to cast fingerprints. Accutrans is similar to Forensic-Sil in its use. White Accutrans is preferred.
   a. Identify and document the fingers that will be cast.
   b. Apply a light coating of fingerprint powder.
   c. Cast one finger at a time.
      i. Load the Accutrans cartridge into the dispenser and place the mixing tip onto the cartridge opening.
      ii. Exude and discard the Accutrans until the Accutrans is evenly mixed at the tip.
      iii. Steadily apply the casting material to the finger.
      iv. The Accutrans will need approximately 3-6 minutes to set.
      v. Remove the Accutrans from the finger. Package and label each cast.

END OF DOCUMENT
I. During a criminal investigation, the analyst may be called upon to process a vehicle for physical evidence relating to a crime. This vehicle may or may not be the primary location of the crime, but should be treated as a crime scene and given the same attention as given to a primary scene. The evidence inside a vehicle may yield valuable information to solving the investigation or identifying suspects involved. The type of evidence that should be searched for in a vehicle will be dependent on the type of crime being investigated. It is important for the analyst to establish a specific and organized approach to processing a vehicle. Detailed notes and photographs should be gathered to identify specific elements and information of both the scene and the vehicle.

A. Procedure

1. Confirm that consent has been given to search from the registered owner or a search warrant has been obtained for the vehicle. If legal access cannot be immediately granted, the vehicle may be towed and held until it can be processed.
   a. Note, the laboratory is not responsible for towing vehicles.
   b. The laboratory will not respond for the sole purpose of processing a vehicle after business hours unless authorized by the crime scene supervisor, Manager, or Chief.

2. The vehicle should be secured when possible (windows up and doors locked) prior to towing. When possible, the vehicle should be placed inside a garage.

3. The analyst should develop a systematic approach to processing a vehicle. The types of evidence found in a vehicle will be dependent on the types of crimes being investigated.

4. Document the vehicle as it is found. Note the make, model, color, license plate number, state of issue, vehicle identification number (VIN), and year of registration.

5. In some cases, the specific location of the vehicle may be of important evidentiary value. In these cases, specific measurements to place the vehicle at the scene should be collected. To properly place a vehicle at a specific location, two sets of measurements, a north/south and an east/west measurement, should be collected from at least two (2) points on the vehicle. These measurements should be taken from two (2) fixed and permanent areas of reference at the scene, a north/south and an east/west reference. A ground height to the vehicle at these points should also be taken.

6. Any transient details regarding the condition of the vehicle should be noted. For example: hood - warm/cool, windows - down/up, exterior - wet/dry/condensation, odors - present in the vehicle, steering column - intact/damaged, ignition switch - intact/damaged, lights - on/off, door - locked/unlocked, mileage and gas gauge, seat position, position of the gear shift, tire conditions etc.

B. DAMAGE: Document any interior and exterior damage to the vehicle.

1. If applicable, any exterior damage to the vehicle should be examined for potential evidence of paint transfer. If evidence of paint transfer is noted, a paint transfer sample should be collected. If a paint sample is collected a paint standard will also need to be collected from the vehicle. This paint standard should be collected from an undamaged area in the same proximity as the area where the paint sample was collected. These items should each be collected with a steel dissecting scalpel and packaged separately.

2. If applicable, glass standards should be collected from all broken glass on the vehicle.

3. Glass or plastic from broken headlights or taillights should be collected and preserved for possible physical matches to broken glass collected at any associated scenes and for examination of the filament to determine whether the light was on or off before the impact.

4. Other physical evidence specific to the criminal act being investigated should also be searched for and recovered.
5. In cases of burned vehicles, collection of samples may be necessary to determine if any accelerants were use
during the commission of the crime. These samples should be collected in an appropriately sized arson can and
sealed immediately at the scene. Depending on the condition of the vehicle and the localization of the fire
damage, collection of more than one sample may be necessary.

C. PHOTOGRAPHY: Photographs should be taken of the vehicle to not only place the vehicle at the scene, but also to
note the condition and direction of the vehicle.

1. The vehicle should be photographed from all four directions and all four corners.
2. Photographs should be taken of the license plate and, when appropriate, any decals or custom accessories on the
vehicle. Close-up photographs should be taken of any damage to the vehicle.
3. When photographing multiple bullet holes in a vehicle, it may be necessary to document each bullet hole, either
with removable stickers or other identifiers, so that close-up photographs of individual bullet holes can be
distinguished from one another and so that they can be placed by location on the vehicle.
4. When using trajectory rods or wooden dowels, photographs should be taken prior to insertion of the rods and
again with the rods in place.
5. Bullet holes in the vehicle should be measured (See CS.09 for details on trajectory interpretation).
6. The interior of the vehicle should be photographed. Photograph each interior door. Photographs should be taken
of the driver’s side and the passenger side, the ignition area, the dashboard display, the glove box, the rear seat,
the trunk area, and underneath the hood if it is related to the crime.

D. EVIDENCE COLLECTION: An organized and systematic approach should be used to search the vehicle. The
vehicle may be divided into sections, similar to an organized zone search pattern, to ensure that all areas of the vehicle
are searched. The analyst needs to practice on the side of caution when searching underneath seats or in difficult to see
areas. A small mirror and a flashlight will allow the analyst to search these areas without the risk of exposure to
potential hazards.

1. The analyst should collect the most fragile evidence prior to searching the entire vehicle. Evidence becomes
fragile by the passing of time, exposure to the elements or other environmental factors, movement, and improper
handling.
2. Examination of the interior of the vehicle, when exterior bullet holes are present, will yield potential areas to be
examined for spent bullets or fragments.
3. Any blood located inside of the vehicle should be collected when applicable. Removal of the entire sample would
be ideal for blood collection. If this is not feasible, a swab of blood sample should be collected.
4. In sexual assault investigations, if the crime occurred inside of the vehicle, the interior of the vehicle may need to
be examined with an alternate light source or chemical screening for the presence acid phosphatase (cross
reference to 7.3 Biological Evidence) to help detect any biological evidence deposited. Any drinking containers,
such as bottles or straws, may also be collected for potential DNA analysis and latent prints.
5. Burglary tools, weapons, drugs, paperwork, or stolen property specific to the crime should be collected.
6. Depending on the type of crime being investigated and the circumstances in which the vehicle was involved, the
collection of carpet and upholstery standards may be necessary.

E. LATENT PRINT PROCESSING: After the entire vehicle has been thoroughly searched and documented, one of the
final phases in vehicle processing is the processing for latent fingerprints, if applicable.

1. Exterior of the vehicle
   a. Use a high intensity light to search for any obvious ridge details on the doors, the trunk, and the hood area.
   b. Processing an approximate 6” wide area around the sides, hood, trunk, and fuel door, concentrating on
areas that would be touched in general usage. In addition, roof support posts and the exterior of windows
should also be printed.

2. Interior of the vehicle
   a. Generally, the rear view mirror, door handles, seat belt buckles, windows, gearshift, vanity mirrors, and the
   stereo face should be printed.
   b. Any item located inside the vehicle that may have been handled and possess print evidence should also be
processed for latent prints.
   c. Note: The crime scene supervisor must approve the use of cyanoacrylate ester fuming and dye staining
prior to use.
I. Impressions of fingerprints, known as latent prints, may be left behind on a surface by the natural secretions of sweat from the eccrine glands that are present in friction ridge skin, or by other contaminants present on the skin. Latent fingerprints, which are left when an object is touched or handled, are not always visible but can be developed using a variety of methods. A fingerprint in its narrow sense is an impression left by the friction ridges of a human finger. In a wider use of the term, fingerprints are the traces of an impression from the friction ridges of any part of the palmar side of the hand or the sole of the foot. The ridge formations associated with the friction skin develop during the fourth month of gestation and are permanent until decomposition at death.

A. Introduction: The most common form of latent print processing in the field is powder processing or dusting for latent prints. Other processing methods, including amido black, may be used depending upon the circumstances of a particular case and the expertise of the analyst.

1. Collect trace evidence prior to any fingerprint processing.

2. Depending on the circumstances of the case, it may be important to collect biological evidence prior to fingerprinting. A determination should be made which type of evidence is more useful to the case. Discuss this decision with the assigned detectives as appropriate. Example: if a knife was used to kill the victim and the knife handle is void of blood, processing the knife for latent fingerprints may be more important than determining whose blood is on the knife’s blade.

B. Visual Examination

1. Examine the surface of an item for visible prints, trace evidence, and biological evidence before processing it for fingerprints.

2. Any visible fingerprints should be photographed with and without a scale prior to any further processing, as that may destroy a visible fingerprint.

   a. If close-up pictures are taken for comparison purposes, use the RAW format. See FSD.42.01.

   b. When burning the RAW image to CD, include a sufficient number of overall photographs to give a latent print examiner the orientation of the latent print at the crime scene or prepare a written photograph log that clearly describes the location and orientation of the latent print.

   c. If there are multiple latent prints documented via photograph, include both overall photographs on the CD and a written photograph log describing the locations of the latent prints.

C. Methods to use on non-porous surfaces (glass, metal, plastic, finished wood, etc.)

1. As a general rule, a powder should be used which will contrast with the color of the surface. Many times additional lifts can be made from prints and quite often the later lifts are superior in quality to the first lift. Rubber lifts can be utilized for making lifts on curved surfaces. Faint bloody prints on non-porous surfaces like glass can often be enhanced by powdering or with amido black. These prints should be photographed prior to dusting and chemical processing. Don’t attempt any processing of bloody prints until they are completely dry and have been photographed.

2. Never dip the brush directly into the original jar. Use a separate reservoir of powder, discarding any leftover powder and its container. If DNA evidence is or might be a consideration in the case, use a new brush(es) so as to avoid possible contamination, unless swabbing for DNA material is completed first.

3. Non-magnetic powders

   a. Equipment

      i. Latent Print Powders

      ii. Light source

      iii. Camera equipment
iv. Nylon/fiberglass brush  

v. Fingerprint tape  

vi. Glossy fingerprint card  

b. A high intensity light is invaluable in assisting in the location and photography of latent prints on certain surfaces. Side lighting the area to be printed could reveal prints that otherwise might have been overlooked. Examination of evidence for inherent luminescence can be conducted with the use of an alternate light source.  

c. Place a small amount of powder on a fiberglass brush and remove any excessive powder. An excessive amount of powder could destroy the print so tap the brush on the side of the powder jar if needed.  

d. Lightly twirl the brush over the object until the fingerprint develops. Once the print has been developed, it is recommended that the print be photographed prior to being lifted. More powder can be applied as needed, depending on the development of the latent print.  

e. The developed print is ready to be lifted. Create an anchor on your tape roll. This will give you something to hold on to that is not sticking to your gloves. Beginning off to the side of the print, anchor the tape down and then smooth the remainder of the tape over the print, working the tape toward the opposite end of the print. During this process, use your finger to prevent any creases or air bubbles from developing. Once the tape is adhered to the print, never lift the tape in an attempt to remove any creases or air bubbles.  

f. Once the tape covers the entire print, lift the tape in the same manner it was placed on the print. Begin at one end of the tape and slowly lift toward the opposite end.  

g. The color of the card should provide the greatest amount of contrast to the color of powder chosen. Example: black powder - white card.  

h. Make a small diagram on the fingerprint card to indicate the location and direction of the fingerprint recovered. Place an arrow next to the lift tape and do the same on the diagram to indicate the orientation of the lift tape on the object. Initial and date the tape. Mark the case number, location, description of the object/surface, your initials, and the date on the card.  

4. Magnetic powders  

a. Magnetic powders are useful for items in which you want to control the amount of powder placed on the object, such as cardboard or glossy paper.  

b. Apply the magnetic powder in the same manner as the black powder, except using a magnetic wand to lightly brush the powder over the object until a fingerprint has developed.  

c. Pick up the left over material by using the magnetic wand.  

d. Lift the developed print using latent tape and place it on a contrasting latent card.  

e. Place an arrow next to the lift tape and do the same on the diagram to indicate the orientation of the lift tape on the object. Initial and date the tape. Mark the case number, location, description of the object/surface, your initials, and the date on the card.  

D. Other Types of Surfaces  

1. Generally, other categories of materials encountered at a crime scene (e.g. porous surfaces, tape, etc.) will not be processed at the scene. Collect these items for further processing at the laboratory.  

E. Bloody Fingerprints  

1. Photograph the bloody fingerprint before collecting the item in RAW format. If the object cannot be collected, consider consulting with the Crime Scene Supervisor or Latent Print Supervisor to discuss which, if any, blood enhancement techniques to apply.  

F. Wet Surfaces  

1. Small particle reagent (SPR) can be used on wet surfaces. SPR is a liquid suspension of molybdenum disulfide particles which adhere to the fatty deposits left in the fingerprint. Wet Print is the brand name of the SPR product.  

a. Shake the bottle containing the SPR.  

b. Adjust the spray for a fine spray.  

c. Spray the wet surface above the area suspected to contain fingerprints.  

d. Repeat several times with a 30 second window between applications.
e. Once prints develop, photograph and allow to air dry.

f. Collect the fingerprint.

G. **Packaging of Objects for Transportation**

1. Secure items to be fingerprinted to minimize movement within the container. Do not allow adhesive materials to contact other materials.

H. **Use of an Alternative Light Source**

1. An alternative light source may assist in locating fingerprints in substances that fluoresce. Vary the filter and the wavelength as appropriate.

END OF DOCUMENT
I. Biological evidence is often in the form of liquid or dried blood, semen, or saliva. Other biological evidence that may be encountered is hair, urine, feces, bones, teeth, and other tissues. Since biological evidence may lead to the identification of a victim or suspect, it is imperative that this evidence be collected and preserved for DNA analysis.

A. Introduction: Biological evidence includes blood, other body fluids such as semen, and contact DNA that can be found at crime scenes. The use of DNA typing with its increased sensitivity and durability has heightened the need to properly collect and package biological evidence to prevent any source of cross-contamination. Proper steps must be used to ensure that there is no direct contact between the sample and the person collecting the sample and between samples of different origins.

B. Preliminary Considerations

1. The crime scene should be photographed prior to any evidence collection and an individual photograph of the area sampled should be taken where appropriate. The area collected should be designated such that the area can be related back to the item collected.

2. When searching for a crime scene for blood, the analyst should first use a high intensity light. Diluted blood will often leave a brownish stain. Blood may flow into floorboard cracks, carpet padding, and behind baseboards. In such cases, blood can be located with a high intensity light source and presumptive blood testing can be performed. Photographs and documentation should be made prior to any testing, collection, or altering of the crime scene. There are a variety of techniques available to the analyst to assist with locating biological evidence, including the following: visible searching, using an alternate light source, and general swabbing using appropriate presumptive tests.

C. General Collection Requirements

1. Gloves used for evidence collection must be taken from a clean container (e.g. directly from the box or a clean secondary container).

2. To prevent contamination, gloves must be changed between handling evidence and handling non-sterile scene supplies and tools (e.g. pen, posse box, etc.).

3. Items sharing a likely common origin do not require a glove change (e.g. four fired cartridge cases on the ground next to each other).

4. A mask will be worn while collecting evidence. Detectives will be given a mask if they are near evidence.

5. Additional PPE is recommended based on scene conditions (Tyvek suit, shoe covers, hair nets).

6. If disposable tools are not available, any tools used for collection must be sterilized with a bleach solution before use.

D. General Swabbing Procedures

1. Wear proper PPE (e.g. lab coat, gloves, and mask) to prevent possible contamination of the evidence. Change gloves between handling different items of evidence.

2. Moisten the swab(s) using sterile water.

3. Rub the swab(s) rigorously over the target area. Optimally, use the entire surface area of the swab to collect as much material for potential biological testing.

   a. If necessary, for non-porous surfaces, use a dry swab to collect the residual moisture from the target area.

   b. At times using two (simultaneous) swabs will be necessary depending on how textured the substrate is or how torn the swab becomes during collection.

4. If collecting contact DNA swabs from unfired cartridges or fired cartridge cases, collect one wet and one dry swab from each group of cartridges or cartridge cases. If necessary, comparative evidence unit staff may be consulted to determine groups based on class characteristics. For large groups of cartridges or cartridge cases...
(over 10), multiple pairs of wet and dry swabs may be needed. Package the swabs from a single group together in one envelope.

5. For stained areas, a substrate control may be collected. Repeat the above procedure on a visually unstained area.
   a. A substrate control is not necessary when evidence collection is for contact DNA.

6. Package the swab in a properly labeled evidence envelope and allow it to dry completely.

7. Swabs from different items or locations must be packaged separately.

8. While collecting a sample, do not mix adjacent drops of blood or other biological material, as they may not be from the same source. If the stains to be collected are extremely small and might not generate a DNA profile, adjacent drops may be combined.

9. Record in the case notes the lot number of the sterile water that was used.

E. Collection of Movable Objects

1. If the item containing the biological sample can be collected in its entirety, collect the entire item. Place the item in an appropriately-sized porous package such as a brown paper bag or envelope. Use a separate bag or envelope for each item.
   a. Label the exterior of the package with the case number, date, item number, description, and initials.

2. Do not use plastic bags for long-term storage; however, saturated items may need to be transported to the laboratory in plastic for drying (see below).

F. Heavily Bloodstained Clothing

1. A piece of clean butcher paper can be placed around the clothing item to minimize contact between different bloodstains when the clothing is packaged into a brown paper bag.

2. Layer with butcher paper to preserve bloodstain patterns and prevent cross contamination as appropriate. Example: a piece of butcher paper on the exterior back of a shirt, a piece on the interior of the shirt, and a piece on the exterior front of the shirt).

3. Very wet items may soak through a paper bag and contaminate adjacent items. These items may be placed into a plastic bag for transport only. Remove the item from the plastic bag as soon as possible at the laboratory and place it in a drying cabinet. The transport packaging (paper and plastic) may have dried blood and additional evidence. Retain the transport packaging and place it within another container after drying.

G. Collection from Large Objects or Non-Movable Objects

1. Whenever possible, collect the biological stain by cutting it from the object using a disposable scalpel or razor blade. Once removed, place the item into an appropriately-sized envelope or brown paper bag. Collect sample of an unstained area near the stain to be used as a substrate control. Note, if a larger area than just the stain is cut, the stain and a substrate control can be collected simultaneously.
   a. Package into a suitably sized package.

2. If the biological stain is on an object such as a wall or concrete flooring and cannot be removed, then collect a swab of the biological material.

H. Collection of Used Condoms

1. If fluid is present, collect a swab from the inside of the condom and a second swab from the outside of the condom and package separately. Note, if there is a large amount of fluid, use multiple swabs to obtain as much fluid as possible. Place the condom into a conical tube.

I. Use of an Alternative Light Source

1. An alternative light source may assist in locating biological evidence that fluoresces or absorbs light. Vary the filter and the wavelength as appropriate.

J. Packaging: Biological evidence should be packaged in paper (porous) products. Proper collection includes preventing contamination from extraneous sources, such as crime scene personnel and other samples from the crime scene. Proper preservation ensures that degradation due to bacteria, humidity, high heat, and other environmental factors is limited. The following order of preference for collection of biological evidence should be considered:

1. Collect the entire item on which the evidence is located.

2. Cut the evidence from its location. This is a reasonable course of action when dealing with large furniture, area rugs and carpet, drywall, wood floor, door, and window frames, etc.
3. Swab the evidence. Moisten a sterile cotton swab using only enough sterile water to collect the sample. Rotate the tip of the swab through the sample until it appears saturated with sample and the stain appears collected. Concentrate the sample on the tip of the swab. Always consider collecting multiple swabs if sample quantity permits. Swabs from the same sample should be packaged together.

4. Wet biological evidence should be dried prior to being placed into a storage location. It may be necessary to place wet biological evidence into plastic packaging for transportation purposes; however it should be removed from the plastic as soon as possible, allowed to dry, and then packaged in appropriate paper (porous) packaging.

5. Visible trace evidence should be collected from these items before they are bagged and transported. In the case of liquid biological evidence, saturate several cotton swabs and allow to dry. Note: A substrate/control swab of a stain-free area should be collected whenever possible.

K. **Presumptive Testing:** The use of presumptive tests may be useful to the crime scene responder to help identify blood at crime scenes. A positive reaction does not confirm the presence of blood, merely the presumptive presence, because a variety of biological and chemical substances may react with the presumptive test. Prior to each scene use, the test must be checked with a positive and negative control.

1. **Hemastix**
   a. **Blank:** Add one drop of sterile water onto a clean swab. Press the swab against the Hemastix strip. No immediate color formation should occur. If one does, use a new source of sterile water and repeat the test. If an immediate color formation still occurs, discard the Hemastix bottle and use a new one.
   b. **Known Blood Standard:** Add a small drop of distilled water to the end of a clean swab or to the tip of a folded piece of filter paper. Swab a small portion of the known blood. Press the swab against the Hemastix strip. The immediate formation of a green color should result. This should be done prior to each testing session to ensure the strips are working properly.
   c. **Test:** Add a small drop of distilled water to the end of a clean swab or to the tip of a folded piece of filter paper. Swab a small portion of the suspected bloodstain. Press the swab or filter paper against the Hemastix Reagent Strip. Repeat the procedure on an unstained area of the substrate when possible.
   d. **Interpretation:** The rapid appearance of a green color, typically under 5 seconds, indicates the possible presence of blood. A known bloodstain and reagent blank must be tested each session Hemastix is used to demonstrate the reagents are working properly. The Hemastix Reagent Strips are sensitive, but not very specific. The positive color test alone should not be interpreted as indisputable proof of the presence of blood.

2. **Ortho-Tolidine (O-Tol) Presumptive Test for Blood**
   a. **General Information:** A suspected bloodstain can be examined with a quick, sensitive, but non-specific presumptive test to determine if it could be blood. These tests depend upon the catalytic peroxidase-like activity of the heme group of hemoglobin. Therefore, this reagent will react with blood from animals as well as humans. Do not place reagents directly on the evidence. Sample the evidence with a cutting or swabbing. In the absence of blood, the two reagents will begin to react with each other and give a pink color with time. A description of the biological evidence should be documented (e.g., color, pattern, size, wet, clotted, damp, or dry).
      i. Hemoglobin and a number of its derivatives catalyze the oxidation by peroxide of a number of organic compounds to yield colored products. **Since color catalytic tests are not specific, a positive color test alone should not be interpreted as positive identification of blood.** However, a negative result is indicative of the absence of detectable quantities of blood.
      ii. Color development before the addition of hydrogen peroxide may be due to the presence of a chemical oxidant. Several substances will give a positive color reaction for these presumptive tests.
      iii. Vegetable peroxidases will frequently show positive color reactions. Plant peroxidases react similarly to blood in catalyzing this reaction. However, they are generally associated with plant tissue and can be visually distinguished from blood. In addition, they tend to be unstable over time, losing their ability to oxidize the ortho-tolidine reagent.
      iv. Many substances of animal origin may contain blood (even in trace amounts) and will therefore give positive presumptive tests. These substances include pus, saliva, and mucous.
      v. A bloodstain control and unstained control must be tested prior to testing unknown or suspected blood samples.
   b. **Reagents:** prepared by the Forensic Biology Unit
   c. **Blank:** Add one drop of sterile water onto a piece of filter paper or a clean swab. Add one drop of o-tolidine working solution and then a drop of 3% hydrogen peroxide onto the filter paper or swab. No
immediate color formation should occur. If one does, use a new source of sterile water and repeat the test. If an immediate color formation still occurs, obtain another source of the chemicals.

d. **Known Blood Standard**: Transfer a small portion of the known blood onto a piece of filter paper or swab (may be slightly moistened with distilled water, if needed). Add one drop of o-tolidine working solution and a drop of 3% hydrogen peroxide onto the filter paper or swab. The immediate formation of a blue-green color should result. This should be done for each testing session to ensure the reagents are working properly.

e. **Test**: Transfer a small portion of the suspected bloodstain onto a piece of filter paper or onto a swab that has been slightly moistened with distilled water. Place one drop of the o-tolidine working solution onto the piece of filter paper or the swab followed by one drop of 3% hydrogen peroxide. The immediate formation of a blue-green color indicates the presence of blood. Repeat the procedure from a visually unstained area of the substrate, if possible.

f. **Interpretation**: The rapid appearance of a blue-green color, typically under 5 seconds, indicates the presence of blood. A known bloodstain and reagent blank must be tested each session the o-tolidine reagents are used to demonstrate the reagents are working properly. Catalytic blood tests are very sensitive, but not specific. The positive color test alone should not be interpreted as indisputable proof of the presence of blood. The major sources of false positives are chemical oxidants and vegetable peroxidases. A color reaction which occurs after the addition of the o-tolidine solution, but before the addition of 3% hydrogen peroxide, indicates a non-specific reaction caused by a chemical oxidant.

g. **Notes**: Record the lot number of the reagents used, their reaction with a known positive and a known negative blood, in the case notes.

END OF DOCUMENT
I. Firearms evidence can help to identify which gun fired a particular bullet or cartridge case and the distance from which a weapon may have been fired (muzzle to target distance). It can also potentially be used to test for fingerprints or DNA and determine who may have handled the firearm or cartridge case. All firearms must be rendered safe before transportation. If the firearm is jammed or the crime scene responder is unable to render it safe, then a firearms examiner should be consulted.

A. Introduction: Firearms evidence can include firearms, ammunition, discharged cartridge cases, projectiles, fragments, bullet impact marks, and gunpowder residue.

B. Safety: The primary concern during the collection and packaging of a firearm is safety. Always handle a firearm as if it is loaded and keep it pointed in a safe direction. Preservation of evidence that may be present on the firearm (e.g., blood, trace evidence, latent prints) should be assessed prior to packaging the evidence. Trace evidence like hairs or fibers should be documented at the scene and collected prior to packaging the firearm.

1. In the rare circumstance that a firearm cannot be unloaded safely at the scene, engage any active safeties (if present and possible), secure the hammer (if present and possible), and place in a cardboard box for careful transport to the laboratory. Mark the box as "loaded" and clearly indicate the muzzle direction on the box. Always position the muzzle end of the box in a safe direction while transporting.

2. Never move a firearm by inserting an object inside the barrel or trigger guard. This is unsafe and can damage potential evidence. Minimize handling because it is possible to recover latent prints from firearms and ammunition.

C. Revolvers: The following guidelines should be used when handling a revolver:

1. Photograph the firearm prior to handling or collecting it.

2. When collecting a revolver, pick the firearm up by the textured surface on the grips or by the edges of the trigger guard (with clean gloves).

3. Note the position of the hammer.

4. If the revolver is cocked (hammer back), consider placing an object between the hammer and the frame for added safety before carefully letting the hammer down by manipulating the trigger while holding the hammer spur.

5. Mark the position of the cylinder on each side of the topstrap prior to opening the cylinder. Index the number of chambers and document the brand and condition of the ammunition in each chamber (the part of the frame directly above the cylinder).

6. Mark the cartridge or cartridge case under the firing pin as #1 and mark the remaining cartridge cases in the direction of rotation for the cylinder. The chambered cartridges should be photographed prior to removal.

7. Document in case notes the location of the chambered live cartridges or discharged cartridge cases.

8. Individually remove the cartridges/cartridge cases from the revolver and package each one separately in an appropriately numbered envelope or paper bag to prevent alteration or obliteration of microscopic markings, latent prints, and to reestablish how the revolver was loaded.

9. Place the firearm in a cardboard box or other appropriate container.

D. Semiautomatic Pistols

1. Photograph the firearm prior to handling or collecting it.

2. When collecting a semiautomatic pistol, pick the firearm up by the textured surface on the grips or by the edges of the trigger guard (with clean gloves).

3. Carefully disengage the magazine and remove it from the firearm.

4. Manipulate the slide to clear the chamber.
5. Package any cartridge that was found in the chamber.
6. Any cartridge(s) found in the magazine can either be inventoried on scene or at the laboratory.
7. Cartridges may be numbered as they are removed from the magazine if relevant to the case.
8. Place the firearm in a cardboard box or other appropriate container.

E. **Rifles and Shotguns**
   1. Photograph the firearm prior to handling or collecting it.
   2. When collecting a rifle or a shotgun, pick the firearm up by the textured surface on the stock or by the edges of the trigger guard (with gloved hands).
   3. Note the position of the bolt and any safeties.
   4. Remove the magazine from the firearm if possible.
   5. Open the action and visually check the chamber for a fired or unfired cartridge/shotshell, remove any cartridge/shotshell, document the brand and condition (fired or unfired) and package it in an envelope or paper bag.
   6. Package any cartridge that was found in the chamber.
   7. Place the firearm in a cardboard box if possible or other appropriate container.

F. **Cartridges, cartridge cases, bullets, and fragments**
   1. Collect fired cartridge cases, unfired cartridges, bullets, and fragments found at a scene and package them into coin or soil envelopes or other appropriate containers.
      a. Mark the exterior of the package with the item number, date, case number, description, and initials of who collected it.
      b. Groups of cartridge cases may be packaged together in unusual circumstances (e.g. more than 20 cartridges cases fired from a single area).

G. **Shot and Shot Wadding**
   1. Recover as much of the shot (pellets) material as possible.
   2. Pellets found in the same location may be packaged together.
   3. Package pellets and wads found at different locations separately.
   4. Mark the container with the appropriate information including item number, case number, date, description, and initials of who collected it.
   5. Collect all the wadding material discovered at the scene.
   6. Place each into separate containers and mark with the appropriate information.
   7. Package the wadding material collected from different locations into separate containers.
   8. If present, collect any shot buffer (also known as “Grex”) in the same manner as the wadding. Shot buffer is typically a white granular material and will most likely be found somewhere between the shooting position and the target.

H. **Powder Patterns on Clothing:** When a firearm is discharged, unburned and partially burned particles of gunpowder, gas, soot, metallic particles stripped from the bullet, and vaporized metal from the bullet are propelled out of the barrel along with the bullet toward the target. If the muzzle of the weapon is sufficiently close, these products will be deposited onto the target. It is the distribution of gunpowder particles and other discharge residues around the bullet hole that permits an assessment of the distance from which a firearm was discharged. The clothing from a shooting victim should be carefully preserved so as to prevent damage or disruption to powder residues deposited around bullet or shotshell component holes. The cutting or tearing of clothing in the area of these holes must be avoided as the clothing is being removed. Each item of clothing should be packaged separately in paper. If it is necessary to fold an article of clothing, place a piece of paper over the article to prevent contact and reduce the possibility of transferring residues to other areas.
   1. Any article of clothing with a powder pattern should be packaged to protect the area that might have a powder pattern:
      a. Place a piece of butcher paper inside the garment and button the garment, if applicable.
      b. Cover the article of clothing with another piece of butcher paper.
c. Place a piece of butcher paper on the back of the garment.
d. Fold the butcher-paper wrapped article of clothing into a paper bag.

I. Trace Evidence, Including DNA, on Firearms

1. Trace evidence that is readily visible at the scene and may be easily lost in transport should be photographed in place, removed prior to packaging, and placed in a separate envelope or appropriately-sized package.

2. Clearly label the packaging with the source of the evidence as well as the date, case number, item number, description, and the initials of who collected it.

3. Collect contact DNA swabs from appropriate surfaces as needed.
   a. Use one or two swab(s) for the grips, one swab for the trigger, and one swab for the slide including the front sight tip. Other areas should be swabbed if commonly handled by the operator (e.g. magazine, charging handle, forestock, etc.).
   b. Reference CS.08 for swabbing procedures.

J. Trajectory Reconstruction

A trajectory reconstruction of a crime scene may assist with the determination of the sequence of events: the orientation and location of the individuals involved in the shooting incident, the position of intervening objects, and the sequence of the shots fired into the windshield of a vehicle.

1. Equipment
   a. Cameras
   b. Tripod
   c. Trajectory rods
   d. String
   e. Protractor/Angle finder and plumb bob
   f. Laser
   g. Small mirrors

2. Procedure: The following guidelines should be used when documenting trajectories:
   a. Photograph the bullet hole or defect prior to any attempt to determine the trajectory (overall, intermediate, and close-up, with and without scales).
   b. Document the location of the bullet hole in your notes (sketch and measurements).
   c. If applicable, collect trace evidence.
   d. Determine the direction of fire, if possible (entrance vs. exit)
   e. Carefully place a trajectory rod through the entrance hole (and associated exit hole or terminal defect, if applicable). Place the angle finder along the top of the trajectory rod and record the measurement of the vertical impact angle relative to the horizontal plane. Alternatively, a protractor can be used to determine the impact angle. With the protractor in the vertical position, place the center of the flat edge flush with the one side of the bullet hole and read the angle measurement on the protractor from the same side of the bullet hole. From a side view, determine the vertical impact angle with the inclinometer. It is important to document whether the measured angle is in relationship to the target surface or the horizontal/vertical plane. This can be documented by a description or a sketch, and is left to the crime scene responder's discretion.
      i. If an exit hole or terminal defect is not present and the medium is not sufficiently thick to ensure the trajectory rod is creating a true representative of the trajectory, then the trajectory should not be determined.
   f. A laser can be attached to the end of the trajectory rod to project/extend the trajectory in either direction.
   g. Top down and side photographs are recommended for each trajectory rod.
      i. Top-down photographs should be taken orthogonal to the horizontal plane.
      ii. Side photographs should be taken orthogonal to the trajectory rod.

K. Ejection Pattern Analysis

1. The laboratory does not routinely offer ejection pattern analysis. However, the crime scene responder may be asked questions by counsel in court. Because the crime scene responder has training in this area and experience
from responding to crime scenes, he or she may opine about ejection patterns after explaining certain critical limitations.

2. Limitations on ejection pattern analysis
   a. Firearm
   b. Ammunition
   c. Shooter's grip position
   d. Movement of the shooter
   e. Shooter's position (e.g. in a car)
   f. Material and slope of the surface the cartridge cases land on
   g. Climatic conditions
   h. Subsequent actions by the victim or suspect
   i. Subsequent actions by emergency personnel

3. If these limitations are acknowledged, it may be appropriate for the crime scene responder to answer questions about where the shooter could, or sometimes more importantly, could not have been. The crime scene responder will be conservative for any opinions.
I. The value of any toolmark evidence is to link a particular tool to a particular crime scene and potentially the suspect. A toolmark is created by a harder object (the tool) coming into contact with a softer object (the substrates), leaving a striated or impressed mark from the tool’s working surface. A toolmark can be created by a scraping motion (crowbars, screwdrivers), shearing/pinching action (scissors, wire cutters, and tin snips), or perpendicular force acting against the receiving object (hammers, punches, and some gripping tools) with an object or surface, leaving a mark.

A. General Documentation for Toolmarks
   1. Take overall, medium range, and close-up photographs of the toolmark with direct and oblique lighting (as appropriate), both with and without a scale and perpendicular to the toolmark.
   2. The close-up photographs may be used for comparison and should be taken in RAW format.
   3. Use exposure settings that will ensure sufficient depth of field in the photograph of the toolmark.
   4. Measurements should be taken to document the toolmark in relationship to the ground or other fixed objects. When possible, collect the actual toolmark. This may require collecting part of a door frame or other large object. If this is not possible, a Mikrosil or Forensic-Sil cast may be made.

B. Collection of the Toolmark
   1. Collect the item containing the toolmark if possible. Package to protect the toolmark from harm, loss, or cross contamination of any trace evidence that may have been left in the toolmark. If trace evidence is fragile and could be lost, considering without it prior to packaging the marked surface.
   2. In some cases, the toolmark can be removed from the object by cutting it out. If the toolmark has to be cut from an object, do not cut across the toolmark itself, but cut in such a manner to preserve the entire toolmark. Document the original orientation of the cut piece containing the toolmark relative to the whole item it is being cut from and mark the cut piece accordingly so this information is clear to whoever may examine it at a later date. Package to protect the toolmark from harm or the loss of any trace evidence that may have been left in the toolmark.
   3. Mark the packaging with the appropriate information regarding item number, case number, and the initials of individual collecting the toolmark.

C. Casting the Toolmark
   1. If the item containing the toolmark cannot be removed and the toolmark itself cannot be cut away from the item, a cast of the toolmark is created. Cast the toolmark using Forensic Sil, Mikrosil, or other suitable casting material by following the casting material directions. Treat the final cast according to the manufacturer’s instructions and place in a suitable container once it is dried and removed from the toolmark.
   2. Do not package silicone-based casts (i.e. Forensic Sil, Mikrosil) in plastic bags or containers that may come in contact with the surfaces of the cast during storage.
   3. If possible, mark on the casting material itself (or the paper backing) and include the item number and orientation of the toolmark.

D. Collection of Tools
   1. Collect any tool, especially those which appear recently used and which, based on their size, shape, and/or tool action, could have made the toolmarks in question. Each tool collected should be packaged separately and care should be taken not to disturb any trace evidence that might be present on the tool. If trace evidence is visible on the tool and may be lost during transport, the trace evidence should first be photographed in place, carefully collected, and placed in an appropriately-sized container.
a. Mark the container with where the trace was removed from, a description of the trace material, item number, date, and person collecting it.

2. When removing any trace evidence from a tool's surface, do not contact the tool's working surface with a metal tool (such as forceps being used to remove the trace evidence) as this may leave marks on the tool surface.

3. DNA evidence located on the tool’s handle can also be collected either at the scene or at the laboratory. If DNA evidence collection is warranted, then the tool edge as well as the handle must be packaged in such a manner as to prevent contamination or loss.

II. Impression evidence can provide the basis for determining whether a particular person, shoe, tool, or other object produced a mark on a substrate. The impression can record both class and individual characteristics. Impressions should be documented by photographs with oblique light and collected with an appropriate method. The term “impression” in this policy is intended to include two dimensional imprints, such as imprints in dust.

A. General Documentation for Impressions

1. All impressions should be photographed with direct and oblique lighting, with and without a scale, and perpendicular to the impression.

2. The close-up photographs may be used for comparison and should be taken in RAW format.

3. Adjust camera settings to ensure sufficient depth of field in the photograph for the impression.

B. Electrostatic dust lifts (ESDL) use a device that creates a static charge on a lifting film (mylar), causing a dust impression to transfer from the substrate it is deposited on to the film. The result is a same-sized transfer of the impression that may be collected. The device will work on both porous and non-porous substrates, but works best on dry dust impressions on relatively clean surfaces. The technique is not successful with wet transfers or dry transfers that became wet or damp prior to lifting. The electrostatic lifting process is non-destructive and is normally the first method used when attempting to lift an imprint. Note: bright oblique lighting is helpful to locate dusty imprints (e.g. shoeprints) on a dark or patterned surface.

1. Equipment
   a. Electrostatic dust print lifter
   b. Lifting film
   c. Fingerprint roller

2. Procedure
   a. Take examination-quality photograph(s) of the impression prior to any lifting attempts.
   b. Place a piece of clean plastic electrostatic lift film over the area to be examined. The black surface of the film is in contact with the surface to be examined.
   c. Place the ground electrostatic plate near the surface being examined. The most effective position of the ground plate is when it is in maximum contact to a surface adjacent the impression surface.
      i. For impressions on moveable objects, such as newspapers, rugs, etc., the best position for the ground plate would be under the impression with the metal side up.
      ii. For impressions on immovable objects, such as vinyl flooring or a wall, place the ground plate next to, but not touching, the object.
      iii. For impressions on metallic objects, such as a vehicle door, the device may be grounded directly to the metallic object.
   d. Place the device on the edge of the metal surface of the lifting film so the electrical contacts make contact with both the grounding plate and lifting film. Never slide the lifting film on the impression surface.
      i. The film has two sides: a metallic silver side and a black side. The black side should be facing the impression (face down) and the silver side away from the impression (face up). The lifting film must be larger than the impression to ensure a full transfer. Mark the orientation of the film.
   e. Turn on the voltage. Start at a lower voltage setting, and increase voltage slowly as needed.
   f. Use the rubber roller to remove any trapped air pockets under the film. When using a fingerprint roller to eliminate air bubbles in the lifting film, avoid shifting or excessive pressure that may damage the impression.
   g. Reduce the voltage, turn off the power, and wait 5 seconds to allow the static charge to dissipate.
h. Mark the lifting film before removing it from the impression surface to allow for the orientation of the impression to be recreated. This may be impossible to do if the film was removed from the surface without orientation marks, clear photographs, or a supporting diagram.

i. Pick up the lift film, and check it for possible imprints. **Note:** bright oblique lighting is helpful and multiple lifts can be made of the same area. If the first lift removes extraneous dust present on the substrate, subsequent lifts may improve imprint resolution.

   i. Not all dry impressions can be successfully lifted using ESDL. Attempts to lift dust prints on dirty backgrounds will cause both the dust print and dirty background to lift together. Subsequent lifts should be attempted to see if they would be successful.

   ii. Subsequent lifts from the same impression must be numbered or otherwise labeled to distinguish which was first, second, etc. The case record must have some statement addressing the quantity and description of impressions located, along with which ones were lifted. This may be aided with, but not replaced by photographs.

j. If imprints are present, secure the lift film to the inside of a dust-free container such as a clean, unused file folder or pizza-sized box. Alternatively, the lift film may be rolled (dust-side inward) and secured with a small piece of tape. However, if this method is used, the film should not be unrolled and re-rolled again before it is examined and photographed.

k. As soon as possible, photograph the imprint present on the film under controlled conditions at the laboratory (the imprints are fragile).

   i. **Note:** The imprints on the film are reversed from their orientation on the original surface they were lifted from.

l. Record the orientation, case number, date, and initials on the film, its packaging, and in the notes. It can also be helpful to take a photograph of the overall area before lifting the film to show its relationship to the scene.

m. If no imprint is lifted, other enhancement techniques can be applied.

3. Safety

   a. As a precaution the electrostatic dust print lifter should not be operated by persons with pacemakers.

   b. Fail to discharge the lifting film will resulting in a static electricity shock to the analyst touches the film. To discharge the surface, allow devise to sit in contact with the lifting film, with no voltage, for at least 5 seconds after the ESDL voltage is turned off. It is possible to receive electrical shocks from the lifting film, the ground plate, the metal probe, and a metallic impression surface. Such shocks will be avoided by not touching any of these parts when the current is on and by allowing the probe to discharge after use. Do not allow the lifting film to come into contact with the grounding plate while the ESDL is on – this will cause arcing and the device will not work properly.

   c. If arcing occurs between the film and the ground, the power is too high or part of the film is touching or too close to the ground plate.

C. Gel Lifting: uses a low-adhesive gelatin layer to lift of traces of fingerprints, footprints, and marks in dust from many surfaces, including porous materials such as paper or cardboard. Gel lifts are available with three different colored backings (clear, white, and black) and have a transparent, colorless polyester film that protects the gelatin layer. The backing color is chosen to best contrast with the color of the target impression or fingerprint. The gelatin layer will melt between 400 - 450 Celsius or 1040-1130 Fahrenheit. Lifts may be stored at room temperature.

1. Equipment

   a. Gelatin Lifters (various sizes and colors are available)

   b. Fingerprint Roller

2. Procedure

   a. Take examination-quality photographs (with and without a scale) of the impression prior to any lifting attempts.

   b. Choose the color of the gelatin lifter based on what will result in the best contrast between the target impression and the backing color. Black often works well for dusty shoe impressions, while a fingerprint developed with black fingerprint powder may best appear on a white background. Attempts to lift dust prints on dirty backgrounds will cause both the dust print and dirty background to lift together. Subsequent lifts should be attempted in this case; the quality of the print may be improved with subsequent lifts.

   c. Cut the gelatin lifter to a size just larger than the target impression. Label the back of the lifter or cut a notch in a corner and document the orientation, position, and location of the lifter.
d. Remove the protective plastic film and let the gel rest momentarily to reduce stretch from lifting the plastic film.

e. Place the surface of the gel in contact with the surface to be examined. Never slide the gelatin lifter across the surface with the impression.

f. With the rubber roller, roll the back surface of the gel support film to ensure complete contact of the gel with the surface to be examined. When using the fingerprint roller to eliminate air bubbles in the lifter, avoid shifting or excessive pressure that may damage the impression.

g. After the lifter has been smoothed over the entire surface of the impression carefully pick it up starting at the corners and examine it for possible imprints (oblique light is helpful).

h. Place it on a horizontal surface with the gelatin layer up and secure the lifter by the edges or corners in the bottom of a flat cardboard box to protect the exposed gelatin layer. Note: multiple lifts (using a new gel lifter each time) can be made of the same area. If the first lift removes extraneous dust that might be on the substrate, subsequent lifts may be necessary to pick up the imprint.

i. Photograph the imprint present on the gel as soon as possible. These imprints are fragile and may be absorbed into the gel over time. The rate of fading depends on the storage temperature (cooler is better) and the material of the impression.

j. Record the orientation, case number, date, and initials on the gel, on its packaging, and in the notes.

3. Interpretation

   a. Lifted prints can easily be viewed and photographed with oblique lighting. Powdered prints can be lifted with rubber-gelatin lifters. With the transparent lifters, a positive image can be obtained by photography through the transparent backing.

D. Dental Stone: is a casting technique that is used to collect three-dimensional impressions. Three-dimensional impressions are those that have a significant depth to them, in addition to the length and width of the impression. Commonly, they may be found in soil, sand, mud, or snow. The detail within the impression may vary according to the substrate.

1. Equipment

   a. Dental stone
   b. Water Bucket or plastic bag
   c. Stir stick or spoon
   d. Tongue depressor
   e. Adjustable metal or wood forms
   f. Plastic or metal tray

2. Procedure

   a. Take examination-quality photographs of the impression prior to casting.
   b. Set a casting frame around the impression to contain the casting mixture, if appropriate. Casting frames are usually only needed on sloped surfaces.
   c. Mix the dental stone powder with water to prepare a mixture according to the manufacturer’s instructions. For smaller impressions, this is best done in a plastic press-lock bag using hand kneading; for larger impressions, a five gallon plastic bucket may be used with a paint stirrer or hand drill with mixing attachment. The mixture should have a consistency similar to pancake batter, usually 10-12 oz water per 2 lbs of pre-measured dental stone.

   i. The reaction of dental stone with water is exothermic. Once a dental stone mixture has hardened, it is not reversible. Use the mixture quickly after it is mixed or it may harden in the mixing container. Thicker mixtures and warmer temperatures will cause hardening more quickly compared to thinner mixtures and colder temperatures.
   d. Gently direct the flow of the mixture into the cavity of the impression. Do not pour the mixture into the impression—start pouring at the edge of the impression and then pour into the mixture as the mixture flows across the impression. A piece of cardboard or plastic held between the pouring container and the impression can dissipate the force of the flowing mixture and help distribute the mixture in the cavity of the impression.
e. If the impression sits on a slope, pour the mixture from the bottom of the impression towards the top. This will help ensure that any gravity-induced flow of the mixture does not disturb the detail in the impression.

f. Allow the dental stone to set. Note: dental stone casts can be made through shallow standing water as the dental stone mixture, being more dense than water, will displace any water in the impression.

g. Record the case number, date, initials, and compass orientation by scratching them into the back (non-impression) side of the cast before it has completely dried.

h. Take orientation (overall) photographs at the scene before the casts are removed for possible reference as needed.

i. After the cast has completely dried, remove it and place it in a cardboard box or other suitably sturdy packaging for collection. Leave any soil that may adhere to the cast intact until it can be safely and thoroughly removed at the laboratory. All cast cleaning will be done in the laboratory as part of the laboratory examination by a trained analyst.

E. **Mikrosil:** is a casting technique that is used to collect three-dimensional impressions. Three-dimensional impressions are those that have a significant depth to them, in addition to the length and width of the impression. Commonly, they may be found in soil, sand, mud, or snow. The detail within the impression may vary according to the substrate.

1. **Equipment**
   a. Mikrosil
   b. Tongue depressor
   c. Mixing board

2. **Procedure**
   a. Take comparison-quality photographs of the impression prior to casting.
   b. Mikrosil is mixed per the manufacture’s instructions and applied/worked into the impression with the aid of a tongue depressor. Once the Mikrosil mixture has hardened, it is not reversible. Use the mixture quickly after it is mixed or it may harden and not flow evenly.
   c. The required amount of Mikrosil will vary depending on the size of the impression to be cast, therefore, variations are expected.
   d. Once cured (rubbery texture) it can be gently pulled from the impression. Note: A light misting of glass cleaner (e.g. Windex) can be first applied to the surface to act as a release agent.
   e. Label the back (top surface) of the cast with identifying markings. Orientation of direction is often also useful and should be recorded. Case record must have some statement addressing the quantity and description of impressions located, along with which ones were cast.
   f. Do not clean out debris that is part of the impression or was present when the impression was made.

F. **Forensic-Sil:** is a casting technique that is used to collect three-dimensional impressions. Three-dimensional impressions are those that have a significant depth to them, in addition to the length and width of the impression. Commonly, they may be found in soil, sand, mud, or snow. The detail within the impression may vary according to the substrate.

1. **Equipment**
   a. Forensic-Sil gun
   b. Cartridges (brown or gray typically)
   c. Mixing tip

2. **Procedure**
   a. Place the cartridge in the gun, mixing tip on the cartridge, and pull the trigger to force the two components to mix and extrude through the tip. Deposit Forensic-Sil onto surface to be cast.

III. **Chemical and physical enhancement techniques are used to increase the detail and contrast between an impression and the substrate.**

A. **General Information**

1. The first consideration when deciding to use chemical enhancement techniques is whether the substrate containing the imprints can be safely removed from the scene for laboratory processing. Laboratory processing is much preferred since it will eliminate safety concerns regarding use of hazardous chemicals at the scene, as
well as make the processing much more efficient. Preservation of the imprint without damage is the main concern. If the imprint cannot be collected intact, then processing at the scene should be considered.

2. Sequential processing should be considered before using any chemical dye stain. DNA evidence, trace evidence, and any other type of physical evidence that could be lost or altered should be collected before processing. As with all imprints, the surface of the substrate affects the potential success of producing a useable imprint for comparison. Smooth and non-porous surfaces, such as tile, Linoleum, glass, painted finishes, and most counter tops are ideal surfaces.

3. Chemical enhancement techniques may interfere with subsequent DNA analysis; therefore, treat these techniques as being potentially destructive to the evidence. These techniques may permanently stain the substrate material and it may be impossible to restore the item back to its original condition.

4. When using fingerprint powder, never dip the brush directly into the original jar. Use a separate reservoir of powder, discarding any leftover powder and its container. If DNA evidence is or might be a consideration in the case, use a new brush(es) when dusting separate items so as to avoid possible contamination, unless swabbing for DNA material is completed first.

B. **Leuco crystal violet (LCV)** is a catalytic test for blood. When LCV and hydrogen peroxide come into contact with hemoglobin or its derivatives, a violet colored dye (crystal violet) is formed. The formulation is a clear solution containing the fixative 5-sulphosalicylic acid.

1. **Formula**
   a. Dissolve 10 g of 5-sulphosalicylic acid in 500 ml of 3% hydrogen peroxide
   b. Add 4.4 g sodium acetate
   c. Add 1.1 g leuco crystal violet
   d. If LCV crystals are yellow instead of white, do not use (yellow crystals indicate they are old and the solution will not be effective). LCV will stay active for several months at room temperature. It is best stored in amber glassware since the solution is light sensitive. The reactivity of the solution may be further extended by refrigeration.

2. **Procedure**
   a. Take examination-quality photographs of the impression before (if impression is visible) and after enhancement.
   b. Being a colorless solution, LCV is particularly useful for spraying on large floor surfaces, where faint or latent bloody impressions need to be enhanced or developed.
   c. The solution may be applied by spraying with an aerosol sprayer or cascading the liquid over the impression with a squirt bottle.
   d. Surfaces like tile or wood floors, where LCV has pooled or beaded, may be rinsed with water approximately two minutes after the reagent has been applied.
   e. Carpeted areas or areas which have absorbed the LCV need not be rinsed. However, it should be rinsed from non-porous surfaces to avoid spotting when the residual droplets of LCV dry.
   f. Should the enhancement occur outdoors or areas exposed to intense light, the impression should be photographed as soon as possible since photo-ionization of the dye may occur, creating a violet background.
   g. LCV luminesces and can be photographed and viewed under various wavelengths of ultraviolet (UV) and infrared (IR) light.
   h. LCV treatment can be followed with Amido Black should additional contrast be needed.

C. **Amido Black** (also known as Amido 10B or Naphthalene Black) is an enhancement technique for use on protein impressions, including blood. It reacts with proteins present causing a blue-black color result, typically increasing the contrast of the impression on the substrate. It is especially useful enhancement technique for nonporous surfaces such as glass, plastic, vinyl, and finished wood. It may also be applied to porous surfaces, but extensive background staining may occur.

1. **Formula** (aqueous formula with fixer added)
   a. Mix by stirring and combining the below ingredients in the following order:
      i. 500 ml distilled water
      ii. 20 g 5-sulfosalicylic acide
      iii. 3 g Amido 10B
iv. 3 g sodium carbonate
v. 50 ml formic acid
vi. 50 ml glacial acetic acid
vii. 12.5 ml Kodak Photo Flo 600 solution

b. Dilute this mixture to one liter with distilled water. The mixture can be used immediately, but best results are achieved after allowing it to stand for several days prior to use. The shelf life is unlimited.

2. Procedure
   a. Take examination-quality photographs of the impression before (if impression is visible) and after enhancement.
   b. Stain and apply rinses to a small area of substrate that is not part of the impression to check for background staining. Should extensive background staining occur, do not use this enhancement method.
   c. Saturate the impression with the amido black reagent by immersing or soaking for approximately one minute. Development is typically quick, but allow for a minute or two to pass to ensure complete development.
   d. Rinse the impression with tap water to remove excess dye from the background by immersing or soaking for approximately one minute.
   e. The impression may be re-stained to make darker, if necessary.
   f. Allow the impression to air dry.

D. Powdering and Lifting  Although this may be the oldest and least sophisticated of development techniques, it is still the best method of use on many dry smooth non-porous surfaces. Latent prints are developed when fingerprint powder adheres to residues left by contact from the friction ridge skin.

1. Equipment
   a. Fingerprint powder (conventional and magnetic)
   b. Latent print brush
   c. Latent lifting tape or other lifting devices
   d. Latent lift cards
   e. Scissors
   f. Marking device
   g. Magnetic applicator

2. Procedure
   a. Apply a small amount of fingerprint powder to the brush by dipping the brush into the powder. Additional powder can be applied later if necessary.
   b. Lightly dust the area to be processed for latent prints.
      i. This procedure is relatively safe and the only safety concern is the inhalation of the fingerprint powder.
   c. When a print is fully developed stop the dusting.
   d. Anchor the lifting tape beside the print(s) then lay the tape over the prints and smooth the tape as much as possible to remove air pockets.
   e. Gently lift the tape from the surface.
   f. Place the tape on a latent lift card and smooth the tape with your finger.
   g. Cut the lifting tape and mark the lift card as to item number, area, position, initial, and date.

E. Magnetic powder, applied with magnetic applicator, good for textured surfaces, such as leather or wood, and glossy paper. As a general rule, a powder should be used which will contrast with the color of the surface. Many times additional lifts can be made from prints and quite often the later lifts are superior in quality to the first lift. Rubber lifts can be utilized for making lifts on curved surfaces. Faint bloody prints on non-porous surfaces like glass can often be enhanced by powdering or with amido black. These prints should be photographed prior to dusting and chemical processing. Do not attempt any processing of bloody prints until they are completely dry and have been photographed.
I. Trace evidence is a generic term for small materials which can be transferred when contact is made with an individual or an environment. Trace evidence can be found on any surface including people, floors, clothing, furniture, bedding, and on both the interior and exterior surfaces of vehicles. Small items such as fibers, hairs, broken glass, plastic fragments, paint fragments, and assorted microscopic debris may be left by a person or picked up from contact with the environment or another person. The method used to collect trace evidence depends on the location of the evidence, the nature and condition of the article to which the trace evidence is adhering, the presence or absence of other evidence and its nature and condition, the type of crime being investigated, the relationship of the evidence to the reconstruction of the crime scene, and any other circumstances that might arise.

A. Preliminary Considerations

1. Prior to the collection of any trace evidence, take overall and close-up photographs of the items.
2. The method of collection of the trace evidence is dependent on a number of different variables, including the type of surface, the area of the surface, the portability of the object, the type of trace evidence being sought, and the examiner’s discretion. In many instances, more than one method of collection can be used.

B. Methods of Collection

1. Hand picking/Particle Picking: This method involves the visual examination of an object for trace evidence such as hairs, fibers, glass, soil, and paint. It is the recommended technique when visible trace evidence is to be collected. This method allows the analyst to determine the exact location a specific piece of trace evidence was recovered from.
   a. Equipment: Particle picking may be performed without equipment, using only the analyst’s gloved fingers, or with the aid of a Post-it note, tweezers, forceps, or other tools. Serrated tools are not recommended as they are difficult to clean and keep contamination-free.
   b. Normal room light, oblique lighting, and/or an alternate light source can be used in the search. A magnifying glass may be used to enhance the search.
   c. When trace evidence is located, it is collected by hand or with a pair of forceps and placed into the appropriate sized packaging, such as a paper bindle.
   d. Use of tools, such as forceps and tweezers, may cause damage to the trace evidence. Clean any collection tools thoroughly between samples to prevent cross-contamination.
   e. Label collected trace evidence containers with the appropriate markings. Case record must state where the trace evidence was located.

2. Adhesive/Tape Lifts: This method uses clear one-sided adhesive tape, tape rollers, or fingerprint tape lifts to remove trace evidence from an object. Note, this is done for both visible trace evidence and as part of normal processing (even if no hairs, fibers, etc. are observed). The method is used to collect trace evidence from a variety of surfaces, such as vehicle seats and clothing items. This method of collection is not recommended for substrates that will strongly adhere to the tape lift adhesive (e.g. paper products, cardboard, etc.). This method is useful when collecting trace evidence that is not visible or apparent to the unaided eye.
   a. Equipment: Clear and colorless adhesive/tape lifters or sheets or Scotch tape, fingerprint lifting tape, mailing tape and clear and colorless plastic sheets.
   b. After the analyst defines the target area, expose the adhesive layer of the adhesive or tape lift. Do this just prior to use to avoid contamination.
   c. Repeatedly pat the adhesive or tape lift in the target area. The size of the area will be dependent upon how much the substrate sheds fibers/particles, how much dirt/debris/trace evidence is present on the substrate, the overall size of the lift used and the need to precisely define the location of the trace evidence.
d. This determination is at the discretion of the analyst based upon the evidence as evaluated on a case to case basis.

e. Place the lift onto a clear plastic sheet to protect the collected trace evidence from contamination, damage, or loss.

f. Repeat the process until the defined area is finished.

g. Package in an envelope or other container to prevent contamination, damage, or loss.

h. Label collected trace evidence containers with the appropriate markings. The case record must state where the trace evidence was located.

3. **Combing**: This method uses a comb or brush to collect trace evidence from the body of a victim or suspect.
   
a. A piece of butcher paper should be placed under the area to be brushed to collect any evidence that may fall.
   
b. The brush or comb should only be used on one particular area of the body at a time, such as the pubic region. If additional areas are to be brushed or combed, use a new brush or comb.
   
c. Package each combing (comb and paper) individually and the package marked with the appropriate information

4. **Vacuuming** trace samples may be collected using a vacuum with an in-line filter.
   
a. The filter containing the debris is removed and packaged in large petri dishes, paper packages, Kapak bags, or other suitable containers.

5. **Removal of an object**: If the trace evidence is securely attached to an object and cannot be easily removed (e.g., a paint smear on an article of clothing), then collect the entire object or the portion containing the trace evidence.

C. **Packaging of Trace Evidence at Crime Scenes**
   
1. The type of packaging used to store the collected trace evidence will depend on what type of evidence is collected and will minimize the chance of cross contamination and loss. In most instances a paper bindle or glassine bindle will be used. Depending on the amount of sample/control collected, the trace evidence should be placed in the smallest container that it will comfortably fit into such as a pillbox, coin envelope, or paper bindle

2. At no time should the item (trace evidence) be packaged with cotton or other protective material directly touching the object. If the trace evidence is subject to breakage, as is the case with glass or even large paint samples, then it can be packaged in a bindle and placed into a box to prevent further breakage.

3. The original covering supplied with the tape lift should be used to protect the sticky surface after it has been used. Alternatively, the tape lift can be placed against the the inside of a plastic bag. The tape lift can then be placed into a manila envelope and marked with the appropriate information.

4. If the bindle is small, it should be placed into an envelope and the outside of the envelope should be marked as described above.

5. Trace evidence, which consists of fine particles such as a dry soil sample, should be first collected in a plastic or glass container with a lid to prevent loss of the sample. If this is not available, then use a paper bindle placed in a manila envelope making sure the corners are sealed to ensure the material stays in its packaging. If the sample is wet, it will need to be dried at the laboratory before booking or storage. Again, the proper information should be on both the inner and outer packaging.

6. Once all the trace evidence has been individually packaged, they can all be consolidated and placed into a larger envelope or brown paper bag. The individual bindles and envelopes must be folded in such a manner to prevent leakage, and should be taped closed to prevent leakage. Tape lifts stuck to plastic bags and put inside a larger envelope do not need to be individually tape sealed.

D. **Marking of Trace Evidence/Controls Collected at Crime Scenes**
   
1. Each package should be individually marked with the laboratory number, item number, a brief description of the item, the location from which the sample was collected, date of collection, initials of the collector.

2. When the trace evidence is consolidated into a larger envelope, the exterior of the packaging material should be labeled with the laboratory number, date, contents of bag/envelope (items included) and collectors initials

E. **Preservation of Trace Evidence Collected at Crime Scenes**
   
1. Trace evidence of a biological nature, such as hair evidence, should be frozen so that any root sheaths or other residue such as blood, if present, can be analyzed for DNA. However, even if there is no root material or foreign matter on the hair, the hair may still be suitable for mitochondrial DNA analysis and still should remain frozen.
2. Most other trace evidence can be stored at room temperature in a controlled environment unless there is the possibility that biological evidence is physically present on the trace evidence collected. If this is the case, then this trace evidence should be preserved in the freezer.

3. If the trace evidence is transferred to the law enforcement agency at the scene, the CSI or other collector from the Laboratory should indicate on the exterior packaging whether or not the contents should be stored frozen or at room temperature. This information should also be conveyed verbally to the evidence handlers at the scene.

F. Collection of Controls at Crime Scenes

1. When collecting various controls, they should be representative of the sample material being collected. For example, if a multi-color carpet is present, the control collected should contain all the various colored fibers present in the carpet. More than one fiber of each color should be collected. A representative swatch of the material can also be collected. Example: removing tufts of carpet or a cut out a section of the carpet (preferred)

2. If the material from which the control is being collected is damaged in some areas either through wear, chemical or environmental causes like sun damage, control from the damaged area as well as the undamaged area should be collected.

3. When collecting controls from the interior of the vehicle, collect upholstery fibers as well as carpet and, if present, floor mat and seat covers. If the upholstery is damaged and the underlying seat foam is visible, collect a control from the foam material as well.

4. In most cases, the greater the number of control materials collected, the better the chance of associating the perpetrator to the crime scene or to the victim. However, the control material must be representative of the evidence samples. Do not collect just a single fiber, paint chip or hair as a control material.

II. The following are the procedures for the collection of fibers.

A. Introduction: Fiber comparisons are performed on both natural and synthetic fibers. A potential fiber source may have one or more different kinds and colors of fibers that are present, and the differences may only be apparent using microscopic or instrumental techniques; therefore, it is important to obtain fiber standards that adequately represents all of the fiber types present in the potential source. Differences in the color or texture of a fabric, carpet, or other source should alert the analyst that different fiber types might be present so a standard must be collected from each discernible area.

1. Movable Objects If the potential source of a fiber transfer can be packaged and transported to the laboratory with ease, then it should be submitted in its entirety (e.g., clothing items, throw rugs, etc.) Package movable items in clean, unused packages such as envelopes or paper bags. Securely seal and label the package with a description of where the standard came from and other appropriate markings.

2. Immovable Objects If the potential fiber source is from a large object or one not easily transported, such as car upholstery or carpeting from a dwelling or vehicle, cut representative samples from various areas of the object. Be sure the cut is deep enough that the backing material or substrate is also collected. If the object appears uniform, only one sample needs to be collected. Except with vehicles collections must be performed at all carpeted areas. collect samples that are visually different (e.g., faded/worn areas, and different colored areas). A sample size of approximately 1” x 1” is fine unless variations are visible, thus warranting a larger sample size. If the source appears uniform, a smaller size cutting may be acceptable. Package in an envelope, paper bag, or other container. Securely seal and label the package with a description of where the samples came from and other appropriate markings.

B. Considerations

1. Do not pull or tape lift fiber standards. Securely seal all possible openings in packaging, including seams and air holes. Do not allow potential fiber sources to come into contact with fiber evidence samples as cross-contamination could occur.

2. A description of the fiber standard must be recorded in the case record. The description will include what the standard is and from where it was collected (to include sketches, measurements, and photographs).

III. The following are the procedures for the collection of glass.

A. Introduction: As with many other areas of criminalistics, the examination process is often more concerned with establishing an association between an individual, item, or crime scene than the actual identification of the substance itself. Broken glass, which can commonly be found at crime scenes or on persons who have been involved in crimes is one of those substances. Although during the examination process the unknown material will be identified as glass, the fact that glass is present usually provides no association with a particular crime or victim unless it can be linked to broken glass found at the scene. Therefore the proper collection of control glass samples from the crime scene is the first step in the glass examination and comparison process. Glass comparisons are performed on window glass, vehicle glass, bottle glass, and other glass types. A critical factor in comparing glass evidence to a potential glass source is whether the characteristics of the evidence sample fall within the range of variation present in the source; therefore, it is important to obtain a sufficient number of glass samples to adequately represent the range of all characteristics present.
The analyst should consider the probative value of a physical match of glass to the source and the determination of the direction of force. Collect as much of the original glass as possible if a physical match may have probative value. A physical match comparison is usually not attempted in the field due to the lack of a controlled environment. The following outline provides the basic steps involved in the proper collection of control samples from known sources of glass, which will be used as a source of comparison.

B. Preliminary Considerations

1. When collecting control glass samples, especially from large pieces of remaining broken glass, the possibility of a fracture or “jig-saw” puzzle match (physical match) should be considered. Caution must be taken in preserving additional types of trace evidence that might be present on the control glass sample including blood, fibers, hairs, shoeprint impressions, fingerprints, and paint transfers. When taking a sample from a known source of glass, the glass should be sampled from various locations throughout the sample in order to best represent the source material. The known sample should consist of the largest amount of material that can be reasonably collected. If the sample is still present in a structure, for example a window frame or light assembly, then the inside and outside of the remaining glass pieces should be marked. This information can be useful in determining the direction of force and to facilitate a possible physical match.

2. Large glass pieces should be packaged with care to prevent further breakage that might result from the transportation of the item. Each of the packages containing the control glass sample should be marked with at least the case or laboratory number, date, location obtained, and the initials of the person collecting the sample.

3. At all times, care should be taken to avoid contamination of known and control glass samples, as well as the mixing of control samples which have been collected from various locations.
   a. Package each standard collected separately in a cardboard box or other rigid container and secure to reduce the likelihood of further breakage or damage to the fractured edges. Small glass particles may be packaged in folded Post-it notes, paper folds, envelopes, paper bags, etc. and then placed in a padded envelope if necessary to prevent damage or injury. Securely seal and label the package with a description of where the standard came from, along with appropriate labeling or marking.

4. Broken glass edges are extremely sharp. Handle with caution. Use personal protective gear or tools to reduce the risk of being cut.

5. The following are a set of general guidelines for the collection of commonly occurring control material of glass samples and does not attempt to cover all sources of glass that may be found at a crime scene or might be used for comparison purposes.

C. Sample Collection and Handling

1. Vehicle Door Window Glass
   a. Vehicle door glass usually consists of tempered glass, which when broken, will be found in small cube “dice” shaped pieces. The broken pieces of tempered glass will not have sharp or pointed edges. In most circumstances the window will be completely broken with little if any glass left in the frame. If only a single vehicle window is broken then a sample of glass from that window should be collected. The control may be collected from various areas of the vehicle including the floor, inside the door frame and/or from pieces that remain in the frame. The control should consist of as many pieces as reasonably possible.
   b. The control glass samples from the window should be collected with forceps; however, depending on the size of the control glass pieces, they can be collected by gloved hands. Care must be taken not to cut oneself.

2. Vehicle Windshield Glass
   a. Modern front windshield glass is laminated, consisting of a piece of plastic laminate sandwiched between two pieces of glass. This type of glass resists penetration and is very hard to break into pieces. Since the possibility exists that the two flat glass pieces used in the glass may be from different pellets (sources) or may actually be different in color, control samples of the glass if broken on both sides should be taken. Since vehicle window glass usually remains intact in the windshield when damaged, care should be taken in documenting any damage to the window that might indicate the direction of an impact prior to the collection of any control glass material.
   b. Control materials can be collected with forceps from areas around any damage to the windshield. Since most of the glass will likely be slivers and/or very small pieces, it is unlikely that a physical match can be made; however, prior to collecting the sample consider the possibility of a physical match.

3. Window and Door Glass
   a. Window type glass, sometimes referred to as flat or glass, may consist of a double pane (two pieces of glass with air or a gas trapped between the pieces). If this is the case, and both panes are broken, then samples from each of the panes should be collected. If the broken window or door were a point where entry was made these can provide large surface areas for prime evidence like latent fingerprints. If these
IV. The following are the procedures for the collection of paint.

A. **Introduction:** Paint, as a type of trace evidence, can be present in a variety of cases including hit and runs, assaults, burglaries and homicides. Paint can be found as a chip, consisting of single or multiple layers, a smear, or may be painted on an object in an act of vandalism. Like other forms of trace evidence, paint evidence can be used to link a suspect or victim to a scene, or to link an object to the scene or an individual. One of the most important aspects of any comparison of paint involves the proper collection of the paint sample from an unknown source as well as the control sample to which it is to be compared. The information derived from the control sample through its analysis will be the basis of its comparison to an unknown sample. Paint comparisons are performed on a variety of paint types and are used to determine if two samples are similar or different and if they originated from the same source.

b. **Glass:** Glass can be collected for the purpose of determining direction of impact of a bullet or other fracture analysis. If this is requested, record which side of the glass was on the outside of the window, and which side was on the inside before collecting the remaining pieces of glass from the window or door. Prior to collecting the glass in this situation, the damage should be documented as well as any supporting evidence that might support the direction of the breakage. If size limitations preclude collecting all the glass, always attempt to obtain a sample from an area near the point of impact and then collect and mark separate specimens from distant corners of the pane as well.

c. **Collect standards that are still adhering to the frame and as close as possible to the point of impact.** Do not collect glass standards from the ground unless it is unavoidable as this increases the likelihood of introducing foreign glass to the standard. Collect several samples of glass from different parts of the same pane of glass. This is because of the potential variation that exists in the pane of glass. One suggestion is to collect standards from the 12, 3, 6, and 9 o’clock positions around the edge of the break. Collect several samples from dual-pane windows such as thermal windows or vehicle windshields that consist of two panes of glass laminated together. Label clearly which standard is from the inside pane and which is from the outside pane. A sample size of approximately 2.5 centimeter square is usually adequate.

d. **Collection of the glass samples can be done using forceps or by hand.** Gloves and the proper hand protection should be worn while collecting the glass pieces by hand to avoid injury.

4. **Bottle and Ornamental Glass (vases, candle holders, etc.)**

a. **In many instances, large pieces of broken bottle glass or ornamental glass may remain at the scene and there exists the possibility of a physical match between these pieces and those deposited on a suspect.** Therefore, an attempt should be made to collect all pieces of the broken bottle or ornamental glass, which appear to be from a single source. If there appears to be more than one source of glass, either due to location of the item, color, shape or other distinguishing features then collect each type separately. The pieces should be packaged to prevent further breakage, using such items as butcher paper or paper bags for cushion if placing the items in a box and to minimize the loss of additional evidence such as fingerprints and trace evidence.

b. **If the item is primarily intact, prior to its collection consideration should be given to fingerprinting the glass object at the scene to minimize loss of potential fingerprint evidence.**

5. **Headlamps and Automotive Mirrors**

a. **When a headlamp or automotive mirror is broken, attempt to collect the entire assembly leaving the glass in place so as to facilitate a possible physical match.** Pieces of these items may be left at a scene of a hit and run, or found on the victim’s clothing. All glass found at a hit and run scene should be collected due to the fact that more than one type of glass may be present and there may be a possibility of a “physical match” with glass remaining on a vehicle, such as with a broken headlamp.

b. **Like other glass evidence, it should be packaged in a manner that will not contaminate the specimen and will prevent its loss.**

c. **If only pieces remain in the headlamp or mirror assembly, then collect as many pieces as possible or remove the assembly and package appropriately.**

6. **Other Sources of Glass**

a. **Mineral wool (glass wool, slag wool and rock wool) is often found as insulating material in ceiling tiles and home insulation.** Glass fibers are also a primary component of fiberglass boats and automotive parts. Evidence samples and their representative control materials should be collected.

b. **As with other sources of glass, controls should be collected that are representative materials of the item of evidence collected.** It is best to collect the sample of the damaged area as well as control of areas near the damage to get a representative material. Unless it is the only option, it is best not to collect the control from like or undamaged ceiling tiles or insulation due to the fact that variations may occur due to lot number or the use of different manufacturer’s products.

IV. The following are the procedures for the collection of paint.

A. **Introduction:** Paint, as a type of trace evidence, can be present in a variety of cases including hit and runs, assaults, burglaries and homicides. Paint can be found as a chip, consisting of single or multiple layers, a smear, or may be painted on an object in an act of vandalism. Like other forms of trace evidence, paint evidence can be used to link a suspect or victim to a scene, or to link an object to the scene or an individual. One of the most important aspects of any comparison of paint involves the proper collection of the paint sample from an unknown source as well as the control sample to which it is to be compared. The information derived from the control sample through its analysis will be the basis of its comparison to an unknown sample. Paint comparisons are performed on a variety of paint types and are used to determine if two samples are similar or different and if they originated from the same source.

b. **Glass:** Glass can be collected for the purpose of determining direction of impact of a bullet or other fracture analysis. If this is requested, record which side of the glass was on the outside of the window, and which side was on the inside before collecting the remaining pieces of glass from the window or door. Prior to collecting the glass in this situation, the damage should be documented as well as any supporting evidence that might support the direction of the breakage. If size limitations preclude collecting all the glass, always attempt to obtain a sample from an area near the point of impact and then collect and mark separate specimens from distant corners of the pane as well.

c. **Collect standards that are still adhering to the frame and as close as possible to the point of impact.** Do not collect glass standards from the ground unless it is unavoidable as this increases the likelihood of introducing foreign glass to the standard. Collect several samples of glass from different parts of the same pane of glass. This is because of the potential variation that exists in the pane of glass. One suggestion is to collect standards from the 12, 3, 6, and 9 o’clock positions around the edge of the break. Collect several samples from dual-pane windows such as thermal windows or vehicle windshields that consist of two panes of glass laminated together. Label clearly which standard is from the inside pane and which is from the outside pane. A sample size of approximately 2.5 centimeter square is usually adequate.

d. **Collection of the glass samples can be done using forceps or by hand.** Gloves and the proper hand protection should be worn while collecting the glass pieces by hand to avoid injury.

4. **Bottle and Ornamental Glass (vases, candle holders, etc.)**

a. **In many instances, large pieces of broken bottle glass or ornamental glass may remain at the scene and there exists the possibility of a physical match between these pieces and those deposited on a suspect.** Therefore, an attempt should be made to collect all pieces of the broken bottle or ornamental glass, which appear to be from a single source. If there appears to be more than one source of glass, either due to location of the item, color, shape or other distinguishing features then collect each type separately. The pieces should be packaged to prevent further breakage, using such items as butcher paper or paper bags for cushion if placing the items in a box and to minimize the loss of additional evidence such as fingerprints and trace evidence.

b. **If the item is primarily intact, prior to its collection consideration should be given to fingerprinting the glass object at the scene to minimize loss of potential fingerprint evidence.**

5. **Headlamps and Automotive Mirrors**

a. **When a headlamp or automotive mirror is broken, attempt to collect the entire assembly leaving the glass in place so as to facilitate a possible physical match.** Pieces of these items may be left at a scene of a hit and run, or found on the victim’s clothing. All glass found at a hit and run scene should be collected due to the fact that more than one type of glass may be present and there may be a possibility of a “physical match” with glass remaining on a vehicle, such as with a broken headlamp.

b. **Like other glass evidence, it should be packaged in a manner that will not contaminate the specimen and will prevent its loss.**

c. **If only pieces remain in the headlamp or mirror assembly, then collect as many pieces as possible or remove the assembly and package appropriately.**

6. **Other Sources of Glass**

a. **Mineral wool (glass wool, slag wool and rock wool) is often found as insulating material in ceiling tiles and home insulation.** Glass fibers are also a primary component of fiberglass boats and automotive parts. Evidence samples and their representative control materials should be collected.

b. **As with other sources of glass, controls should be collected that are representative materials of the item of evidence collected.** It is best to collect the sample of the damaged area as well as control of areas near the damage to get a representative material. Unless it is the only option, it is best not to collect the control from like or undamaged ceiling tiles or insulation due to the fact that variations may occur due to lot number or the use of different manufacturer’s products.
including vehicle paints, architectural paints, spray paints, cosmetic lacquers, etc. A potential paint source may have one or more different kinds and colors of paint that are present in vehicle paints. The differences may only be apparent using microscopic or instrumental analysis; therefore, it is important to obtain paint standards that adequately represent all of the paint types present on a potential source. The analyst should consider the possibility of a physical match of paint chips to the source when determining how to collect paint standards.

1. **Movable Objects**  If the potential source of a paint transfer can be packaged and transported to the laboratory with ease, then it should be submitted in its entirety (e.g., bumper of vehicle, bicycle, etc.) Package movable items in clean, unused, packages such as envelopes or paper bags. Securely seal and label the package with a description of where the standard came from, along with any other labeling requirements.

2. **Immovable Objects**  If the potential paint source is from a large object or one not easily transported, such as a vehicle, use the following procedure to collect a paint standard. Collect paint from an area as close to the area of damage, but not within the point of damage. If a physical match examination is deemed appropriate, collected all the damaged body panels rather than attempting to remove paint standards. Use a clean steel dissecting scalpel, or knife to gently pry, carve, or chip the paint from the surface down to the metal. If possible, do not remove the paint by scraping as all paint layers may not be represented or the layer structure may be destroyed. Collect approximately 0.5” x 0.5” combined amount of paint from a particular damaged area, when possible. Place the paint standard into a paper fold or small paper envelope, carefully sealing to prevent loss. Continue to collect paint from each damaged area in the same manner, even if the object appears uniformly painted. Also collect samples that are visually different. Package and label each area separately. Securely seal and label the package with a description of where the sample came from, along with any other labeling requirements.

B. **Collection and Packaging of Control Paint Samples from Vehicles**

1. Collect control paint samples from around all freshly-damaged areas of a vehicle. This will provide a range of samples due to the fact that the paint may differ in type or composition on different areas of a vehicle, even if the color is the same. If more than one vehicle is involved, then collect control samples from each vehicle as well as any cross transfers that may have occurred. If large flakes are present along broken edges or chips of paint are missing, then a physical match may be possible. Carefully collect these areas and protect the edges from further damage.

2. Paint should be collected as close to the damaged area as possible. Remove a sample of paint either by bending the metal back slightly so that the paint will flake off or scrape or chip the paint off using a clean scalpel or knife blade. The blade must be clean prior to collecting each sample of paint, even if it is from the same vehicle. In many cases, the paint sample will consist of a clear coat, colored top coat, and primer layer. Make sure that all layers of the paint down to the metal or plastic are collected as a control sample.

3. Place each sample collected in a separate paper or glassine bindle and label. The label should include the laboratory number, the date the sample was collected, who collected the sample, and the location on the vehicle. The make, model and year of vehicle should be recorded in the notes.

4. Do not collect a control paint material using a tape lift or other sticky object. The adhesive may interfere with future analysis of the material.

5. Do not place control material directly into an envelope unless large pieces are present. Placing small chips of paint directly into an envelope may result in a loss of material.

C. **Collection and Packaging of Paint Samples from Burglary Scenes**

1. Collect a sample of paint from all areas in which a tool may have contacted the scene. Make sure to collect all layers of paint present. Do not destroy an actual toolmark, if present, when collecting a control paint material. Carefully remove a paint sample from around the mark. Use a clean blade for every sample collected, including those collected from the same item but in different areas. Be aware that the tool itself may be painted and a cross-transfer of paint from the tool may be left at the scene. Collect any cross-transfers by removing the area or by carefully scraping the paint from the surface. Be sure to include the original surface area as well as a control from that surface area.

2. The tool itself may contain trace evidence other than paint, such as plastic or insulation; therefore, care must be taken in transporting the tool. Wrap the area containing the trace in clean paper and seal with tape to prevent loss. Collect other possible sources of trace evidence as controls as well as the paint samples. If the tool is located at the scene and a comparison of any trace evidence on the tool is desired, no attempt should be made to actually match the toolmark at the scene to the tool. This action could cause paint or other trace evidence transfers to occur which would lessen their significance if found at a later date. In addition, this may introduce additional and erroneous toolmarks onto the evidence item.

D. **Other Considerations**

1. When collecting foreign paint from non-painted surfaces such as a rubber bumper or wood frame, attempt to collect the paint and the substrate material together. Make sure to collect control material from the underlying material as background material. Collect each sample separately and label accordingly.
2. In some cases, especially when the amount of paint transfer on an object is small, it is best to collect the entire object containing the paint transfer. If this is not feasible, collect all the paint transfer as well as a sample of the underlying material attached to the paint transfer and a control paint material from the underlying material. Label all items with the location obtained and whether or not it is a control or the unknown sample of interest (transfer paint sample).

3. Paint may be transferred to the clothing of a hit and run victim and should not be removed at the scene, unless the paint is large enough and it will be lost in transport. The area thought to contain a paint transfer can be marked at the scene. Clothing items should be carefully removed from the victim and wrapped individually in paper before placing in a labeled brown paper bag.

4. Substantial variations in thickness and layer sequences over short distances can exist across a painted surface. This is particularly true in architectural paint and for vehicle paint where curves, corners, and edges are often impact points and may have been subjected to previous damages, sanding, or over-painting. Known paint samples should be collected from these areas, when recognized. When contact between two painted surfaces is indicated, the possibility of cross-transfers must be considered. Collect both objects or paint standards from both surfaces. Do not allow potential paint sources to come into contact with paint evidence samples. Cross contamination may occur. Securely seal all possible openings in packaging, including seams, corners and air holes.

5. A description of the paint standards must be recorded in the case record. The description will include what the standard is and from where it was collected (documented by notes, sketches, measurements, and photographs).

V. The following are the procedures for the collection of soil samples.

A. Introduction: The collection of proper reference samples (those from a known location) is essential to the evaluation and comparison to soil samples collected from various items of evidence. Since soil can vary in its vegetative, animal, and mineral composition as well as its man-made components (e.g. building materials and asphalts) across a relatively small geographical area, the collection process must ensure that a sufficient number of reference samples from various nearby areas are collected.

B. General Collection

1. Collect reference samples from various areas near and around the crime scene. A simple change in color can be significant. These reference samples should be representative of the soil variation within the crime scene area. If the area is an open area, collect reference samples from the initial crime scene then collect additional reference samples from distances of approximately 10 ft., 50 ft. and 100 ft. in all four compass directions where soil is present.

2. Collect a reference surface soil sample, especially in those cases thought to be involved with casual contact. Do not dig down to obtain the reference soil sample. If the area in question involved excavation, then collect numerous samples from different depths and note the depth.

3. All soil samples should be dry before packaging. If the soil is wet or damp when collected, it might develop mold, which can cause the organic matter in the soil to decompose. Collect 1 to 8 ounce reference samples from the various areas in leak proof containers. In most cases, this should be adequate for further examination.

4. Mark each container with the appropriate identifiers including case number, date, item number, initials of individual who collected the reference sample and the location obtained. A note can be made regarding whether or not the sample had to be dried before packaging.

C. Special Issues

1. To best enable the best selection of reference soil samples and controls from the appropriate geographical areas, basic facts of the case must be obtained from the investigators at the scene before collection begins. This will help focus the collection of reference soil samples from specific locations. Collect a reference soil sample from the suspected source area. If the crime scene contains shoeprint or tire track impressions, then the reference soil samples need to be collected from the area within the impression. However, this must be done after the impressions have been documented.

a. If a cast is made of the entire shoe or tire impression, then the soil remaining on the cast can be used as a control. In addition to this soil sample, supplemental reference samples close to the impression should be collected as well.

b. If the sample of dirt is firmly attached to an object, like a clump of mud on a shoe, do not remove it at this time, but package the entire item in an appropriate container.

c. Reference soil samples must be collected as soon as possible after the crime scene is discovered. If the reference samples are not collected in a timely manner, the soil may be altered by cultivation, contamination, or natural events.

END OF DOCUMENT
I. Bloodstain Pattern Analysis is the study of blood as it comes into contact with a surface. Crime scenes often contain multiple bloodstains that can be examined and interpreted in order to help establish the nature of the crime and help assist in determining the series of events that may have occurred to produce those stains. The mere presence or absence of blood in and of itself may be of value, independent of any pattern that may be present.

A. Introduction: Many bloodstains only require proper documentation at the crime scene and no further reconstruction. This procedure will guide the analyst in both the proper documentation and interpretation of bloodstain patterns. If all the information is not available at the time of the scene the responder should attempt to find out as much information regarding the scene from the investigator and the pathologist and relay it to the analyst as soon as possible. The factors that influence bloodstain pattern analysis include:

1. Information about the type of weapon.
2. The location of any wounds on the involved individuals.
3. The clothing worn by the bleeding person or people.
4. The history of the location (clean house vs. bar with daily fights).
5. The environmental conditions since the incident.
6. The actions of first responders and emergency personnel.

B. Documentation: The proper documentation is vital for interpretation of bloodstain patterns which can provide meaningful information and aid in crime scene reconstruction. This must be accomplished through a combination of notes, diagrams, photographs, and the collection of the actual bloodstains. Besides photography, a rough diagram is useful to show the general appearance of the stains, the orientation, location, direction, size, and their relative position to other areas of the crime scene. The diagram is also useful for documenting small bloodstains that are difficult to photograph.

C. Bloodstain Pattern Photography: In general, bloodstain pattern photography is no different than any other type of crime scene photography. However, due to the nature of the stains and the information that can be derived from them, it is imperative that the bloodstain/spatter photographs depict enough information to lend themselves to further analysis in order to reconstruct or answer additional questions that may arise during the investigation. The photographic documentation of bloodstain patterns should include overall, medium-range, and close-up views. A scale should be included in close-up photographs. The close-up photographs should be taken such that the captured image is parallel to the surface of the pattern. For large bloodstain patterns it may be necessary to grid the area and photograph each grid with either a number or letter distinction.

1. Overall Scene Photographs: Take the initial overall photographs as with any other scene. These will document the scene before any actual processing of the scene has taken place.

2. Bloodstain Pattern Photographs (Road Mapping Technique): Take sufficient photographs to orient the location of the bloodstains within the scene. Next place placards next to the various bloodstain patterns of interest, especially when dealing with more than one pattern in a single location. First recognize the different bloodstain pattern types that are present in the scene. Label each pattern with a sequential number or letter, each representing a different bloodstain pattern. Determine which individual stains or groups of stains within a given pattern are of interest. Label each of the stains within the pattern with a sub-label.

   a. Use a bold marker to mark on the label.
   b. Make sure that these markers or at least the bold marking depicting the sub-labels are readable from several feet away.
   c. Place the sub-label adjacent to the pattern or stain in question.
   d. The adhesive paper scales can be positioned in an “L” shape near the stain or around the entire stain, if necessary.
e. Take another orientation photograph with all the labels in place showing the relationship between those different placards and the bloodstains they represent. These will represent landmarks in the overall photographs.

f. Take additional photographs of each pattern type. These photographs should be taken close enough to see the sub-labels and the patterns.

g. Next, close-up photographs of the individual sub-labeled stains within the specific pattern should be taken. These stains should always have adhesive or other scales in them clearly showing the pattern sub-label.

3. **Bloodstain pattern Analysis (Grid Method):** This method uses a grid in order to help organize the sequence of photographs taken. Grid off the area in squares with tape or string (2’x2’ is a recommended size).

a. Take overall photographs of the bloodstain patterns before any analysis.

b. Take an overall picture of the grid before marking each square within the grid with a number or letter.

c. Take an overall photograph of the grid with the numbering/lettering system in place.

d. Take close-up photographs of the stains of interest within each individual grid square, marking each stain of interest with an identifier and ruler (an adhesive tape ruler can be used). The grid square should fill-up the entire frame of the photograph.

e. Make sure that at least one of the photographs shows which grid square you are photographing and its relationship to the individual or groups of stains of interest within the grid.

f. A laser grid may also be used.

4. **Hybrid Method:** The bloodstain patterns may not be extensive enough to require either the Road Mapping Technique or the Grid Method. Good overall, medium range, and close-up photographs can sufficiently document bloodstain patterns as long as the locations of the patterns are documented.

D. **Observations and Interpretations**

1. **Determination of Direction of Travel**

a. Where possible, the direction of travel will be determined based on the stain’s shape.

b. The tail of the parent drop will point in its direction of travel.

c. The tail of the wave cast-off points back to the parent drop.

d. Blood in motion falling on a horizontal surface may show scalloped edges (produced at an angle of less than 90 degrees) on the side indicating the direction of travel of the source.

2. **Determination of Impact Angle**

a. Obtain the width and length of the stain in millimeters (mm). The impact angle can be determined by using the following formula: impact angle = arcsin (width of stain)/(length of stain)

b. The width and length of the stain should be measured by calipers or a measuring device with fine divisions less than 1 mm.

3. **Point or Area of Convergence**

a. The area of convergence is determined by tracing the long axis of well-defined bloodstains (preferably drops traveling in an upward direction) within the pattern back to a common area or source. The area of convergence is a two-dimensional representation.

b. Using strings or graphic tape, extend the strings through the long axis of the individual bloodstains.

c. Determine the point or area where the strings from each of the bloodstains converge.

d. Take measurements to locate the area of convergence in three dimensional space relative to a known location.

4. **Point or Area of Origin**

a. An area of origin is used in tracing the origin of a bloodstain or series of bloodstains back to location that produced the bloodstain.

b. Project the impact angles of well-defined bloodstains back to an axis constructed through the area of convergence.
c. Using strings projected from each measured bloodstain at its angle of impact, trace them back to an axis perpendicular to the plane on which the bloodstains are located. These should pass through their area of convergence.
d. The determined area of origin could represent the height above a floor or the distance from a wall, ceiling or other object, to the source of the blood or impact site.

e. Conclusions regarding area of origin:
   i. Include a range of possible impact sites.
   ii. Consider a range of possible flight paths that might produce a similar angle of impact.

5. **Actions Producing Stains**

a. Depending on the size, shape, and distribution of blood spatter and bloodstains found at the crime scene, the analyst may be able to characterize the bloodstains as low energy, medium energy, or high energy or some combination.

b. An alternative approach is to focus on describing or classifying stains in terms of their physical characteristics. This taxonomic method appears to be the best way moving forward to describe stains as these classifications describe the basic nature of the underlying event, such as cast-off, transfers/contact pattern stains, swipes, wipes, drips, trails, expired blood, arterial spurring and impression type patterns. The scene context may give information that, when coupled with the classification, leads to a conclusion about the source event.

6. **Absence of Blood**

a. The lack of blood or voids present at the scene should also be noted.

b. The lack of blood may indicate that this is not the original scene and the victim was not injured here.

c. The absence of blood due to a void area in a pattern may indicate the presence of an object during the event or an intervening object that has since been removed.

d. The presence of clothing may also prevent or restrict blood from being deposited within the scene.

7. **Direction of Flow**

a. Blood flows in the direction of gravity. If the flow is in a different direction or changes direction this denotes movement or another force acting upon the stain.

---

**E. Collection**

1. After thorough documentation of bloodstains, representative samples of the bloodstains should be collected along with appropriate control swabs.

2. Refer to Scene.04 for the procedure on collecting swabs of biological evidence. Ensure all unassociated bloodstains are collected and packaged separately. If there are multiple small associated bloodstains, the bloodstains may be swabbed and concentrated on the tip of individual swabs.

**F. Experimentation**

1. In some cases, it may be necessary to reproduce the mechanism by which a bloodstain pattern was created before the analyst makes an interpretation. In these cases, the important elements of the scene and suspected actions that occurred should be replicated as close as possible in controlled laboratory settings. This experimentation and research will ensure that a particular pattern has been created within the action of a particular even or mechanism.

2. Consult with the Crime Scene Supervisor before beginning any experimentation.

**G. SWGSTAIN 2009 Recommended Terminology**

1. **Altered Stain** - A bloodstain with characteristics that indicate a physical change has occurred.

2. **Angle of Impact** - The acute angle (alpha), relative to the plane of a target, at which a blood drop strikes the target.

3. **Area of Convergence** - The area containing the intersections generated by lines drawn through the long axes of individual stains that indicates in two dimensions the location of the blood source.

4. **Area of Origin** - The three-dimensional location from which spatter originated.

5. **Backspatter Pattern** - A bloodstain pattern resulting from blood drops that traveled in the opposite direction of the external force applied; associated with an entrance wound created by a projectile.
6. **Blood Clot** - A gelatinous mass formed by a complex mechanism involving red blood cells, fibrinogen, platelets, and other clotting factors.

7. **Bloodstain** - A deposit of blood on a surface.

8. **Bloodstain Pattern** - A grouping or distribution of bloodstains that indicates through regular or repetitive form, order, or arrangement the manner in which the pattern was deposited.

9. **Bubble Ring** - An outline within a bloodstain resulting from air in the blood.

10. **Cast-off Pattern** - A bloodstain pattern resulting from blood drops released from an object due to its motion.

11. **Cessation Cast-off Pattern** - A bloodstain pattern resulting from blood drops released from an object due to its rapid deceleration.

12. **Directionality** - The characteristic of a bloodstain that indicates the direction blood was moving at the time of deposition.

13. **Directional Angle** - The angle (gamma) between the long axis of a spatter stain and a defined reference line on the target.

14. **Drip Pattern** - A bloodstain pattern resulting from a liquid that dripped into another liquid, at least one of which was blood.

15. **Drip Stain** - A bloodstain resulting from a falling drop that formed due to gravity.

16. **Drip Trail** - A bloodstain pattern resulting from the movement of a source of drip stains between two points.

17. **Edge Characteristic** - A physical feature of the periphery of a bloodstain.

18. **Expiration Pattern** - A bloodstain pattern resulting from blood forced by airflow out of the nose, mouth, or a wound.

19. **Flow Pattern** - A bloodstain pattern resulting from the movement of a volume of blood on a surface due to gravity or movement of the target.

20. **Forward Spatter Pattern** - A bloodstain pattern resulting from blood drops that traveled in the same direction as the impact force.

22. **Mist Pattern** - A bloodstain pattern resulting from a spray of micro-drops as a result of the force applied.

23. **Parent Stain** - A bloodstain from which a satellite stain originated.

24. **Perimeter Stain** - An altered stain that consists of the peripheral characteristics of the original stain.

25. **Pool** - A bloodstain resulting from an accumulation of liquid blood on a surface.

26. **Projected Pattern** - A bloodstain pattern resulting from the ejection of a volume of blood under pressure.

27. **Satellite Stain** - A smaller bloodstain that originated during the formation of the parent stain as a result of blood impacting a surface.

28. **Saturation Stain** - A bloodstain resulting from the accumulation of liquid blood in an absorbent material.

29. **Spatter Stain** - A bloodstain resulting from a blood drop dispersed through the air due to an external force applied to a source of liquid blood.

30. **Splash Pattern** - A bloodstain pattern resulting from a volume of liquid blood that falls/spills onto a surface.

31. **Swipe Pattern** - A bloodstain pattern resulting from the transfer of blood from a blood-bearing surface onto another surface, with characteristics that indicate relative motion between the two surfaces.

32. **Target** - A surface onto which blood has been deposited.

33. **Transfer Stain** - A bloodstain resulting from contact between a blood-bearing surface and another surface.

34. **Void** - An absence of blood in an otherwise continuous bloodstain or bloodstain pattern.

35. **Wipe Pattern** - An altered bloodstain pattern resulting from an object moving through a preexisting wet bloodstain.

END OF DOCUMENT
I. Illicit drugs and drugs of abuse can include a variety of substances whether they are common over the counter substances, prescribed pharmaceuticals, or illegally manufactured and cultivated substances. Drugs are commonly encountered at crime scenes, during property searches, and on persons of interest. Suspected narcotics may be directly related to the crime scene incident or may be of secondary nature to the crime scene. Regardless, in special instances, the immediate analysis of drugs may be crucial to an investigation. Due to potential safety hazards of drugs, care and caution must be taken during collection and packaging. A drug is defined as any substance that can alter a person’s physiological response. A person’s demeanor, judgment, or well being may change. Any suspected drug that is encountered at a scene or on a person may be collected if it is deemed pertinent to the investigation.

A. Safety: Caution must be taken when working with solid dose narcotics. Drugs in powder form can be inhaled (e.g. cocaine) and drugs suspended in liquid can be absorbed transdermally (e.g. Lysergic Acid Diethylamide (LSD), Phencyclidine (PCP)), all causing ill effects on a person.

1. Gloves must be worn at all times when handling suspected drugs.
2. Disposable respirators maybe used with liquid forms of drugs due to fumes.
3. Clothes should be laundered to prevent any further transfer of solid dose drugs from a scene.

B. Procedure for Drugs Encountered on Scene or at Autopsy

1. If a suspected narcotic is encountered on scene, the best practice is to place the narcotics in a secondary container that is appropriate for the drugs encountered (i.e. plastic bag or paper bindle for powders and pills, paper bag or paper bindle for plant material, glass container for liquids).
   a. A secondary container is not always necessary depending on how the drug is encountered.
   b. The narcotics may be placed in a controlled substance envelope if one is available.

2. Drugs found on scene should be relinquished to the lead investigator for safe transportation.
   a. Document through notes and photographs the item that is relinquished.
   b. The lead investigator should be instructed, if he/she has not already done so, to place the suspected drug in a controlled substance envelope, fill out the request on the envelope, and return it to the laboratory for analysis if desired. All scene responders should avoid transporting suspected drugs when possible.

3. In cases of bulk amounts of narcotics, the AGENCY should be notified to assist, collect, and transport the narcotics and submit a representative portion to the lab for analysis.
   a. Document through notes and photographs the narcotics encountered at the scene.

C. Drugs Encountered at the Laboratory

1. Drugs may be found in a person’s clothing or concealed in an object when taking inventory of evidence at the laboratory. A crime scene responder must place the suspected drugs in a controlled substance envelope and must contact the lead investigator to obtain authorization for analysis of the substance. The responder must complete the controlled substance envelope and attach a phone log or fax from the lead investigator indicating authorization of analysis.

2. The suspected drug evidence will be entered as an item in LIMS along with the other evidence collected. The evidence description can be labeled as ‘Controlled Substance Envelope’.

3. The item will be transported to the Muir Laboratory Facility and placed in the Muir Log-in storage to be further processed by the clerical staff.

D. Special Instructions

1. The laboratory does not routinely accept or analyze drug paraphernalia. Special circumstances must exist for the laboratory to analyze paraphernalia. The lead investigator must seek Supervisor/Manager approval to determine
if paraphernalia can be submitted to the laboratory for analysis. Relinquish paraphernalia to the lead investigator. Suggest removing any solid dose narcotics (if possible) and submit any removed solid dose drugs to the laboratory for analysis.

END OF DOCUMENT
I. Forensic entomology is the use of insects, and their arthropod relatives, that inhabit decomposing remains to aid legal investigations. Their collection and preservation may be important to estimate time of death.

A. Introduction: A proper collection of entomology evidence can provide data for a forensic entomologist to calculate the time of death. It is crucial that the crime scene analyst follow the proper steps of collection and record the appropriate information. Some insects have evolved a gradual or "paurometabolous" development in which there is an egg that hatches into an immature or "nymph" form, which resembles the adult form, but is smaller and lacks wings. However, most forensically-important insects undergo a complete or "holometabolous" development. There is an egg stage which hatches into a larval form and undergoes an incremental growth. This pattern is caused by the successive molts that the larva must undergo before it finally enters the inactive pupal stage. The pupa is simply the hardened outer skin of the last larval stage and the adult will develop inside of this protective skin.

1. Blow Flies: In the insects that undergo complete development, the larval stages appear quite different from the adult form. The larvae of flies that are commonly recovered from decomposing human remains lack functional legs, and the body of many species appears cream colored, soft-bodied, and quite "maggot-like". Once the larva is through feeding, it will migrate away from the corpse in order to find a suitable site to form the pupal stage. If the adult insect has emerged, one end will appear as if it has been cut off, and the hollow interior will be revealed. Most adult blow flies appear a metallic green or blue and are easily recognizable.

2. Beetles: Beetle larvae recovered from corpses can be easily differentiated from maggots as they have 3 pairs of legs and the maggots found on decomposing remains will not have any legs. The bodies of beetle larvae may range from almost white, robust, and hairless to dark brown, slender, and quite hairy. Others may appear almost black and have armored plates on their back.

B. Equipment:

1. Collecting vials.
2. Sweep insect nets.
5. Solution (ethyl alcohol ~95%) to preserve specimens.
6. Hand trowel for soil sampling.
7. Forceps (tweezers).
8. Paper labels – use pencil to mark the labels.
9. Shipping containers.
10. Log sheets.

C. Procedure: There are four major steps need to follow for collection and preservation of entomology evidence.

1. Visual and initial data collection
   a. Document the condition of the decedent with photographs and notes at the scene– (e.g. fresh, bloated, active decaying, any wounds).
   b. Detailed site description: rural, urban, aquatic habitat, condition of windows, etc.
   c. The position of the body, including where there would be sunlight and shade in the crime scene area during a normal daylight cycle.
   d. Initiation of temperature data collection at the scene which includes body surface, ground surface, under-body interface, soil, maggot mass, ambient, and enclosed structure. The current weather conditions at the
site must be noted. Thermostat settings should be noted in dwellings.

e. Document observations and estimates of the number of flying, resting and crawling insects, and larvae or pupae within close proximity to the body. Note locations of major insect infestations associated with the body or surrounding areas. Insect activity may begin around an area of trauma.

f. Search surrounding areas for maggot tracks and document any accumulation of maggots or pupae (e.g. on baseboards and window sills).

2. **Collecting Climatological data at the scene**

a. When estimating the time death, climatological data about the crime scene is absolutely critical. The length of the insect life cycle is determined mostly by temperature and relative humidity in the environment development takes place. There are several temperature readings that should be taken in association with the death scene.

i. Ambient temperature can be evaluated by taking readings at 0.3 to 1.3 m heights in close proximity to the body.

ii. Ground temperature can be obtained by placing the thermometer on the ground, immediately above any surface ground cover.

iii. Body surface temperature is obtained by placing the thermometer on the skin surface.

iv. Under-body interface temperature is obtained by sliding the thermometer between the body and the ground surface.

v. Maggot mass temperatures can be obtained by inserting the thermometer into the center of the maggot mass.

vi. Soil temperatures should be taken immediately after body removal at a ground point which was under the body before removal. Also take soil temperatures at a second point 1-2 m away from the body. These temperatures should be taken at 3 levels:

1. Directly under any ground cover (grass, leaves, etc.),
2. at 4 cm soil depth and
3. at 20 cm soil depth.

b. Weather data for the scene should be collected from the nearest meteorological station. Minimum requirements should be maximum and minimum temperature and amount of precipitation. The climatological data should extend back to the time the victim was last seen.

3. **Collection of Specimens Before Body Removal**

a. An insect net can be used to collect flying insects. For the fast flying adult flies, use an aerial net.

i. Fill a vial half way with 95% ethyl alcohol.

ii. Sweep back and forth over the remains in swift sweeping movements, and then quickly trap the adults in the tail of the net by grabbing it with one hand.

iii. Hold the tail of the net up with one hand while moving the vial inside the opening of the net to trap the flies.

iv. If needed, pour more alcohol to fully submerge the insects.

b. Collect as many ground crawling insects as possible from around the body and put them in a vial. Pour 95% ethyl alcohol into the vial to fully submerge the insect mass after collection.

c. Once the surrounding area has been processed, collection of specimens from the body can begin. Scoop a representative sampling of larvae as well as egg masses from various areas of the body in glass vials. Pour 95% ethyl alcohol into the vial to fully submerge the insect mass after collection.

d. If desired by the Forensic Entomologist, and only if prompt transfer is assured, scoop another sampling of the maggot mass into a ventilated container and stored refrigerated.

4. **Collection of Specimens After Body Removal**

a. When a body is heavily infested at an outdoor scene, many insect adults, larvae, and pupae will remain on the ground after the body is removed. These specimens should be collected and preserved.

b. Any material (leaves, grass, bark, etc) on the ground surface close to or under the body should be collected and labeled.
c. Soil samples should be collected from under and around the body. Dig from the edge of the body and work outward, approximately 3-4 m to look for pupae. The larvae will migrate away from the corpse upon completion of their feeding.

D. **Shipment of Live Larvae**

1. First contact the Forensic Entomologist to see which way they prefer the insects to be shipped or delivered. Put all collection containers in a box with ice and ship them to the Forensic Entomologist via overnight delivery or deliver it directly.

E. **Entomology Evidence Collection Using the Lynn Peavey Collection Kit**

1. **Lynn Peavey provided the following instructions for use with their kit:** Entomology evidence recovery or collection techniques used should be the most direct and practically the least intrusive techniques. The collection kit contains two types of solutions. Solution A is used for preservation of the adult flies, adult beetles, beetle larvae, and fly puparia. Solution B is used for preservation of fly eggs and maggots (larvae). The collection vial should be labeled with the Lab Number, date of collection, location, and collector’s initials. The adhesive labels marked Solution A and Solution B should be filled out and placed on the appropriate vials and the matching copy label should be filled out and placed in the vial with the specimen. Use only pencil in filling out the labels (ink will run or dissolve in the solutions).

2. **Adult Insects**
   a. The first insects that should be collected are the adult flies and beetles.
   b. Using Solution A, fill a screw cap vial 1/3 full.
   c. For the fast flying adult flies, use an aerial net.
      i. Sweep back and forth over the remains in swift sweeping movements, and then quickly trap the adults in the tail of the net by grabbing it with one hand.
      ii. Hold the tail of the net up with one hand while moving the vial inside the opening of the net to trap the flies.
   d. For ground crawling beetle larvae, adults, and fly puparia, place them into vials 1/3 full of Solution A.
   e. Submerge all insect masses with Solution A if necessary.

3. **Fly Eggs and Larvae**
   a. Scoop as many eggs or larvae into a vial to provide an adequate specimen representation.
   b. Make separate collections from each major area where colonies are seen.
   c. Submerge all insect masses with Solution B.

END OF DOCUMENT
The successful recognition and recovery of human skeletal remains is important in determining the identity of the individual, as well as providing investigators with forensic evidence in which to further their investigation. Proper techniques must be employed in order to retrieve as many bones of the human body as possible. Those aspects of this procedure that are applicable will be dictated by the requesting investigator, the Coroner’s Investigator, and the District Attorney’s Office Personnel. The Coroner’s Investigator is responsible for the removal of the body from the scene.

### Preliminary Considerations

Before traveling to the site of possible human skeletal remains, certain queries must be made in order to assess the scope of the recovery.

1. Does the investigating agency have legal permission to be present on the land?
2. Is the area safe and secure?
3. Is the body completely buried? Partially exposed?
4. Can vehicles access the area? If not, what accommodations have been made to transport investigators and workers to the site?
5. Has the Coroner’s Office been notified? Is a representative from the Coroner’s Office available to be on-site?

### Equipment

1. Rakes
2. Flat-headed shovels
3. Trowels
4. Paint brushes
5. Tongue depressors
6. Survey flags
7. Measuring tape
8. Stakes
9. Colored string
10. Canvas or heavy plastic sheets
11. Sifting screens
12. Camera and memory card
13. Grid paper
14. Notebook
15. Paper bags
16. Cardboard boxes
17. Packing tape
18. Duct tape
19. Ink markers
20. Evidence tape
C. **Safety**: Appropriate personal protective equipment should be worn to reduce exposure to bloodborne and airborne pathogens.

D. **Search Techniques for Human Remains**: Visual cues may lead investigators to the site of a clandestine grave. Initially scanning the landscape to discern baseline topography may allow the analyst to recognize irregularities in both the ground surface structure and the vegetation.

1. **Differences in vegetation and soil.**
   
   a. **Disturbed vegetation.** Whenever a hole is dug in the ground, the vegetation in and around the hole is disturbed. Look for: unnatural succession of plants, disruption of root balls, unusual plant locations, “staged” appearance to natural vegetation. This will be seen with recently buried remains.
   
   b. **Soil compaction.** The natural decomposition of the buried remains will leave a void in the soil. Through time and rain, the soil above the remains will sink to fill the void, thus forming a depression in the surface above the body. Look for: primary or secondary burial depressions, sunken soil. This will be seen with remains that have been buried for a significant amount of time.
   
   c. **Soil disturbance.** When a grave is dug, the layers of the soil are disturbed. The soil under the ground is layered. At different depths, the soil will vary in color and represent the different layers of soil. Digging not only disturbs the soil layers in the grave, but also disturbs the surface soil around the grave. Look for: broken ground, fresh surface soil, disruption of strata.
   
   d. **Other inconsistencies**: Look for: tire tracks, garbage, animal burrows, clumps of hair or fibers, clothing.

2. **Aerial Photographs**: Aerial photos could show a vegetation disturbance occurring where a body is buried.

3. **Ground Penetrating Radar (GPR)**: GPR uses high-frequency radio waves and transmits into the ground. When a wave hits a buried object the receiving antenna records the variations in the reflected return signal.

4. **Metal detector**: Metal detectors can be helpful if metal or bullets are in and around the grave.

5. **Cadaver Dogs**: Some dogs are trained to detect the scent of decomposing bodies.

6. **Test Pits**: When an investigator has a reasonable belief that human remains are buried in an area but there are no obvious signs pointing to the location, test pits may be dug in an attempt to locate the remains.

E. **Recovery Site**: An evidence-free access route to and from the site must be established prior to processing. Extreme scattering of the bones/body parts or physical evidence by animals frequently occurs. Therefore, an outer perimeter search must be completed to locate other body parts or physical evidence.

F. **Excavation**: There are three primary methods of excavating the ground around the body and the body itself.

1. **Hole**: As the name indicates, a hole is dug, uncovering the remains as the soil is removed from over and around the body.

2. **Trench**: A trench is dug next to the remains to a depth of 18 inches below the upper body level. The trench must be at least the length of the body and approximately 18 inches wide. Using this method, three of the four walls of the grave can be defined.

3. **Table**: A table is dug by trenching all around the body, usually leaving a table approximately three and a half feet wide by six feet long and extending a foot and a half beyond the depth of the body. This method will leave all four walls of the grave intact.

4. A variety of shovels can be used during excavation; however, as you get closer to the remains, change to smaller digging instruments.

G. **Surface scatter**: Remains are left to decompose above ground or are only buried in a shallow grave. These types of scenes may be large in scope and may encompass a large amount of corresponding physical evidence. In addition, carnivorous scavengers may have relocated a large number of skeletal elements over a large area. General procedures to conduct a surface scatter site recovery are as follows:

1. If scavengers appear to have disturbed the remains, be cognizant of where animals take food to feed (underneath trees, in burrows, where they can see danger approaching, etc.)

2. Flag with survey flags any unusual items and evidence found in the field, including clothing, bones, garbage, debris, etc.

3. Locate a fixed point in the landscape to perform the appropriate measurement technique(s). Be sure to record all three dimensions, as appropriate.

4. Determine which items previously flagged are of evidentiary value to the case.

5. Place number or letter placards next to each item of forensic value, photograph and diagram
6. Collect all human remains in paper containers, being careful to correctly label and seal all packaging. Note, this may be done by laboratory staff or by the investigator from the Coroner's Office.

7. Release all other items of evidence to the investigating agency.

H. **Interred Remains**: Remains left below ground. The depth is of no importance in this classification. These types of scenes, although more compact in nature, pose an additional challenge of documenting a three-dimensional environment. General procedures to conduct a burial site excavation are as follows:

1. Remove excess leaf litter and vegetation from the grave surface.
2. Examine the leaf litter and vegetation for trace evidence (hair, clothing, jewelry) in a location away from the burial site.
3. Stake out a work area around the burial area for diagramming and measuring purposes.

II. **Documentation**

A. Once the remains have been located and the recovery site defined, proceed as with any other crime scene: secure the area, examine and evaluate the site, photograph, sketch and process. Document the position and location of the body within the scene through notes, photographs, sketches, and measurements to reference points.

B. A grid may be set up with rope or string for the purpose of locating the items by measurements and for ease in placing the items on a sketch.

C. Stations may be setup to sift through dirt and debris. Generally several inches of dirt from one quadrant can be sifted at once.

D. Plot all evidence and remains on the sketch.

E. Close-up photographs should be taken of all items before their removal. If items are located when sifting through the dirt, photograph the item when it is located.

F. The analyst must obtain approval from the Coroner's Office before removing any transient evidence located on the body (i.e., trace evidence, biological fluid or stain, impression evidence).

G. The analyst must obtain approval from the Coroner’s Office before removing any clothing. If removing clothing, remove by cutting along an area free of defects or by removing intact, as circumstances dictate. Package articles of clothing in separate paper bags.

H. If there is potential evidence on the hands, the coroner’s investigators should place a paper bag over each hand and secure with tape prior to removal of the body.

I. If a sexual assault is suspected to have occurred, consider examining the body with an alternate light source.

J. Bindings and ligatures should not be disturbed, unless they attach the body to the scene. Minimize the number of cuts to bindings necessary to release the body from the scene. Never cut through a knot. Tape and label ends of ligatures or bindings that were cut by investigators.

K. Always dig at least one foot below the depth of the body to ensure all evidence is located.

III. **Collection of Evidence**

A. The specific location of any evidence recovered will be documented in context (x, y, and z coordinates).

B. All evidence collected should be packaged separately.

C. The remains of the deceased should be packaged separately; if that is the way they were found.

D. If the body is intact, use a wooden backer board, white sheet and new body bag.

E. The easiest method of removing the body is to wrap it in a white sheet and place it into wooden backer board before removing it from the grave. This will keep the body intact and make transportation easier. Several centimeters of the soil beneath the body must also be removed and sifted again to locate evidence, bones, projectiles and teeth which may be present.

F. While it is the Coroner's Office responsibility to recover all human remains, the crime scene responder should share the best practices when it comes to recovering buried bodies.

END OF DOCUMENT
I. Crime scene processing activities must be documented by means of a Laboratory Report. Reports must be accurate, precise, and complete for the given type of crime scene processing performed. Any opinion or interpretation in the report must have documentation in the test record to support it. Both negative and positive results of tests and searches must be reported.

A. Report Header
   1. The report will contain the same required header information as specified in FSD.43.
   2. Verify the agency name and case number, case type, requester and request date, and the names of victim(s) and suspect(s) are correct. Wrong information in the header must be corrected.

B. Report Outline (Body of Report):
   From the "Edit findings" menu, select result type "Field Services." This will populate the "Report of Field Services" header in the body of the report.
   The following are the recommended sections in the body of the report and what each section should contain:
   1. General Information:
      a. Laboratory personnel: a list of staff who responded to the scene.
      b. Date and Approximate Time of Arrival & Departure:
      c. Location of Scene: address of scene or addresses if more than one location
      d. Investigator(s) Present: to include DAs, Detectives, and Deputies and Officers of significance
   2. Activities Performed:
      a. Typically: Documentation with notes, photographs, and laser scans. Evidence collection; see evidence section below.
   3. Observations and Findings:
      a. Significant observations, opinions, and interpretations from the scene. This includes the results of tests performed on scene (e.g. presumptive blood tests) for both positive and negative results. Positive and negative control information is not required to be included in the report but must appear in the notes. Any opinion or interpretation in the report must have documentation in the test record to support it.
   4. Recommendations:
      a. This optional section may be used to notify the agency of recommended follow-up. For example, what evidence could be submitted for further analysis.

C. Evidence inventory in report
   1. All collected evidence items with their descriptions and tracking numbers shall be in LIMS (see CS.21).
   2. Location from where the item was collected.

D. Atypical situations that require inclusion in the report
   1. Methods used to collect evidence will be noted if unusual.
      a. For example, a door with apparent bloodstains may not be feasible to completely cover and tape seal. The evidentiary areas must be protected from contamination and these unusual methods must be reported.
   2. The evidence items that are documented but were not collected:
      a. For example, photographing and taking notes on an officer involved in a shooting who had no physical contact with the suspect.
E. **Disposition of Evidence**
1. Evidence submitted to technical units.
2. Any copies of photographs created.
3. Storage and copies of any electronic diagrams or data generated by the lab or outside agency relied upon during the preparation of the report.

F. **Style of report**
1. Both first person (e.g. "I noted apparent bloodstains on the pillowcase") and third person (e.g. "Apparent bloodstains were noted on the pillowcase") are acceptable viewpoints. Using active voice sentences is preferred when possible.
2. The report should be consistent in style. Avoid switching back and forth between first and third person viewpoints within the same report.

G. **Formatting**
1. Use the Times New Roman font, size 12.
2. Bold, italic, or underlined text should not be used, unless quoting or creating subsections.
3. The text should be Left-aligned with single paragraph spacing.
4. There will be a single empty space between paragraphs.

H. **Review and Dissemination**
1. The second crime scene responder should do a second read of the report prior to the report being submitted for technical/administrative review. If there was no second responder, the reports may be submitted directly for Technical and Administrative review.
2. All written reports will be technically and administratively reviewed prior to being released.
3. The administrative review milestone in LIMS reflects both the technical and administrative review of the request.
4. The primary crime scene responder will include the crime scene review checklist as the last page in their note packet. See CSF.02.

I. **Case Notes**
1. The note packet should be organized as follows:
   a. Assignment Notification Sheet
   b. Communication Logs (if appropriate)
   c. Field Services Information Sheet
   d. Notes
      i. Field Notes
      ii. Sketch
      iii. Measurements
      iv. Annotated photographs
         1. Photographs should be annotated with the filename, date taken, and a short description of the content of the photograph.
   e. Autopsy Checklist (if appropriate)
   f. Copy of Property/Clothing Evidence Inventory Sheet (if appropriate)
   g. LIMS Evidence Inventory Sheet
   h. Photo Thumbnail Sheets
      i. Crime Scene Review or Autopsy Review Checklist
2. While this is the preferred order, case circumstances may require a different organization of the note packet.

END OF DOCUMENT
I. The Crime Scene Unit uses a variety of equipment to preserve, document and collect evidence. This policy describes the equipment and its maintenance schedule (if applicable). No critical measurements are recorded by the Crime Scene Unit.

A. Common crime scene supplies and equipment (swabs, envelopes, bags, etc.).
   1. Used for evidence collection and/or measurement.
   2. Replace as needed.

B. Common tools (hammers, punches, screwdrivers, Dremel, reciprocating saw, etc.).
   1. Used to access or collect evidence, for example remove wall section to access bullet.
   2. Repair/replace as needed.

C. Canon Digital SLR Camera (20D, 40D, 50D, 60D, or similar).
   2. Repair or replace as needed.
   3. See manuals: INSCS.01, INSCS.02, INSCS.03, and INSCS.04.

D. Tape measures and rulers (scales)
   1. Prior to issue, all rulers and tape measures will be verified against a NIST calibrated ruler.
   2. Packs of scales with adhesive backing do not need to be verified prior to issue.

E. Handheld laser measuring device (Hilti or Leica brand).
   1. Measure evidence and/or dimensions of scene.
   2. Accuracy verified annually.
   3. Replace batteries as needed.

F. Leica laser scanner or equivalent
   1. Measures evidence and dimensions of a crime scene.
   2. Replace batteries as needed, update software and calibrate as needed.
   3. A log will be maintained on all repairs and software upgrades.
   4. See manual and user guides: INSCS.05, INSCS.06, and INSCS.08.

G. Electrostatic dust print lifter, adhesive lifter, gel lifter
   1. Used to visualize and collect shoe prints off of surfaces
   2. Ensure that electrostatic dust lifter is charged

H. Entomology Collection Kit
   1. Used to collect samples of insects and larvae.
   2. No expiration date as provided by vendor.

I. Alternative Light Source
1. Aids in visualization of biological stains and in locating trace evidence.
2. Replace batteries as needed

J. Casting material (ForensicSil, Mikrosil, Dental Stone)
   1. Used to cast impression evidence that can not be collected.
   2. As provided by vendor.

   END OF DOCUMENT
I. The Crime Scene Unit uses a variety of reagents for presumptive tests and documentation purposes. The method of preparation, procedure for use, and expiration are contained in this policy.

A. Ortho-Tolidine (O-Tol): Presumptive blood test
   1. Source: The reagent is prepared by the Forensic Biology Unit (refer to BIO.5.QAQCF.14 for recipe for o-Toldine working solution and Hydrogen Peroxide).
   2. Prior to use, the solution must be tested with a positive (known blood) and a negative (reagents alone) controls.
   3. The expiration of the solution is 18 months from date of preparation and will be marked on the bottle.

B. Hemastix: blood test
   1. Source: These are purchased ready to use from a vendor.
   2. Prior to use, Hemastix must be tested with a positive (known blood) and a negative (reagents alone) controls.
   3. The expiration of Hemastix is as specified by the vendor.

C. Acid Phosphatase: semen test
   1. Source: The Acid Phosphatase buffer solution is prepared by the Forensic Biology Unit (refer to BIO.5.QAQCF.13 for recipe for AP Substrate and BIO.5.QAQCF.12 for recipe for Acetate buffer).
   2. Prior to use, Acid Phosphatase must be tested with positive (known semen) and negative (reagents alone).
   3. The expiration of the solution is 1 month and will be written on bottle.

D. Luminol-based reagent (Bluestar): blood enhancement reagent for detection of old or dilute bloodstains
   1. Source: purchase Blue Star from vendor (Evident)
   2. Prior to use, Bluestar must be tested with positive (known blood) and negative (reagents alone) controls
   3. The expiration is as specified by the manufacturer.

E. Leucocrystal Violet (LCV): blood enhancement for visualization/enhancement of fingerprint or shoeprint impressions in blood
   1. Source: vendor (Evident)
   2. The expiration is as specified by manufacturer

F. Sodium Rhodizonate: presumptive lead test
   1. Source: purchase lead check swabs from vendor.
   2. Use positive (known lead) and negative (reagents alone) controls prior to use.
   3. The expiration is as specified by manufacturer.

END OF DOCUMENT
I. The following are the approved abbreviations for the Crime Scene Unit.

⊥ - perpendicular to (orthogonal)
// - parallel
∠ - angle
- (-) - negative
+ (+) - positive
@ - at
ADDL - additional
ADW - assault with a deadly weapon
AF - Asian female
AFA - Asian female adult
AFJ - Asian female juvenile
ALPR - automated license plate reader
ALS - alternative light source
AM - Asian male
AMA - Asian male adult
AMJ - Asian male juvenile
AMT - amount
ANG - angle
APB - all point bulletin
APP - apparent, appears
ASSUM - assuming
AVE - avenue, average
AVG - average
BSEK - buccal swab evidence kit
BET, B/W - between
BF - black female
BFA - black female adult
BFJ - black female juvenile
BK, BLK - black
BLVD - boulevard
BM - black male
BMA - black male adult
BMJ - black male juvenile
BOLO - be on the lookout
BPB - brown paper bag
BR, BRN - brown
B/W - between
CAPT - captain
CB or CDBD - cardboard box or cardboard
CCME - clasp-closed manila envelope
CCRM - Contra Costa Regional Medical Center
CCSE - clasp-closed soil envelope
CD - compact disk
CE - coin envelope
CHAR - characteristics
CIR - circle
CMDR - commander
COLL - collected
COMP - comparison
CONS - conservative
CONT, CONTG, C - containing
CONT, CONT'D - continued
CORR - corresponding
CPL - corporal
CPR - cardiopulmonary resuscitation
CRIT - criteria
CSO - community services officer
(D) - deceased
DEF - defined
DEMO - demonstrate
DEP - deputy
DES - designated
DESC - description
DET - determine(d) or detective
DI H₂O - deionized water
DIAM. - diameter
DIFF - different
DK - dark
DL, D/L - drivers license
DOB - date of birth
DTO - dithiooximide
DUI - driving under the influence
DV - domestic violence
DVD - digital video disc
EB oe E/B - eastbound
ENV - envelope
EtOH - ethanol
EVID, EVI - evidence
EXT - exterior
FECK - Fingernail Evidence Collection Kit
FOB - Field Operation Bureau
FP - fingerprint
FPE - fingerprint envelope
FRAG - fragment
FTO - field training officer
GOA - gone on arrival
GRN - green
GSR - gunshot residue
GSW - gunshot wound
HBD - has been drinking
HF - Hispanic female
HFA - Hispanic female adult
HFJ - Hispanic female juvenile
HM - Hispanic male
HMA - Hispanic male adult
HMJ - Hispanic male juvenile
VIN - vehicle identification number
VIS - visual
VS - versus
W/ - with
W/I - within
W/O - without
WB or W/B - westbound
WCDF - West County Detention Facility
WF - white female
WFA - white female adult
WFJ - white female juvenile
WHT - white
WM - white male
WMA - white male adult
WMJ - white male juvenile
WKSHT - worksheet
XFER - transfer
XR - cross-reference
XS or X/S - excess or cross street
XTALINE - crystalline
YEL - yellow
ZLPB - ziplock plastic bag

END OF DOCUMENT
I. The Crime Scene Unit adheres to the Division Policy in regards to evidence handling and chain of custody requirements. Unit specific procedures are described here.

A. All evidence collected at crime scenes will be tracked in LIMS, with the exception of evidence items collected and released to an agency's representative at the scene.

1. Evidence may be collected and released to an agency's representative at the scene. Prior to release of evidence the following steps must be taken.
   b. Document the description of the evidence, collection location, person collecting it, and the date of collection on the exterior packaging.
   c. Tape seal the evidence prior to its release.

2. After the chain of custody has been signed by the agency representative, take a photograph of the label and signed chain of custody in lieu of an evidence receipt.

B. For evidence transported to the lab:

1. Document the chain of custody on the exterior packaging of the evidence.

2. Document the description of the evidence, collection location, person collecting it, lab number, and the date of collection on the exterior packaging.

3. The evidence will be logged into LIMS within a reasonable time frame. See CS.02 for time frame requirements.
   a. The first line on LIMS chain needs to be entered to match the chain listed on the hard copy chain on the exterior of the package.
      i. LIMS will take the default date when the evidence is being logged in. It is the responsibility of the person logging in the evidence to ensure the dates on the electronic chain match that on the package.
     b. The description of the evidence and location of collection must also appear in the LIMS evidence description.
        i. The chain of custody in LIMS for crime scene evidence collected by crime scene responders will begin with the Agency Representative as "Crime Scene" and then be transferred to the crime scene responder.
        ii. For evidence collected from Coroner's, the Agency Representative should be listed as "Autopsy", "Crime Scene", or the Pathologist's name as appropriate.

4. Tape seal the evidence prior to its transfer to a storage location.

C. Evidence storage requirements.

1. Evidence must be stored appropriately to prevent deleterious change.

2. Blood/urine must be refrigerated. After logging the evidence into LIMS, the incoming refrigerator is the most appropriate storage location.

3. Swabs must be air dried prior to packaging.
   a. If submitting for analysis, swabs may be placed in Log-In at room temperature along with the request for analysis.
b. If no analysis is needed, swabs should be placed in the Return Freezer.

4. Wet clothing must be air dried prior to packaging.

5. Refer to the individual crime scene policies for further information (Biological Evidence, Firearms, Latents, Autopsy, Vehicle, Impressions, Trace, Drugs)

D. Crime scene responders may bring crime scene evidence back to the laboratory and continue processing or presumptive screening tests at the laboratory if the following conditions are met:

1. The evidence must have been collected by laboratory staff at the crime scene.

2. The processing or presumptive screening may only be performed by the crime scene responder(s) that responded to the scene (e.g. a second could perform the test even if the primary collected it).

3. The crime scene responder is appropriately competency and proficiency tested.

4. The time period between collection and processing in the laboratory is reasonable.

5. The limitations to any presumptive testing are appropriately qualified in the report.

E. Images as evidence.

1. Images taken for comparison examinations must be taken in a lossless format and treated as evidence. Refer to FSD.42.01 for division requirements.

2. All other documentation images taken at crime scenes are not considered evidence.

   a. When a subsequent analysis requires documentation images to be treated as evidence (such as a reconstruction), the analyst will export the original documentation images from Veripic, burn them to disc, and treat them as evidence. The initial transfer will be from "Veripic" (under the Forensic Services Division agency in LIMS) to the analyst on the date that the images were exported.

   b. If a request for subsequent analysis exists at the time of the original crime scene, then the crime scene responder will treat the images as evidence as described in a, above, but beginning the chain with "Crime Scene" instead of "Veripic."

END OF DOCUMENT
I. The following procedures will be used by staff to generate laboratory case numbers for crime scene call-outs generated after hours and on weekends and for evidence inventory lists for inclusion in note packets.

A. A Laboratory Information Management System (LIMS) Administrator will reserve lab numbers from LIMS as needed.
   1. The lab numbers may be reserved using a defined convention and/or based on operational needs. Unused lab numbers may be recycled by year's end.
   2. The nomenclature will include the year and all leading zeros to enable searching using the LIMS case mask e.g. - 18-00500 or 18-01150.
   3. The lab numbers will be reserved under the agency name of "Crime Scene".

B. Reserved lab numbers will be accessible from the Google Drive Crime Scenes folder.
   1. The list of reserved lab numbers will be uploaded on the secure Google Drive folder, which will be easily accessible from bookmarks saved on the crime scene iPhones and clerical kiosk tablet.
      a. Open the Google Drive app and the Crime Scenes folder to locate the list of reserved lab numbers in a spreadsheet.
   2. Staff will use the reserved crime scene lab numbers sequentially and place their initials on the spreadsheet in Google Drive, to indicate that the lab number has been used. When multiple scenes occur, the crime scene responder will take the next available reserved lab number.
   3. Crime Scene responders will communicate the agency case number to clerical staff in a timely manner to prevent multiple lab numbers from being erroneously drawn for the same case.

C. All note packets will include a list of evidence collected and logged into LIMS by the crime scene responder.
   1. This list can be generated by going to Administration, Crystal Reports, and Generate Reports. Change the category to crime scene and select the "Crime Scene Evidence Inventory" crystal report.
   2. Select print, choose your option (default printer, other printer, or screen), click in the "Enter a Value" box, and then scan the barcode of the request.
   3. Note, some findings must be entered under the request in order for the report to print.

END OF DOCUMENT
I. Purpose: The primary purpose of this unit of training is to introduce the trainee to the aspects of crime scenes including requests, vehicles, radio use, and crime scene team expectations.

A. Objectives
   1. Understand the scientific methodology used in Crime Scene analysis.
   2. Understand the differences between class and individual characteristics as they relate to physical evidence.
   3. Understand the scientific foundation behind the collection and preservation of physical evidence.
   4. Be familiar with legal aspects that govern crime scene processing.
   5. Understand the procedures for operation and maintenance of the crime scene vehicle and equipment.
   6. Prioritize the response to multiple requests.
   7. Recognize that a crime scene responder may function as a technical advisor.
   8. Explain the operation of the various forensic science disciplines and be able to identify the types of evidence they examine.
   9. Know the proper use of personal protective equipment.
   10. Know the proper use of facility protective equipment.
   11. Know the proper use of storage and handling of chemicals.
   12. Be able to communicate the safety procedures whether in the laboratory or outside at a crime scene.

B. Study Questions
   1. Define physical evidence
   2. What are the various types of crime scenes that a responder may be requested to document in the performance of their duties?
   3. Define the role of the crime scene responder.
   4. What is Locard's Exchange Principle?
   5. Explain the linkage triangle.

C. Practical Exercises
   1. Identify the exams used to analyze those various types of evidence. This may be accomplished by temporary assignment to each of the following sections of the Laboratory for a block of time to be introduced to the types of evidence and examinations that take place within each discipline: Forensic Biology, Comparative Evidence, Latent Prints, Drugs, Alcohol, and Toxicology.

   2. Criminalistics: An Introduction to Forensic Science Richard Saferstein (GC-103d)
   3. Practical Homicide Investigation Vernon Geberth (GC-155)
   4. Techniques of Crime Scene Investigation Barry Fisher (GC-125)
   5. Saferstein Forensic Science Handbook Vol 1 (GC-132)
7. FSD Safety Manual

END OF DOCUMENT
I. The primary purpose of this unit of instruction is to address the initial actions taken by the Crime Scene Responder prior to and upon arrival at the scene. This unit will also discuss the skills necessary to coordinate a crime scene.

A. Objectives
   1. To understand what type of information is needed before responding.
   2. To understand what type of information is required on arrival at the scene.
   3. To understand the importance of properly searching for evidence.
   4. To become knowledgeable of and experienced with different search techniques and their applications at various types of scenes.

B. Study Questions
   1. What should be documented during the initial response request?
   2. What information should be documented or discussed upon arrival at the crime scene?
   3. How should the extent and scope of the crime scene be evaluated?
   4. What immediate precautions should be taken to ensure the successful collection of physical evidence?
   5. What types of systematic search techniques are commonly used when processing crime scenes?
   6. What types of specialized equipment can be used for crime scene searches? What is each piece of equipment used for?

C. Practical Exercises
   1. With your instructor acting as the lead investigator, review photographs from a real crime scene. Determine what special equipment would be useful. Discuss what you might collect, how you would collect it, and what follow-up examinations you would recommend to the detective.

D. Suggested Reading
   2. Crime Scene Investigation Goddard (GC-74)
   3. Handbook of Forensic Archaeology and Anthropology Morse, Duncan, Stoutamire (FM-38)
   4. Forensic Taphonomy Haglund (FM-52)
   5. Evidence and Crime Scene Reconstruction Rynearson and Chisum (GC-164)
   6. Techniques of Crime Scene Investigation Barry Fisher (GC-125)
   7. Fundamentals of Criminal Investigations O’Hara (GC-65)

END OF DOCUMENT
I. This unit of instruction is designed to provide the trainee with information on the proper documentation of a crime scene. The note-taking portion of this unit will emphasize to the trainee the importance of taking proper notes, not only at the crime scene, but also upon notification for assistance and during all follow-up work. The sketching portion of this unit is designed to develop basic skills in preparing crime scene sketches. Various techniques will be explained and demonstrated. The trainee will learn the proper procedures for obtaining accurate measurements necessary to complete a crime scene sketch. The initial photography portion of this unit is intended to develop the basic skills in the use of photographic equipment. It is designed to instruct the student in the type of photographic equipment that is available and the proper use of the equipment, as well as the lighting needed for good photography.

A. Objectives

1. To understand the importance of documenting crime scenes and the evidence therein by a combination of note taking, sketches, and photography.
2. To demonstrate the ability to document observations at a crime scene through note taking.
3. To demonstrate the ability to produce various sketches of crime scenes.
4. To develop the skills necessary for recording the location of evidence and its spatial relationship to other items in the scene through photography and sketches.
5. To correctly complete the Crime Scene Forms and electronic documentation (LIMS) required for crime scenes.
6. To understand the basic principles of photography, the types of photographs taken at a crime scene, and the methods for acquiring them.
7. To demonstrate the ability to operate photographic equipment successfully at a crime scene.
8. To understand the various methods of making and recording measurements at the crime scene.
9. To understand chain of custody and the need for chain of custody documentation.

B. Study Questions

1. **Note Taking:**
   a. Why is it important to document your observations and actions in writing?
   b. What type of information should you document when you arrive at the scene?
   c. List information that should be included in the description of the general scene conditions:
   d. In addition to describing the type and location of evidence, what information should be included in the description of the body, if present:

2. **Photography:**
   a. What is the purpose of crime scene photography?
   b. What is exposure?
   c. Describe how the exposure can be adjusted using shutter speed and aperture. What effects can shutter speed and aperture adjustment have on the resulting photograph?
   d. What are the three types of photographs that should be taken at a crime scene?
   e. What is the purpose of each type of photograph?
   f. What two close-up photographs of evidence items are necessary?
   g. Name three techniques for controlling flash output and shadow management.
h. What is the procedure for photographing the reaction of Luminol or Luminol-based reagents with blood?

i. What are the requirements for footwear impression photography?

3. Sketches:
   a. What are the purposes of diagrams/sketches?
   b. What are the main types of sketches?
   c. What measurements are necessary for the creation of a scaled diagram?
   d. What information should be included on the sketch?
   e. List the measuring devices and equipment useful for creating a sketch.
   f. List the three main reference methods used to diagram a scene and explain each method. What are the strengths/weaknesses of these methods?

C. Practical Exercises

1. Note Taking:
   a. Review examples of crime scene reports and notes.
   b. Explain why seemingly trivial observations observed in the example note packets were important.

2. Photography:
   a. Photograph a house or building as if it were the location of an outdoor crime scene. Be sure to establish location and identity, as well as walk around the house to get all exteriors. Also, remember to get pictures of other structures on the property and show their location with respect to the house.
   b. Photograph the interior of a house where a scene is located. Get all rooms, not just the rooms pertinent to the scene. Manipulate the camera and the light to properly expose the images regardless of the conditions of the room (dark walls, light walls, small room, etc.).
   c. Photograph a single room with multiple exhibits of interest (the “crime scene”). Be sure to use overall, medium range, and close-up photographs.
   d. Photograph a blood spatter pattern on a white wall, watching out for hot spots, focus, and establishing visual relationships between photographs.
   e. Photograph the following items related to processing a vehicle:
      i. VIN
      ii. License plate, front and back
      iii. External damage
      iv. Tire tread pattern
      v. Object in the anterior of the vehicle, through the windshield
      vi. A stain, defect, or object on the windshield
      vii. A stain, defect or object on the head liner
      viii. An object under the seat
      ix. Latent prints on a window, exterior of a door, and rearview mirror
   f. Photograph the following items: handgun, knife, footwear impression, tire impression, fingerprint, toolmark and blood trail.

3. Sketches: Create the following sketches and include all relevant measurements necessary for a scaled diagram to be produced (you do not need to produce the scaled diagram).
   a. An overview sketch of a furnished room with evidence placed at various locations/elevations throughout the room.
   b. An exploded view sketch of a hallway with evidence placed on the walls and floor.
   c. A 3-dimensional sketch of a piece of furniture with a knife protruding from it.
   d. An elevation sketch of a door or window where evidence of forced entry and fingerprints are located.
e. A sketch of an outdoor scene showing the relative positions of tire tracks and footwear impressions to the surrounding environment.

4. **Specialized Equipment:**
   a. Use the ALS to view various biological materials and other non-biological materials on different types of surfaces.
   b. Use the Leica laser scanner or equivalent to document a mock crime scene.

D. **Suggested Reading**
2. Crime Scene and Evidence Photographer's Guide (PH-41)
I. The following is the training procedure for crime scene photography.

A. Objectives

1. To become familiar with Principles of Photography including:
   a. Aperture and its influence on exposure
   b. Shutter speed and its influence on exposure
   c. ISO and its influence on exposure
   d. Starting points for ISO, aperture, and shutter speed for common lighting situations
   e. Various types of light and their color temperatures

2. To become familiar with the Digital SLR Camera System including
   a. The nomenclature of the Canon SLR camera system
   b. The nomenclature of the Canon electronic flash unit
   c. Digital imaging file formats
   d. The function and operation of a fixed focal length standard camera lens, telephoto lens, and macro lens
   e. The various photographic shooting platforms available to the photographer

3. To become familiar with Flash Photography including:
   a. the methods of controlling the flash unit
   b. the three primary angles of lighting commonly used in conjunction with the flash
   c. various techniques for controlling the effects of illumination from the flash
   d. situations when a flash is required when there appears to be enough ambient light

4. To become familiar with Specialized Photography Techniques including:
   a. evidence on highly reflective surfaces
   b. evidence on curved surfaces
   c. evidence on clear surfaces
   d. three dimensional impression evidence

5. To become familiar with low-light Photography including:
   a. a large outdoor crime scene by painting with light
   b. a large outdoor crime scene using a timed exposure technique
   c. a crime scene containing trace amounts of blood using luminol-based reagent
   d. the flight path of bullet trajectory in a crime scene using lasers

B. Study Questions

1. Identify the primary objective of crime scene photography and the documentation needed to ensure the admissibility of photographic evidence.
2. List the proper perspectives and compositions necessary during crime scene photography.

3. What is exposure?

4. What is shutter speed? What happens to exposure if you increase the shutter speed? Decrease? What is the trade off (possible negative effect) with shutter speed?

5. What is aperture? What happens to exposure if you increase the aperture? Decrease? What is the trade off (possible negative effect) with aperture?

6. What is ISO? What happens to exposure if you increase the ISO? Decrease? What is the trade off (possible negative effect) with ISO?

7. What are the three types of photographs that should be taken at a crime scene?

8. What is the purpose of each type of photograph?

9. What two close-up photographs of evidence items are necessary?

10. Name three techniques for controlling flash output and shadow management.

11. What is the procedure for photographing the reaction of Luminol or Luminol-based reagents with blood?

12. What are the requirements for footwear impression photography?

13. What are the four variables that affect exposure?

14. Why does changing one of them require an adjustment to one of the other exposure variables?

15. What are the two main reasons for changing exposure variables while maintaining the same exposure?

16. Explain white balance. How do different types of lighting affect the colors in your images?

17. Can a properly exposed crime scene photograph still be unsuccessful? Why?

18. Automatic focus has difficulties locking in on some types of scenes. Explain two situations in which it may be better to use manual focusing.

19. Explain the camera variables that affect depth of field, including those that maximize depth of field and minimize depth of field.

20. Explain which focal length of lens is considered a “normal” lens and why this is so. At what focal length (in mm) do you need to set a 16-35mm lens attached to a crop-frame sensor camera, such as a Canon 40D-80D?

21. Is there just one sync speed a camera can use with a particular flash unit? Although most cameras designate one shutter speed as that camera’s sync speed, can “faster” or “slower” shutter speeds ever be used with a flash?

22. Indicate one circumstance when it would be better to choose the automatic flash mode over the manual flash mode. Why?

23. Indicate one circumstance when it would be better to choose the manual flash mode over the automatic flash mode. Why?

24. In what circumstances does fill-in flash result in distinct benefits to exposure?

25. Explain all the concerns related to the photography of footwear impressions.

26. Briefly explain the types of exterior overall photographs.

27. Briefly explain interior overall photographs. What are some starting points for ISO, aperture, and shutter speed?

28. Midrange photographs have a specific purpose. Explain.

29. Explain the types of close-up photographs that should be taken of evidence.

30. Explain the “full body panorama” series of photographs.

31. What does the flash diffuser do to the flash? When should you use it?

32. What is a good lighting scenario to use Av (aperture priority) mode? Why?

33. What is a circular polarizer (filter) used for?

C. Practical Exercises

1. Properly photograph one item that is completely in the sun.

2. Properly photograph one item that is completely in the shade.
3. Photograph a building facade that is in the shade.

4. Place an interesting object on a vehicle dashboard and photograph it through the windshield with a polarizer filter used to eliminate the reflections on the windshield. From this same position, photograph the same object without the polarizer filter.

5. Place a coin on the sidewalk with the mint designation or date plainly visible. With the camera on a tripod, determine the best exposure using an aperture of f/22, f/16, f/11, f/8, f/5.6, f/4.0, and f/2.8.

6. On a day with bright sunlight, place an object by a car’s tire in the shadow.

7. Find or create a shoe print in dirt, place the camera on a tripod, and photograph it with the flash as directly as possible. Then, take a set of photographs with oblique lighting, changing the angle and position of the flash several times. Compare and contrast the images of the oblique flash with the direct flash.

8. In a bathroom, place several items around the sink and take a direct flash photograph. Next, use a bounce flash for the same scene, from the same position. Compare and contrast the images.

9. Take a picture of a smear on a mirror.

10. Take a series of photographs completely documenting two sides of a building.

11. Take a photograph or series of photographs relating the building in which a crime occurred to the surrounding area or neighborhood.

12. Take a series of photographs completely documenting two walls of a room.

13. With an item of evidence outside, take a midrange and close-up photographs of it.

14. With an item of evidence inside, take a midrange and close-up photographs of it.

15. Repeat with a reflective object, such as a license plate or knife blade.

16. With a body outside, take a midrange photograph and a complete body panorama of it.

17. On this body, draw a 1” “wound” and take a midrange photograph and a series of close-ups of it.

18. With a body inside, take a midrange photograph and a complete body panorama of it.

19. On this body, draw a 1” “wound” and take a midrange photograph and a series of close-ups of it.

20. **Fluorescence**

   a. As directed, photograph a fluorescing non-blood body fluid. Use the camera on a tripod, aperture priority, f/11, the alternate light source emitting blue light, and an orange filter on the lens. Alternatively, a long-wave UV light and yellow filter can be used. Include a partial fluorescent scale with your initials on it.

   b. As directed, photograph a bloody shoe print or handprint with Bluestar or luminol. This can be animal blood. Bleach may be used as a blood substitute. Photograph in complete darkness, with a flashlight briefly bounced off the ceiling during the exposure. A phosphorescent scale with phosphorescent initials can be included, as well as a penny and positive blood control. Exposure: Use the camera on a tripod, ISO 400, f/5.6, 90-second SS (45 seconds for bleach as a blood substitute); or a reciprocal exposure.

D. **Required Reading**

   1. The Practical Methodology of Forensic Photography (PH 41). Chapters 1, 2, and 7.

E. **Suggested Reading**

   1. [Photography Monograph](#)

   2. Photographic Evidence: Preparation & Presentation (PH 36)

   3. Forensic Uses of Digital Imaging (PH 40)

END OF DOCUMENT
I. The primary purpose of this unit of instruction is to introduce the trainee to the proper preservation, collection, and documentation of evidence that relates to the postmortem examination of human remains.

A. Objectives
   1. To understand the types and nature of evidence collected at post mortem examinations.
   2. To demonstrate the ability to photograph a postmortem examination.
   3. To demonstrate the ability to conduct a post mortem evidence search, and to recognize, collect and successfully preserve physical evidence from the body.
   4. Be able to utilize specific photographic techniques necessary for the documentation of identifying characteristics (i.e. bite marks, tattoos, wounds, stippling, enhancements, etc.).
   5. Explain the analytical possibilities concerning evidence obtainable from the autopsy.

B. Study Questions
   1. Where does the recovery of evidence from a body begin?
   2. What are livor, blanching and rigor? How are these post mortem body changes to be documented? Why is it important to note these changes?
   3. How should a body at a crime scene be prepared to protect against loss of evidence during transport to the Coroner’s office?
   4. List the types of evidence that may be found on a body.
   5. List and discuss the things that must be done pre-autopsy, during autopsy and post autopsy.
   6. What is the most important aspect and the most used evidence of an autopsy?
   7. Why are hands typically covered with paper bags prior to transport to the Coroner’s office?
   8. Why are paper bags used and not plastic bags? How should the bags be labeled?
   9. When should a discipline expert be called in to assist with a post mortem evaluation?

C. Practical Exercises
   1. Attend 3-5 autopsies.

D. Suggested Reading
   1. Forensic Pathology Dominick J. DiMaio, Vincent J.M. DiMaio (FM-48)
   2. Gunshot Wounds Dominick J. DiMaio, Vincent J.M. DiMaio (FI-41)
   4. Bloodstain Pattern Analysis Bevel (GC-177)
   5. Autopsy checklist

END OF DOCUMENT
I. The primary purpose of this unit of instruction is to introduce the trainee to the collection and documentation evidence when processing vehicles.

A. Objectives
   1. To understand the techniques for processing the interior and exterior of a vehicle.
   2. To understand the special conditions unique to processing a vehicle when compared with an interior crime scene.

B. Study Questions
   1. What transient conditions should be documented during vehicle processing?
   2. What kinds of activities can processing a vehicle entail?
   3. Name common areas that should be considered for latent print processing.
   4. Name common areas that should be considered for the collection of contact DNA swabs.
   5. Discuss trace evidence standard collection techniques with your trainer.
   6. How can damage to vehicle be documented? What evidence can be collected from damaged areas?
   7. What equipment would be used if a sexual assault was suspected to have occurred in the vehicle? If evidence is located, how could it be collected?
   8. How can items be documented within a vehicle?
   9. How should items in a vehicle be prioritized in terms of collection?
   10. What could be done if no keys are available for a vehicle and it is locked?
   11. If multiple items of clothing exist inside a vehicle, what should be collected?
   12. How can indicia be documented? What determines whether to collect indica or not? What about receipts?
   13. What items could be documented to demonstrate a hit-and-run scenario?

C. Practical Exercises
   1. Document a vehicle under the direction of your trainer.

D. Required Reading
   1. Crime Scene Investigation Reconstruction, Robert Ogle, Jr. pages 196-206

E. Suggested Reading
   1. Vehicular Accident Investigation and Reconstruction, Donald J. Van Kirk

END OF DOCUMENT
I. The primary purpose of this unit of instruction is to introduce the trainee to the recognition, proper handling, collection, and documentation of latent print evidence at crime scenes.

A. Objectives
   1. To develop friction ridge detail at various crime scenes using physical and chemical techniques including, as necessary, optical and forensic alternate light sources.
   2. To understand the basic characteristics of friction ridge skin and their transferred impressions.
   3. To select and apply accurate recording and documentation techniques to optimize the usefulness of latent friction ridge detail at crime scenes.
   4. To apply the appropriate method(s) for collecting and preserving latent friction ridge detail at a crime scene.

B. Study Questions
   1. Name the three basic fingerprint patterns.
   2. Can the friction ridge detail from our finger joints, palms or the soles of our feet be used for identification purposes?
   3. Name two friction ridge characteristics used for identification/individualization.
   5. Define the difference between physical and chemical processing techniques and how each category might be used at a crime scene.
   6. Explain the appropriate application of black and magnetic powder.
   7. Discuss and demonstrate the documentation requirements of observed, developed and preserved friction ridge impressions.
   8. Discuss and demonstrate the appropriate collection, packaging and transport of latent friction ridge physical evidence associated with various crime scenes.
   9. Share your general understanding of the preservation and storage requirements of latent friction ridge physical evidence for subsequent laboratory processing.
  10. Share your general understanding of the importance of obtaining known inked print standards, including deceased prints.

C. Practical Exercises
   1. Discussion of Level 1 (class characteristics: overall ridge flow and fingerprint patterns) and Level 2 characteristics (individual ridge path – bifurcations, ridge endings, dots)
   2. Using the appropriate physical development techniques, process the following items as directed:
      a. Aluminum can
      b. Glass bottle
      c. Plastic beverage bottle
      d. Mirror
      e. Vehicle exterior
   3. Discuss the areas on the interior of a vehicle you would process for latent fingerprints with your trainer.
4. Obtain a set of exemplars from a coworker and have a latent print examiner provide feedback on the quality.

D. Required Reading

E. Suggested Reading

1. NIJ: The Fingerprint Sourcebook. Chapters 4, 7, 8, 9, and 11.

END OF DOCUMENT
I. Purpose: The primary purpose of this unit of instruction is to introduce the trainee to the recognition, preservation, collection and documentation of biological evidence at crime scenes.

A. Objectives
   1. To demonstrate the ability to search for blood and other biological material at a crime scene, including the use of an ALS.
   2. To demonstrate the ability to use presumptive blood tests.
   3. To demonstrate the ability to document blood and other biological materials at a scene.
   4. To use proper collection and preservation techniques for blood and other biological evidence, including contact DNA.

B. Study Questions
   1. What structure in blood reacts with the O-tol test, resulting in a positive reaction? What are common false positive materials that react with O-tol?
   2. Why is O-tol a presumptive test? What controls are necessary to document for presumptive tests?
   3. When might you use Hemastix instead of O-tol?
   4. What is the purpose of a substrate control? Is a control necessary in all cases?
   5. You have a pool of blood at a crime scene. How would you collect a sample of that blood? How would you store it?
   6. You have a trail of blood drops leading away from the body of a deceased individual (beaten to death), down a hallway in a residence, and out the back door. You don’t count the individual droplets, but there appears to be several dozen individual drops that make up the trail. How many would you collect and why?
   7. You are examining a car seat where you believe an individual bled profusely. You observe that the upholstery fabric is stained an even, diffuse yellowish-light red color over the entire seat portion. You cut out a piece of fabric for your sample, and notice that the seat cushion is thoroughly saturated with blood – so much that it’s soaked through and is dripping onto the floorboard underneath. Why do you think the upholstery stain looked as it did?
   8. Why is it recommended that you air dry wet biological evidence? How could wet biological evidence be transported to the laboratory?
   9. It has been 1½ days since the assault took place where the victim was beaten and bleeding severely. You find a suspected assault weapon (a wooden bat) in the gutter of a street near the suspect’s residence. It has also started raining several hours earlier and you assume the bat has been immersed in water for that time. Do you think any blood will be left on the bat for DNA testing?
   10. Describe where on a vehicle you might start swabbing for latent blood when none is visible. Let’s assume that investigative information leads you to believe that the possible driver may have been bleeding.
   11. What body fluids may fluoresce with the ALS? Which ones will not?
      a. What filter works best with the ALS set to 450nm? 415nm?
   12. You have a suspected semen stain located on a car seat. Describe at least two ways you can collect the stain. Explain the pros and cons of each method.
   13. Discuss some possible sources of DNA contamination. What PPE would you use to protect evidence from contamination?
   14. Where are the best places to collect contact DNA from a car? From a firearm?
15. What biological evidence may be packaged together? When can biological evidence not be packaged together?

C. Practical Exercises

1. Collect contact DNA from a firearm.
2. Test a positive and negative control with O-tol and document in your notes.
3. Test and document the following stains with O-tol as directed:
   a. Human blood in diminishing stain size
   b. Human blood in serial dilution
   c. Animal blood
   d. Horseradish
   e. Rust
   f. Semen
   g. Perspiration
   h. Ink stain
   i. Chocolate stain
   j. Ketchup stain
4. Collect the bloodstains from the following substrates using an appropriate technique as directed:
   a. Wallboard
   b. Carpet
   c. Glass
   d. Wood
   e. Denim
   f. Metal
   g. Leather
5. Practice the following different methods of collecting bloodstains:
   a. Cutting out the stain
   b. Swabbing the stain
   c. Scraping the stain from a vertical object
6. Use an alternate light source to examine the following items as directed:
   a. Semen in diminishing stain size
   b. Perspiration stain
   c. Coffee stain
   d. Bleach
   e. Soap
   f. Blood serum
   g. Semen-free vaginal stain
   h. Neat semen stain
   i. Urine stain
   j. Beer stain
7. Discuss with your trainer the different sources of DNA.

D. Required Reading

E. **Suggested Reading:**

END OF DOCUMENT
I. The primary purpose of this unit of instruction is to introduce the trainee to the recognition, safe and proper handling, collection and documentation of firearms evidence at crime scenes.

A. Objectives
   1. To demonstrate the ability to use safe handling techniques for recovering firearms at crime scenes.
   2. To develop the ability to recognize firearms evidence.
   3. To demonstrate the ability to properly document and collect firearms evidence.

B. Study Questions
   1. What are the safe handling and unloading techniques for various firearms types (revolvers, pistols, rifles and shotguns, tube magazine)?
   2. Describe the components of a cartridge and shotshell.
   3. What factors effect the size of the hole that a bullet makes in a substrate?

C. Practical Exercises
   1. Observe a revolver containing six (6) cartridges within its cylinder. Document the make, model and serial number of the firearm, the general description, the number of cartridges, and the cartridge placement.
   2. Correctly render safe, secure and properly package the above firearm. Mark the exterior packaging appropriately.
   3. Repeat practical exercises 1 and 2 with a variety of firearms, as supplied by a firearms examiner.
   4. Disassemble several cartridges and shotshells to become familiar with the components that may be encountered at a crime scene (bullets, cartridge cases, shot pellets, slugs, various powders, shot shells, wads, shot cups, etc.). Also examine samples of fired components as supplied by a firearms examiner.

D. The following practical exercises/demonstrations need to be conducted at a firearms range or other appropriate location with a qualified firearms examiner. Range safety will be discussed by the firearms examiner prior to beginning the exercises. The firearms examiner(s) will be the designated shooter(s) for these exercises.

   1. Ejection Patterns:
      a. Use several semiautomatic weapons to demonstrate the variability in the ejection patterns from each of the weapons and variability created by the surface struck by the cartridge cases (fire on asphalt surface and grassy area if available).
      b. Demonstrate how the position of the weapon affects the ejection pattern.

   2. Trajectory Analysis:
      a. If possible, shoot firearms straight-on into the post to demonstrate penetration and the size of the hole created from each weapon. After each shot observe the damage, check each of the secondary targets and discuss bullet flight. String the holes through the series of targets to determine changes in bullet flight. Label the holes in each target so that subsequent shots can easily be distinguished.
      b. Using the same targets, shoot an angled shot along one side. Observe the furrowing and review the bullet flight.
      c. Using a drywall target, fire two 12 gauge shot shells into the drywall from a distance of about 10 yards. Observe the penetration and pellet pattern of each and any damage produced by the shot cup. Discuss the value of recovering the shot cup and the distance it traveled. Change the distance to demonstrate the spread of the pellet pattern.

   3. Powder Patterns
a. If possible, fire a shot from both a pistol and a revolver adjacent to the post to simulate a door frame situation. Demonstrate how the muzzle blast and gases from around the cylinder produce sooting on the post or adjacent material.

b. Shoot the post or a 2"x4" board with a muzzle distance of 6" and note the powder pattern. Fire a pistol, revolver and rifle in this manner.

c. Shoot a pistol, revolver, rifle and shotgun over a sheet of white paper. Observe the distribution of powder particles for each firearm.

d. Wrap a towel, blanket or pillow around a handgun and fire. Observe the sooting and powder burn on the object.

4. Glass

a. If possible, shoot the handguns and rifles into a sheet of laminated glass (label each hole with the corresponding caliber or document the location of each hole on paper).

b. Observe the size of the holes, extent of the fracture, and cupping around the hole.

c. Discuss how to determine directionality (entry and exit) from glass fractures (review radial, concentric and concoidal) and how the laminate layer can assist (point out coning effect).

d. Discuss how sequencing of shots may be determined and the limitations of this technique.

e. Fire a shot through the glass from an acute angle to demonstrate what effect that has on the shape of the hole and the associated damage.

5. Vehicle

a. If possible, fire across the hood roof or trunk of the vehicle and then examine the area for gunpowder. Take tape lifts or vacuum sweepings and examine the results of the collection technique.

b. Fire the handguns and rifles straight into the door panel. Observe the damage and determine which bullets exit into the vehicle.

c. Fire handguns and rifles through the rear quarter panel and into the trunk. Observe the damage (entry and exit holes).

d. Fire bullets along the curved areas of the vehicle and at various angles to demonstrate how the shape of the defect (bullet hole) can vary.

e. Fire various shot shells into the vehicle. Observe the penetration and shot patterns produced.

f. Shoot the tire(s) with a 357 caliber, 40 caliber or 45 caliber firearm. Observe the size of the hole in the tire with respect to the caliber of the bullet.

g. Fire a shot shell into the windshield. Observe the penetration and overall damage.

E. Suggested Reading

I. Purpose: The primary purpose of this unit of instruction is to introduce the trainee to the recognition, proper preservation, collection and documentation of impression evidence at crime scenes.

A. Objectives
   1. To understand the importance and methods of properly searching for impression evidence and then applying specialized techniques for their recovery.
   2. To understand various methods for preserving and recovering impression evidence at crime scenes and in the laboratory.
   3. To understand the importance and correct procedures for photographic documentation of impression evidence at crime scenes, including the use of various lighting techniques.

B. Study Questions
   1. Discuss the value of footwear impression evidence. Is footwear evidence class or individual evidence? How big does a footwear impression need to be before it is a print of value?
   2. Discuss the proper use of tripod, light, scale, and camera when photographing a three-dimensional impression at a crime scene.
   3. Discuss various methods of enhancing impressions through photography.
   4. Define wheel base and track width.
   5. Discuss what information should be documented from the sidewall of a tire and how that information is useful in subsequent analysis.
   6. Discuss the proper way to clean a dental stone cast.
   7. Discuss the differences between gelatin and adhesive lifting materials and the qualities of various lifting materials. Discuss the surface and substrates from which lifts should not be attempted.
   8. Discuss the proper ways to take standards for tire and footwear impressions.

C. Practical Exercises
   1. Photography
      a. Produce a series of examination-quality photographs of two-dimensional footwear prints and a series of examination-quality photographs of tire track marks to include a series of sequential photos documenting a track of at least three feet in length.
      b. Prepare several depressed prints of various depths and photograph these prints from various lighting angles and positions and compare results of different shadowing effects. Discuss the problems associated with photographing deep impressions.
      c. Prepare a mark on a transparent surface and photograph it for maximum clarity of detail.

   2. Enhancement
      a. Prepare a blood track and enhance it by using Amido black or LCV.
      b. Prepare tracks and process/enhance them with fingerprint powder

   3. Recovery
      a. Using dental stone, cast footwear impression at least two types of the following materials:
         i. Fine topsoil
ii. Sandy soil
iii. Submerged or partially submerged mud
iv. Make notes concerning your efforts and observations.

b. Using an electrostatic lifting device, attempt to lift prints of dry and wet origin from some of the following surfaces:
   i. Wood
   ii. Simulated winter clothing
   iii. Metal
   iv. Sheetrock
   v. Newspaper
   vi. Carpet
   vii. Tile
   viii. Make notes of your observations and results.

c. Using gelatin and adhesive lifting materials, make some lifts of both dry residue and wet residue marks on both porous surfaces and on non-porous surfaces.

d. Make a wet origin mark on a smooth waxed or a polished surface and allow them time to dry. Enhance these marks using fingerprint powder. Attempt to lift the prints using the following:
   i. Overlapping strips of transparent adhesive tape transferred to white card stock.
   ii. Commercial clear adhesive footprint lifters.
   iii. Clear, white and black gelatin lifting material.
   iv. Make notes on your results and observations.

e. Determine the wheel base and track width of at least three vehicles available in the parking lot.

f. Make appropriate observations and measurements of a vehicle track provided by the instructor.
g. Collect several toolmarks using Forensic-Sil (or equivalent).

D. Required Reading

3. The Science of Fingerprints, United States Department of Justice, Federal Bureau of Investigation, Revision 12-84.

END OF DOCUMENT
The primary purpose of this unit of instruction is to introduce the trainee to the recognition, proper handling, collection and documentation of trace evidence at crime scenes.

A. Objectives

1. To understand the capabilities and limitations of trace evidence analysis.
2. To demonstrate the ability to utilize the proper methods of trace evidence collection, protection and packaging.
3. To understand the necessity of collecting appropriate standards from the crime scene.
4. To understand the potential for cross-contamination of trace evidence and methods for preventing cross-contamination.

B. Study Questions

1. Describe the various types of trace evidence.
2. Discuss the advantages and disadvantages of particle picking, tape lifting and vacuuming.
3. What steps can be taken to reduce the risk of cross contamination between samples when using a particle picking technique at a crime scene? Adhesive lifting? Vacuuming?
4. What method of collection works best for glass, paint, hairs and fibers from an item of evidence?
5. Discuss why it is usually better to collect the entire item of evidence for trace analysis rather than screen that item at a crime scene. When would it be appropriate to collect trace evidence from an object at a scene?
6. Discuss the use of various lighting sources (oblique, high intensity and ALS) for visualizing trace evidence.
7. Discuss the various documentation techniques (photography, sketches and notes) that can be used at a crime scene for trace evidence.
8. Discuss glass breakage and how to determine which fractures are concentric and which are radial. Demonstrate the proper method for marking glass fragments when directionality of break needs to be determined.
9. Discuss the use of controls/standards in the laboratory. How and where would you collect a glass standard, carpet standard and paint standard? How can you package the standards to ensure that they do not contaminate other items of evidence?
10. Discuss packaging of fragile evidence for transport to the lab (headlamps, broken glass).

C. Practical Exercises

1. Screen a car seat (particle pick, tape lifts and vacuum) searching for hairs, fibers and paint fragments. Examine the results under a stereomicroscope.
2. Demonstrate the techniques of particle picking, tape lifting and vacuuming on a piece of clothing.
3. Photograph an individual's hair stuck to an object.
4. Examine a sweater with natural light, high intensity light and an alternate light source. Describe the amount of foreign material that is visible by each source.
5. Adhesive-lift your work area prior to handling a sweater. Handle (lightly shake) a sweater at this work site for approximately 30 seconds. After handling the sweater adhesive-lift the work area again. Repeat after one hour. Also, adhesive-lift your lab coat. Use separate lifts for each arm and other areas of the lab coat. Examine the lifts under a stereomicroscope. Look for fibers of the same color as the sweater. How many fibers did you find on each lift? What precautions must be taken to reduce the chance of cross contamination between items of evidence?
6. If possible, go to an automotive junkyard and document and collect the following samples: a broken head or tail light, pieces of broken glass, paint standards collected from damaged and undamaged areas and carpet standards. Package these samples for transport to the lab. At the lab reexamine the evidence. Did the packaging protect the items that were collected?

D. **Suggested Reading**

END OF DOCUMENT
I. The primary purpose of this unit of instruction is to introduce the trainee to the recognition, proper handling, collection, and documentation of bloodstain pattern evidence at crime scenes.

A. Objectives

1. To understand the history, development, and advancement of bloodstain pattern analysis.
2. To understand the purpose and function of bloodstain pattern analysis in crime scene investigations.
3. To recognize the inherent limitations of bloodstain pattern analysis.
4. To recognize the appropriate protective measures to follow in processing bloodstained crime scenes.
5. To understand the characteristics of liquid blood and blood droplets under force and upon impact.

B. Study Questions

1. What is bloodstain pattern analysis?
2. Name three pieces of information that may be obtained through bloodstain pattern analysis.
3. What is the purpose of bloodstain pattern analysis?
4. Define the following terms and explain their importance to bloodstain pattern analysis:
   a. Gravity:
   b. Surface tension:
   c. Air resistance:
   d. Viscosity:
   e. Oscillations:
5. How does the shape of an individual bloodstain change as the angle of impact becomes more acute?
6. Name the two most dangerous bloodborne diseases to which the crime scene analyst may be exposed.
7. Name four steps that can be taken to reduce or eliminate possible exposure to bloodborne pathogens.
8. What are the two main components of blood?
9. Common presumptive tests for blood (O-Tol, Hemastix) react with what portion of the red blood cells?
10. What component of the blood is useful for DNA analysis?

C. Practical Exercises

1. These practical exercises are typically performed as part of a week-long class on bloodstain pattern analysis.
2. **Objective:** To study the circular and elliptical shapes of the stains produced by drops of blood falling onto a surface at varying angles. As the angle of impact becomes more acute, the resulting stains become increasingly elongated. The reproducibility of this characteristic elongation can be demonstrated by varying the texture of the target surface.
   a. **Equipment:**
      i. Precut angle block
      ii. Clipboards (8)
      iii. White poster board (9 pieces)
iv. Sandpaper or wallpaper (9 pieces)

v. Tape measure

vi. Plumb line

vii. Pipette

viii. Blood

b. Procedure:

i. Mark the nine white poster board targets with impact angles from 10-90° in 10° increments

ii. Begin with the 90° impact angle by placing the white poster board target on the floor.

iii. Allow several drops of blood to fall straight down from the pipette onto the target surface from a height of 48 inches.

iv. Use the tape measure and plumb line to ensure accuracy.

v. Place a piece of white poster board onto a clipboard and insert into the precut 80° impact angle on the wooden block.

vi. Repeat the blood drop process above. Leave the target in the wooden block until dry. Repeat this process for the remaining impact angles.

vii. Repeat the entire procedure using wallpaper or sandpaper (to vary surface texture)

c. Once the stains have dried:

i. Measure the width and length for three stains from each target. Measurements will vary between individuals so it is important to have only one person measuring the stains.

ii. Calculate the W/L ratio

iii. Calculate the impact angle

d. Record Observations:

i. How does the texture of the target surface effect the degree of elongation of the stain?

ii. How does the surface texture of the target effect the appearance of the stain and your ability to calculate the angle of impact?

iii. What characteristics allow you to determine direction of travel?

3. **Objective**: To evaluate the correlation between the distance that a blood drop falls and the diameter of the resulting stain. Limitations present in evaluating the distance a blood drop has fallen will be illustrated.

a. Equipment:

i. White poster board

ii. Glass

iii. Newspaper, fabric or carpet

iv. Ladder

v. Tape measure

vi. Plumb line

vii. Pipette

viii. Blood

b. Procedure:

i. Allow three drops of blood to fall straight down from the pipette onto a horizontal white poster board target from heights of 3, 6, 12, 24, 36, 48, 60, 72 and 96 inches. Be sure to mark each set of drops with the corresponding height. Use the tape measure and plumb line to ensure accuracy.

ii. Repeat the procedure using a glass target surface and an absorbent target surface (newspaper, fabric, carpet)

c. Once the stains have dried:
i. Measure the diameter of each stain and calculate average stain diameter. Measurements will vary between individuals so it is important to have only one person measuring the stains.

d. Record Observations:
   i. How does the surface texture of the target effect the diameter of the stain?
   ii. How does the distance fallen effect the diameter of the stain?

4. **Objective:** To evaluate the correlation between the surface area that blood drips from and the diameter of the resulting stain. The volume of a blood drop is dependent upon the surface from which it falls.

   a. Equipment:
      i. White poster board
      ii. Various objects (knife, hammer, screwdriver, bat, etc.)
      iii. Tape measure
      iv. Plumb line
      v. Blood

   b. Procedure:
      i. Allow several drops of blood to fall from various objects onto a horizontal white poster board target from heights of 3, 12, 36 and 72 inches. Be sure to mark each set of drops with the corresponding object and height. Use the tape measure and plumb line to ensure accuracy.

   c. Once the stains have dried:
      i. Measure the diameter of each stain and calculate average stain diameter. Measurements will vary between individuals so it is important to have only one person measuring the stains.

   d. Record Observations:
      i. How does the surface area of an object on which a blood drop is formed effect the size of the resulting stain?
      ii. Is there a similarity between the stain diameters of blood dripped from a large surface area close to the target and blood dripped from a small surface area higher above the target?

D. **Suggested Reading:**

I. The primary purpose of this unit of instruction is to introduce the trainee to the recognition, safe and proper handling, collection and documentation of drug evidence at crime scenes.

A. Objectives
   1. To understand the potential safety hazards of drug evidence.
   2. To understand the proper packaging of drug evidence.
   3. To recognize potential drug evidence.

B. Study Questions
   1. What is transdermal absorption? What drugs can be absorbed transdermally?
   2. What personal protective gear should be worn when handling suspected controlled substances?
   3. How should suspected controlled substances be packaged?
   4. What is paraphernalia? Give three examples of drug paraphernalia.

C. Practical Exercises
   1. Spend time in the Drug Unit shadowing a drug analyst to become familiar with the appearance of commonly encountered controlled substances and their packaging.

D. Suggested Reading

END OF DOCUMENT
I. The primary purpose of this unit of instruction is to introduce the trainee to the recognition, proper handling, collection and documentation of entomology evidence at crime scenes.

A. Objectives
1. To understand the capabilities and limitations of forensic entomology.
2. To understand the necessity of collecting detailed climate and environmental conditions from the crime scene.

B. Study Questions
1. Why should insect activity be considered an important aspect of a homicide investigation?
2. What is the direct relationship of Arthropods to human remains?
3. What are the four basic arthropods having some direct relationship to the corpse?
4. What are some factors that may delay an invasion of arthropods on human remains?
5. What general sequence of events takes place when determining the post-mortem interval?
6. What are the general developmental stages of arthropods?
7. What are the collection and preservation procedures for the following groups of arthropods:
   a. Flying insects (Diptera, true flies)
   b. Crawling insects (Coleoptera, beetles)
   c. Burrowing insects
   d. Immature and Soft-bodied insects?
8. How are living specimens reared to the adult stage?
9. What is the proper procedure to label specimens and packaging material related to entomological evidence?

C. Practical Exercises
1. None

D. Suggestion Reading
1. Forensic Entomology-The Utility of Arthropods in Legal Investigations, Edited by Jason H. Byrd and James L. Castner

END OF DOCUMENT
I. A scene that involves the recovery of buried and/or decomposed or skeletonized human remains is no different from any other crime scene investigation. There is still a scene, a victim, a suspect, and physical evidence. The same processing techniques are used: examine, photograph, sketch, and process. The primary purpose of this unit of instruction is to introduce the trainee to the collection and documentation of human remains at crime scenes.

A. Objectives
   1. To understand the macrostructure of bone and its function as a human body component.
   2. To differentiate between bone and non-bone material.
   3. To demonstrate the ability to apply archaeological techniques in human remains recovery.
   4. To implement detailed note taking, measurement, and photographic techniques that will aid in the recovery and subsequent examination of remains.
   5. To become knowledgeable of and experienced with specific search techniques when attempting to locate scattered or subsurface burials.

B. Study Questions
   1. What type of tissue is bone? What is its purpose in the human body, and what is the anatomy of bony structures?
   2. What is the difference between a scattered remains scene and a clandestine burial?
   3. What are the similarities between archaeological methods and forensic investigations? What are the differences?
   4. Name and describe search methodologies and techniques in field investigations involving human skeletal remains (buried or surface scattered).
   5. How many bones are in the human body? How many bones are important in the identification of an individual?
   6. How are items of evidence marked at a scattered remains scene? How are items of evidence marked at a clandestine burial?
   7. How should a buried body or scattered skeletal remains case be documented?
   8. How should remains be packaged for transport?

C. Practical Exercises
   1. Obtain human and non-human bone reference samples.
   2. Observe the physical structure of a long bone. Identify compact bone, cancellous bone, and the marrow cavity.
   3. Diagram a cross-section of bone, labeling all structures and their function.
   4. Note the width of the compact bone within the shaft of a long bone provided. Compare this with the relative width of several animal bones (bird, small and large mammals, ungulates) and note the distinct difference in width.
   5. Observe several samples given to you by your coach or trainer. Determine which materials are bone, and which materials are not bone.

D. Suggested Reading
   1. Practical Homicide Investigation, Third Edition, author Vernon J. Geberth, Chapter 10
I. Expert witnesses must assure the judge or jury that their testimony is sound and truthful. The expert is testifying to their field activities. The expert must testify to the forensic significance of the evidence, regardless of whether this helps the prosecution or defense. The expert must be highly knowledgeable, organized, unflappable, and ethical.

A. Objectives

1. To develop the skill to present expert testimony that is accurate, knowledgeable, clear, concise, believable, and unbiased.
   a. Knowledgeable — Show that you are up to date, have command of the subject matter in your field, and are knowledgeable about the California laws relevant to the case (Kelly/Frye). Know how to use such things as demonstrative evidence (an item not from the crime scene that is used to illustrate a point).
   b. Organized — Be able to easily reference and locate key pieces of evidence. Reports should clearly document the test results.
   c. Unflappable — Do not appear combative or annoyed during questioning, especially during cross-examination.
   d. Ethical — Know the ethical standards of conduct. Display objectivity, not advocacy for either side.

2. To demonstrate proper courtroom demeanor and attire by clothing choices, body language and mannerisms, and both verbal and non-verbal expression.

3. To effectively prepare for courtroom testimony by pretrial communications and case review.

4. To understand the court system, courtroom procedures, and courtroom etiquette.

B. Study Questions

1. Describe the order of events that occurs in a courtroom when you are offering expert testimony. Start your description from the time you are called into the courtroom and end when you exit the courtroom.

2. Describe the order of legal events that occur to a defendant from the arrest through sentencing.

3. Discuss the importance of the content of your testimony vs. the manner in which the testimony is delivered. Which is more important and why?

4. Describe how you would dress for court to present a professional image. Include descriptions of clothing you would wear, as well as your grooming.

5. Discuss some behaviors or mannerisms you feel would be distracting from your testimony. What habits do you specifically have that you want to work on minimizing or eliminating?

6. What items in the case file are discoverable? Which items are not?

7. The defense attorney on a case calls you on the phone and asks you for a copy of all reports and notes pertaining to that case. What do you do?

8. You answer a question with, “I don’t know” but later during your testimony you remember the answer to that question. What would you do?

9. What is the difference between an “ordinary witness” and an “expert witness”?

10. What are the criteria for the admissibility of scientific evidence in the state of California? What is the name of the case that resulted in these criteria?

11. Describe what pretrial preparation you would do for upcoming testimony regarding a crime scene processing.

C. Practical Exercises
1. If possible, observe the testimony of a crime scene responder. Discuss what you learned from observing the process (both about the courtroom process and the delivery of the testimony).

D. Required Reading

E. Suggested Reading

1. Courtroom Testimony CCI Class Binder

END OF DOCUMENT
I. The goal of the training program is to provide uniform coordination and quality training in all aspects of Crime Scene Processing to laboratory personnel. The work performed by the trainee is intended to be part of a formal training program that will establish a certain minimum standard of professional competency.

A. Introduction

1. Crime Scene processing is typically a secondary job function for staff of the Forensic Service Division. This training program is designed to train the analyst on the principles of Crime Scene Processing. The trainee must demonstrate knowledge of the required objectives by successfully completing written tests and practical exercises throughout the training program. The trainee must also communicate an understanding of the objectives and underlying principles.

2. Training is multi-faceted and ever changing. The sections of this manual are outlined to allow for changes during the training period (eg., new processing techniques that become available). The sequence in which the modules are presented should not necessarily be considered as a mandatory order of instruction.

   a. The minimum qualification for an analyst to perform crime scene casework is a high school diploma (or equivalent) and successful completion of the appropriate training modules.

3. The trainee will respond to crime scenes while also performing their routine duties in their primary assignment.

B. Coordination and Overview of the Program

1. The Training Program will be coordinated by the Crime Scene Supervisor.

   a. The Supervisor will be responsible for the overall training, but may choose to delegate certain duties or blocks of instruction to other qualified analysts.

2. The length of the training period may vary and will be left to the determination of the unit Supervisor. Certain individuals may require less time than others, depending on experience, education, or learning ability. The expected time to complete the full program is approximately one year for a trainee assigned to the Unit full-time. The trainee will be provided a timeline for completion of assigned modules.

3. The training will consist of thorough instruction (e.g., mentor sessions, presentations, practical exercises, reading assignments), hands on training, and application of lessons at crime scenes.

4. Trainees will begin as tertiary crime scene responders. Their primary duties are to learn from crime scene responders as well as perform duties that do not require testing (e.g. Measurements, sketches, and labeling packaging). They may be authorized to perform crime scene duties based on training received in their primary assignment (e.g. swabbing, latent print processing, etc.).

5. Transition from tertiary to secondary crime scene responders and secondary to primary crime scene responders require successful completion of a competency test.

   a. The Supervisor may assign a non-primary secondary to process crime scenes and write reports under the direction of an experienced primary prior to completion of all modules.

6. The Supervisor is responsible for ensuring that the analyst's Training Records are completed in a timely fashion as training progresses. The appropriate spaces on the training checklists and forms will be initialed, dated, and completed for each area assigned by the Supervisor and/or any other personnel who assisted in the training.

7. The various quizzes and activities throughout each module will be assessed on a Satisfactory/Unsatisfactory basis.

8. The trainer is expected to communicate with the trainee offering feedback and guidance throughout the training program.

9. A mock court exercise will be conducted as part of the final competency test for primary crime scene responders.

C. Orientation

1. Before beginning the training program, the new employee will be oriented to expectations, timelines, and schedule of training for the trainee.
2. The trainee will be introduced to PowerDMS and assigned to read the Crime Scene Technical and Training Manuals.

3. The trainee will be provided general knowledge of forensic science and training on ethics as related to Crime Scenes.

D. Expectations of Trainee

1. The trainee is expected to keep a notebook/binder of information compiled during the training program. Copies of written examinations, practical exercises, presentations, or other items prepared during training should be maintained in the notebook/binder. These items may be maintained electronically.

2. Documentation of the completion of the suggested reading for each module should be maintained (e.g., on a reading list).

3. As designated by the unit Supervisor, the trainee may assist with casework (to the extent of which they are qualified) during the training, only under the direct supervision of a qualified responder.

4. Study time for the trainee is not restricted to on-duty hours.

5. Trainees are expected to communicate any concerns about their training to the Supervisor.

E. Progression and Guidelines for Competency

1. The crime scene unit has three categories of responders (tertiary, secondary, and primary). Competency testing is required to become a secondary and primary crime scene responder.

   a. Successful completion of both the test of knowledge and the test of sufficient unknowns (mock crime scene) requires a score of 80% along with a written report.

      i. The test of knowledge and quizzes may have multiple choice, true/false, fill-in-the-blank, and/or essay type questions.

      ii. Failure of any portion of a module will result in remedial training prior to retesting. Failure of a retest could result in the trainee's elimination from the training program.

   b. The samples used for the practical portion of the crime scene competencies may be created internally, at the direction of the unit Supervisor.

   c. The competencies will encompass only the duties expected from a secondary or primary responder.

F. Modules

1. It is expected that the trainee will successfully complete the core training modules in order to successfully complete the training program.

   a. Completion of some of the specialized training modules (Bloodstain Pattern Analysis, Body Recovery) will be dependent upon the operational needs of the Division; therefore, not all trainees will be trained in all areas prior to a competency test.

2. The Objectives outline the purpose of each study segment.

3. The Study/Discussion Questions have a number of purposes:

   a. To assist reading comprehension by providing a focus on certain concepts prior to completing Required Readings,

   b. To evaluate understanding of relevant concepts after completing Required Readings

   c. To promote active discussions between the trainer and trainee using the questions as a starting point.

      i. The answers to the questions may be written, verbally discussed, or a combination of both.

   d. The Practical Exercises are designed to provide the trainee first-hand experience with the main concepts of each study segment.

      i. Many of these practical exercises will be encompassed by training classes such as Shooting Incident Reconstruction or Bloodstain Pattern Analysis.

      ii. Other practical exercises may not actually be performed due to a variety of administrative concerns, but the trainee will describe how he or she would perform the exercise.

4. The Suggested Readings list the reference material that should be read to successfully complete the study segment. The reading assignments are cumulative; comprehension of prior readings and are required to successfully complete Study/Discussion Exercises of subsequent study segments. Study/Discussion Exercises should be reviewed prior to completing Required Readings.

G. Training Documentation

1. After successful completion of modules, the crime scene supervisor will complete the appropriate forms.
2. Completed and in progress authorization forms (CSF.13) will be maintained by the crime scene supervisor or designee.

3. The effectiveness of initial training will be monitored by the Supervisor in one or more of the following ways:
   a. Providing feedback to the trainee after completion of initial training modules and competencies.
   b. Soliciting feedback from the trainee regarding the initial training modules, including discussion about the practical exercises, required readings, and study questions.
   c. Performing technical or administrative review of initial casework produced by trainee.
   d. Providing annual performance evaluations.

H. Transition from secondary to primary

1. Upon completion of the competency, and having been granted authorization, the responder will have attained the necessary knowledge, skills and abilities to independently perform crime scene processing. Regardless of how well a new examiner handles their assignments during the transition, there follows a period of adjustment. The unit Supervisor should monitor the new primary's casework for a period of time following authorization. In addition, the Supervisor should accompany the newly qualified primary to crime scenes to offer guidance and mentor the new primary.

I. Assessment/Training of Experienced Personnel

1. The responsibility of assessing the degree of qualifications of newly hired experienced personnel who have successfully completed a qualified training program in crime scene processing shall lie with the unit Supervisor with approval from the Manager and/or Chief.

2. Some content or sections of this training program may be skipped for a previously trained analyst who has demonstrated to the Supervisor a comprehensive knowledge of the subject matter with the approval of the Manager and/or Chief.
   a. In order to substitute for the entirety of the training specified in this manual, the analyst must provide documentation of their formal and informal training records which cover all facets of crime scene processing along with a crime scene log.

3. Methods of verifying the completion of prior training could include, but is not limited to, reviewing the individual's job application, statement of qualifications, transcripts or prior training records. A series of practical, written, and/or oral technical exams could also be administered.

4. Newly hired personnel shall not be authorized to perform casework by the Chief, Manager and/or Supervisor until the successful completion of a competency test. The Competency will consist of a practical and written exam, and will include the issuing of a report in LIMS.

5. The unit Supervisor will monitor the new employee's casework for a period of time following authorization. In addition, the Supervisor should accompany the newly qualified primary to crime scenes to offer guidance and mentor the new primary.

J. Continuing Education

1. All analysts should participate in continuing education to broaden and/or maintain their skills and expertise in the crime scene processing discipline. Training received will be documented as outlined in QA.12. Internal training will be offered by the Crime Scene Supervisor. External training courses or programs including, but not limited to, Webinars and/or classes offered by DOJ California Criminalistics Institute, AAFS, CAC, and IAI conferences should be attended to supplement training assignments and exercises contained in this manual. The effectiveness of on-going training will be monitored and evaluated by the Supervisor in one or more of the following ways:
   a. Requiring a teach back from the analyst attending the training (or feedback regarding the training) during a unit meeting.
   b. Evaluating yearly proficiency test results.
   c. 100% Tech and Admin review of casework.
   d. Court testimony monitoring.
   e. Rotational presentations of various topics to the unit by staff.
   f. Providing annual performance evaluations.

END OF DOCUMENT
The Leica RTC360 and BLK360 are laser-scanning systems designed to record three-dimensional layouts of crime scenes.

A. **Theory:** Leica laser scanners use a time-of-flight laser range finder to record highly accurate point measurements to object surfaces within the scanning field. The scanners can also take digital images of the scene. Following the scanning process, the measurement data and digital images (if taken) are processed using specialized software to create a digital model of the crime scene in three dimensions.

**Purpose:** The scanner is a tool intended to supplement more traditional methods of crime scene documentation, including note-taking, sketching, and photography. Scanned areas do not need to be manually measured or fully sketched; however, the scanner is not intended to replace other means of documentation, including photography. High-quality photographs are still required of the scene. Additional manual measurements and photography may be required for special types of evidence (e.g., blood spatter) where access by the scanner is limited.

B. **When to use:**
1. At the request of a client agency.
2. To help expedite the measurement documentation process, especially that of a large scene or a scene with numerous items of evidence.
3. If needed, to provide supplemental measurement documentation for areas of the scene already documented by other means (e.g., another agency using a Total Station).

C. **When not to use:**
1. When the scanner cannot be placed in a stable area or on a stable platform.
2. In adverse weather conditions. **Note:** The RTC360 can be used in light rain conditions; however, the BLK 360 cannot.
3. To create Total Station data for another agency. Scanner data is incompatible with Total Station software, and the agency must have software compatible with point clouds to be able to work with scanner data.
4. As the only documentation for blood stain patterns. The scanners do not record measurements or images with enough detail for blood stain pattern interpretation. The scanners may be used for supplemental measurements of blood stain patterns.

D. **BLK360 vs. RTC360 Advantages and Disadvantages:**
1. In general, the RTC360 should be used for all scanning. The BLK360 may be used as a backup.
2. The RTC360 has higher resolution and a longer effective range than the BLK360.
3. The RTC360 has a smaller minimal scanning distance than the BLK360.
4. The BLK360 cannot record measurement data from most black surfaces; the RTC360 does not have this limitation.
5. Both scanners cannot record measurement data from highly reflective surfaces.

E. **RTC360 Recommended Settings and Operating Instructions**
1. To prepare for scanning:
   a. Plan the location of the scan perspectives. The scanner must have line-of-sight to the objects intended to be scanned.
   b. Setup the tripod. Ensure the legs are locked prior to attaching the RTC360. Mount the unit on the tripod or floor bracket.
c. Insert two batteries and turn the RTC360 on.
   i. One battery at a time may be hot-swapped while the system is on.
   ii. Two batteries must be inserted to scan.

2. When the RTC360 is turned on it performs an internal system calibration check.
   a. If the calibration check fails, the status light will be red. Hold down the power button to shut it down. Restart the scanner.
   b. If the calibration check fails a second time, the unit is not to be used and must be serviced.

3. The following settings are recommended for most crime scenes:
   a. Resolution: **High**
   b. HDR images: **On**
   c. Double Scan: **Off** (may be turned on if many people are walking through the scene. Increases scan time by 2 minutes.)
   d. Visual Inertial System (VIS): **On**

4. To scan:
   a. Press the red play button.
      i. The remaining time will be displayed on the screen. Approximately 2:30 minutes for a high-resolution scan with images.
      ii. The status LED will be yellow while scanning.
      iii. The status LED will be green when the scanning is complete and the RTC360 is ready for the next scan.
   b. To collect additional scans from a scene
      i. **Do not turn the scanner off.** The VIS system will track the locations of the scans and link the scan locations together. The scanner must be on between scan locations for the VIS system to work.
      ii. Pick up the tripod and place it at the new scan location. The RTC360 may be left attached to the scanner or removed while the tripod is relocated.
      iii. The status light will flash green while the RTC360 is being moved and while the auto-leveling is taking place.
      iv. The status light will be solid green when the RTC360 is ready to scan.
   c. Multiple scans are required for trajectory rods and to remove voids. Multiple scans are always recommended for any scene.
   d. The Twin-Target pole (length standard) should be set-up and included in at least one scan per scene.

F. **BLK 360 Recommended Settings and Operating Instruction**

1. To prepare for scanning:
   a. Plan the location of the scan perspectives to facilitate scan stitching (each scan should be line-of-sight to another scan).
   b. Mount the unit on a camera tripod with the tripod adapter or use the floor base.
   c. Insert a battery and turn the unit on.
   d. When the LED ring (surrounding base) is solid green, the scanner is ready to use.

2. To scan:
   a. Press the button.
   b. The LED ring will flash yellow while it is scanning and taking photos.
   c. When the LED ring is green, the scan is complete and the BLK360 is ready to scan again (approximately 4 minutes).
   d. Multiple scans are required for trajectory rods and to remove voids. Multiple scans are always recommended for any scene.
e. The Twin-Target pole (length standard) should be set-up and included in at least one scan per scene.

G. **Post-scene scanner activities - to be conducted by qualified personnel:**

1. The scan data will be downloaded and stored at the laboratory.
2. The scan data may be processed to yield TruViews, which are views of the scene from the scanner viewed through a web browser.
3. The TruViews can be burned to an optical disc and given to investigators.
4. Additional processing (including distance measurements) of the scan data may be completed as necessary.

II. **Training**

A. Staff will be provided hands-on training in the theory, operation, and use of the laser scanners prior to authorization. Crime Scene competency testing will cover scanner use.

END OF DOCUMENT
I. Policy: Non-conforming work is an undesirable incident or problem encountered in casework, proficiency testing, testimony or the quality assurance program. When non-conforming work is encountered in the Crime Scene Unit, action is taken to address the non-conformity.

The level of corrective action taken for any non-conformity is dependent on the type of incident or problem and its severity. In general, the greater the severity and/or its substantive nature, the higher the level of corrective action taken. The appropriate corrective action taken is based on the type of non-conformity, the magnitude/scope of the problem, and/or whether it's a single event or repetitive. Types of non-conforming work and their corresponding level of corrective action are described below.

A. Corrective Actions (Most Significant): Quality system non-conformities are discrepancies or incidents that raise immediate concern regarding the overall quality of the Unit's work product or the competency of an analyst. These non-conformities rise to the level of significant concern for the quality system or a systemic problem within the Unit.

1. Quality system non-conformities include but are not limited to:
   a. Erroneous or falsified tests, results, conclusions, records or testimony
   b. Improper or deliberate misuse of reagents, methods, equipment or evidence
   c. Audit findings
   d. Unsuccessful proficiency test
   e. Repeated Level 2 errors

2. A significant quality system non-conformity requires documentation of the corrective action per Division policy and procedure. See FSD.15, QA.18, FSDF.06, FSD.44 for more information about the evaluation of significance, required elements of a corrective action, documentation and retention of corrective action records.

B. Level 2 Non-Conformity (Somewhat Significant): These discrepancies or incidents are not serious enough to cause immediate concern for the quality system or the Unit's overall work product, but do have an isolated affect on the work product, tend to be individual events, and are addressed on a case-by-case basis. These non-conformities are typically detected prior to the release of results and conclusions, and have the potential to be re-mediated.

1. Level 2 incidents include but are not limited to:
   a. Improper use of controls, reagents, methods, or equipment when it is demonstrated their use did not impact the quality of work or validity of the result:
      i. use of expired reagents
      ii. not using a control
      iii. using equipment that has not been properly checked or calibrated
   b. Procedure not being followed when it is demonstrated that its use did not impact the quality of work or validity of the result
   c. Improper conclusions or lack of documentation of conclusions
   d. Repeated Level 1 errors

2. Documentation of a Level 2 non-conformity will be maintained within the unit and will be evaluated by the Supervisor. The documentation should include, as applicable:
   a. An explanation of the error or non-conformity. What is the problem?
   b. An evaluation of the impact (if any) on casework, equipment, etc. How significant is the problem?
c. An explanation of how the error on non-conformity occurred. Why did it happen?
d. An explanation of the action taken to correct the error or non-conformity. What was done to correct the problem?
e. A summary of any monitoring or follow-up. Was the correction effective?

C. Level 1 (Least Significant): Discrepancies or incidents that do not effect the significance of a conclusion, a reported test result, or impact on the quality system, are unlikely to recur, are not systemic, and do not affect the fundamental reliability of the work product.

1. Examples of a Level 1 Non-Conformity include, but are not limited to:
   a. transcription errors: switching the month/day when documenting the lot # of a reagent, wrong direction of the north arrow noted during review
   b. grammatical or typographical errors: spelling or grammar mistakes in reports or notes, wrong agency case number or requester in LIMS, etc.
   c. omission errors: omitting relevant information (e.g. "not to scale" on sketches)
   d. When brought to the analyst's attention, this type of non-conformity is typically corrected immediately by the analyst. A record of the correction is captured when the analyst initials and/or dates the correction as outlined in Case Record Division Policy FSD.42 and Test Reports Policy, FSD.43.
I. POLICY  
Shooting incident reconstructions are dynamic investigations that incorporate several different examinations into one comprehensive opinion. The following examinations are only some of the tests performed.

A. Examination of bullet holes

1. Examination of holes in garments. All holes in garments or in objects should be documented with photographs, notes, or sketches.
   a. Holes in clothing can be microscopically examined for evidence of firearm discharge such as:
      i. The presence of smoke and soot
      ii. Bullet wipe
      iii. Burning and tearing of fibers due to muzzle blast
      iv. Deformation of synthetic fibers due to the passage of a bullet
      v. The presence of blood and tissue from a bullet wound
      vi. Fragments from a bullet
      vii. Smokeless powder particles

2. Examination of holes in objects
   a. Perforating holes
      i. Round holes can be made by a bullet passing through an object in a flight path orthogonal to the surface.
      ii. Irregular holes can be made by a bullet fragment, a destabilized bullet passing through the object, or from a bullet striking an object at an angle.
      iii. Examine the hole for material possibly transferred from the bullet surface, such as lubricants, ricochet-acquired transfers, body fluid residue, and lead or copper transfers.
      iv. Examine the hole to determine if there was fresh removal of paint, wood, masonry, or plaster fragments.
      v. On metal or wood surfaces, look for corrosion or signs of weathering (e.g. discoloration) around the suspected bullet impact that might indicate the damage did not occur recently.
      vi. Hackle marks and cratering of glass can indicate the direction of bullet travel.
      vii. If in doubt that a suspected impact site was struck by a bullet, sample the margins of ricochet or hole with a GSR collection disk.
      viii. Chemically test surfaces for lead, copper, and nitrites, if needed (see below).
   b. Non-perforating impact sites
      i. Examine the ricochet sites as you would a penetrating hole.
      ii. On metal or wood surfaces, look for corrosion or signs of weathering (e.g. discoloration) around the suspected bullet impact that might indicate the damage did not occur recently.
      iii. Examine the impact site for visible lead or copper transfers left by the passage of a bullet.
      iv. Examine painted surfaces for pinch points and fracture lines that can indicate the direction of travel of the bullet.
v. If in doubt that a suspected impact site was struck by a bullet, sample the margins of ricochet or hole with a GSR collection disk.
vi. Chemically test surfaces for lead, copper, and nitrites, if needed (see below).

3. Further chemical testing, including the Sodium Rhodizonate test for lead, Modified Griess test for nitrites, or Dithiooximide (DTO) test for copper, can be done to identify items suspected of being related to the discharge of a gun.
   a. The absence of residues commonly associated with firearms discharge around a hole should not necessarily lead one to exclude the hole as being caused by the passage of a bullet. An intervening object may bear the evidence of the passage of the bullet leaving only the hole or impact site.
   b. Lead check swabs
      i. Squeeze and crush points marked "A" and "B" located on the barrel of the swab.
      ii. Swab the surface and then squeeze the liquid out from the swab. If the tip turns pink or red, lead is presumptively present.
      iii. A known positive control is included in the kit. Document the results of the positive/negative controls and all areas swabbed in the case notes.
   c. Sodium Rhodizonate
      i. Transfer a small amount of the surface to a swab or piece of filter paper.
      ii. Apply the Sodium Rhodizonate to the sample. A pink to red color indicates lead is present.
      iii. Apply 5% HCl to the sample. The pink to red color changing to a purple/blue color confirms lead is present.
      iv. Document the results of the positive/negative controls and all areas swabbed in the case notes.
   d. DTO
      i. Moisten a suitably sized piece of filter paper with 2:5 ammonium hydroxide solution from a small spray bottle (allow adequate ventilation).
      ii. Press the filter paper against the suspected bullet hole and adjacent areas, maintaining firm contact for at least 30 seconds. Do not let the paper move or slide across the areas being tested. If possible, mark the back of the paper to indicate the margins of the hole being tested for orientation purposes later.
      iii. Invert the filter paper and visually inspect for any deposits that may be confused for a positive DTO reaction (greenish-gray color), such as dirt or grime. Photography is highly recommended to record these deposits before applying the DTO reagent.
         1. If testing at the scene is not necessary, the filter paper may be preserved at this point for transport and later testing at the laboratory. If copper residues have been transferred to the paper, they will remain viable for testing with DTO indefinitely.
      iv. Verify the 0.2%-alcohol DTO reagent as working with a known copper transfer or deposit on one of the corners of the filter paper (or on a separate piece of filter paper)
      v. Lightly spray the filter paper with the DTO reagent. A dark greenish-gray ring corresponding to the margin of the hole constitutes a positive test for copper-containing bullet wipe. This chemical complex is typically stable over long periods of time, but color photography at or near the time of testing is highly recommended

B. Determination of smokeless powder.
   1. Smokeless powder comes in several forms and compositions.
      a. The primary compositions of smokeless powder available for small arms are single base and double base.
         i. Single base powder is composed primarily of nitrocellulose.
         ii. Double base powder is composed of nitrocellulose and nitroglycerine.
      b. Smokeless powder particles have several shapes.
         i. Ball or flattened ball, which is sometimes referred to as spherical.
         ii. Flake.
iii. Cylindrical, which may have a perforation in the center.
iv. Disk, which may or may not be perforated.
v. Other types, like lamel, in the shape of flattened diamonds.

c. Smokeless powder particles usually appear black or charcoal gray in color. This is due to the graphite coating applied to the grains. The uncoated smokeless powder color is usually green to grey.

2. Examination of garments or objects for the presence of smokeless powder
   a. Examine the garment or object for the unburned or partially burned smokeless powder.
   b. A stereo microscope can be used to locate and identify smaller particles.
   c. Care should be taken to not dislodge or move particles while examining the garments or objects.

C. Bullet path determinations.

   1. Bullet path determinations can range from simple to complex, depending on the objects hit. The following procedure may be used for simple bullet path determinations using probes on objects where either two objects were struck along the same path or a single thick object was struck.
      a. Examine the hole as described above.
      b. Document the hole, its dimensions, and its location.
      c. Examine the interior of the hole as deep as possible to determine if the bullet is still inside the object.
      d. Select a probe approximately the size of the hole or slightly smaller. Insert the probe into the hole so that the hole is not damaged.
         i. If the hole is significantly larger than the probe or one part of the hole is blown out, use a probe cone to help guide the probe.
      e. If the probe is placed correctly, it should stay in place by itself with no assistance
      f. Document the position of the probe with 3D scans, sketches, notes, and photographs.
         i. Typical photographs include those from the front, the side, the top, or the bottom. Ensure the lens is in the same orthogonal plane as the trajectory rod to reduce perspective distortion. This may be accomplished by hanging a plumb bob so that the string contacts the probe. Position the camera at the same level as the probe and plumb line intersection and make sure that the camera lens is orthogonal to the probe.
         ii. If 3D scans are taken with trajectory rods in place, manual trajectory rod measurements do not need to be taken.
      g. Measure the vertical angle of the probe with an inclinometer.
      h. Measure the azimuth angle of the probe using a protractor and plumb line.
         i. Place the protractor horizontally against the surface bearing the hole at the intersection of the hole and probe. Ensure the protractor is parallel to the ground. The center of the protractor should be at the probe.
         ii. Hang a plumb bob so that the string touches the probe and the protractor. The azimuth angle is where the plumb line touches the protractor. Azimuth angles are typically measured from an imaginary line that is orthogonal to the impact (≤ 90 degrees)
         iii. When measuring, make sure the center point of the protractor and the plumb line are on the same side of the probe.
         i. Record the measurements in your notes. Two sketches, a side view and a top view, should be used to aid in documenting the measurements.
         j. Remember to use the same reference points when recording the measurements. Either use the object hit as the reference or use the perspective of the shooter.

D. Ejection pattern determinations.

   1. Cartridge case ejection patterns can be used to determine the approximate location of a shooter at the time a firearm was fired.
   2. Ejection of cartridge cases from a firearm involves a large number of variables that cannot all be accounted for or determined. Ejections patterns are estimates of a shooter's location at best. Some of the variables to consider are:
3. Performing a firearms ejection pattern test requires the use of the Sheriff's Office Range. When conducting an ejection pattern test, the following steps should be followed:
   a. Choose a location that is similar to the surface in question. This may not always be possible.
   b. Pick a landmark to use as a reference point and mark it as necessary.
   c. This reference point will be used to take measurements from depending on which way the firearm ejects cartridge cases. Firearms may eject in any direction.
   d. Ten cartridges similar to the evidence ammunition should be used for this test.
      i. Consider firing ammunition submitted with the firearm, particularly if it is identical to the questioned components in the case.
   e. The shooter will load the firearm and position the weapon in a horizontal position directly over the reference point in alignment with the target. The ejection port of the weapon should be perpendicular to the target.
   f. Hold the weapon at the desired height and fire the test rounds. After each round is fired, the observer should mark the location where the expended cartridge case comes to rest. Label each marker with the number of the test fire.
      i. It may also be necessary to change the orientation of the firearm to determine ejection patterns when these facts are known or suspected.
      ii. Multiple tests can be performed with the gun held at different orientations to create a range of possibilities for the firearm.
      iii. A tripod or other device may be used to maintain a consistent shooting position between shots.
      iv. Plastic shower curtain rings or cones are convenient markers for the cartridge cases.
   g. Measure the location of each point where the expended case came to resting point. See the diagram below for an example.
   h. The points may be plotted in a diagram. Indicate in your diagram:
      i. The location of the ejection port above the reference point.
      ii. The direction of fire in alignment with the target and reference point.
      iii. The height and orientation of the weapon being fired.
   i. The horizontal cartridge case ejection angle can be calculated from the measurements or measured directly from a scale diagram.
   j. The information may also be entered into a spreadsheet to make a diagram and to calculate the ejection angles.

4. Report the following information in the conclusions:
   a. The minimum and maximum distance the casings were ejected from the weapon.
   b. The direction the casings were ejected.
   c. The range of cartridge case ejection angles.

5. The height of the firearm and orientation how it was held when it fired.

Example:
Ejection pattern from a Smith & Wesson model 5906 pistol S/N: TDU0104 firing issued duty ammunition (Winchester 9x19mm 127gr +P+ SXT) at a height of 58" with the firearm held in an upright two handed hold. Surface was grass. Maximum height that an ejected cartridge reached was 96". Gun is at 0, 0 position on chart. Numbers are in feet.

Raw data for shots (feet):

Negative numbers refer to distance cartridge casing ejected behind gun. Angles refer to angle to the right and back from the gun in degrees.

E. Reagent Preparation

1. Dithiooximide (DTO)
   a. Add 0.2 g DTO to 100 mL of ethanol.
   b. Mix well and store in a tightly sealed container.

2. 2:5 Ammonium Hydroxide
   a. Dilute 40 mL of NH₄OH to a total volume of 100 mL with deionized H₂O.
   b. Mix well and store in a tightly sealed container.

CHAPTER ONE:
Crime Scene Photography

DESCRIPTION:
This chapter is intended to introduce the principal concepts of crime scene photography to the law enforcement student. Areas of concentration covered will include the primary objectives of crime scene photography, the desired photographic perspectives necessary to effectively document the scene of a crime or items of physical evidence, and the proper photographic compositions necessary in scene and evidence documentation.

GOAL:
Given a simulated crime scene containing various items of evidence, the student will make properly composed, sharply focused, and properly exposed photographs that could be used as exhibits in a court of law.

PERFORMANCE OBJECTIVES:
1. Identify the primary objective of crime scene photography and the documentation needed to ensure the admissibility of photographic evidence
2. List the proper perspectives and compositions necessary during crime scene photography

Chapter Introduction

One of the single best methods of crime scene and evidence documentation is through photography. Photography taken from crime scenes is commonly used in court proceedings, for analysis, and for later reconstruction. This type of evidence memorializes the scene as it was when the incident occurred, and provides a graphical illustration to the Judges and Jurors who will ultimately decide the fate of an accused.

Main Objectives of Crime Scene Photography

The ultimate objectives of crime scene photography is its intended eventual use as evidence in a criminal proceeding, for analysis, or to aid in the re-construction of a
particular crime or law enforcement related event. The value of proper and professional crime scene and evidence photography cannot be overemphasized. Without the necessary documentation and authentication, the best crime scene and evidence photographs can be rendered inadmissible by the shrewd and articulate ability of a veteran defense attorney.

Photographs as Evidence

For a photograph to become evidence it must meet certain criteria. The following will specify the necessary criteria needed to allow for a photograph to be used as evidence:

**Relevant** - the intended photograph must be relevant to the issue being contested. Irrelevant and demonstrative photographs of a crime scene, evidence, or injuries may be found to be inadmissible due to their potential ability to prejudice the jury with respect to the state, the government, the defendant or the victim.

**Accurate** - the intended photograph must be a “Fair and Accurate” representation of the scene. Accuracy may relate directly to the exposure as well as perspective and distance relationships. It is easy to distort the accuracy of a scene through the use of an improper lens or composition. Wide angle and telephoto lenses can be integrated but should not be exclusively used during crime scene photography. A normal perspective lens, 50mm or 50mm equivalent (based on digital sensor size, commonly 1.5x or 1.6x crop factor), should be used for the majority of the crime scene photography.

**Authentic** - the photographs of the scene must be authentic. In order for the photographs and images to be admissible the photographer or an individual at the scene when the photographs were taken must be able to testify that they do accurately represent the scene as it was on the date in question, and that nothing was added to, taken away from, moved or removed from the scene before the photographs were taken.

**PHOTOGRAPHS INTENDED FOR ANALYSIS**

There are countless examples of types of evidence that are best collected through use of photography. Photography may in fact at times be the only method of collection of certain types of evidence because many items commonly encountered are too fragile or difficult to physically collect without the risk of damage or destruction. Examples of these items may include a fragile fingerprint on a difficult surface, a shoe or tire track in soft sand, an injury on human skin, tool impression evidence left at the scene of a crime, or perhaps skid marks and road damage left on the pavement at the scene of a vehicular homicide.

Many types of evidence become very valuable following an analysis that results in compelling testimony from an expert witness which suggests the guilt of the accused.

Photographs of evidence intended for analysis are close-up/evidence grade images. These types of images will be discussed further in performance objective 2.
PHOTOGRAPHS TO AID IN RECONSTRUCTION-

Photographs from complex and violent crime scenes are often used to help theorize and reconstruct the events of an incident. When done correctly, crime scene photography can afford valuable insight to analysts and crime scene reconstructions as to the events leading up to and following an incident.

PHOTO IDENTIFIER (THE FIRST SHOT)-

Prior to beginning photography of a scene, or any evidence, the photographer should prepare an identifier that lists certain relevant information about the case. The identifier can be a pre-printed departmental document, a portion of the Field Services Information Form containing the pertinent case information, or just a plain white piece of paper with a fat edged black magic marker writing on it. The media in which the information is written is not as important as the information itself. When working an investigation with multiple locations or secondary scenes, a new identifier should be completed reflecting the change in location prior to beginning photography. The requisite information that should be included:

1. Case number & Agency Information
2. Photographer/Investigator name
3. Date that photographs were taken

When shooting with a digital camera, most of the camera settings can be acquired post capture from the cameras metadata. An exception to this is when any filters or alternative light sources are integrated. When using a technique or device during capture that will not be recorded in the camera’s metadata, that information should be reflected in your field notes for later reference.

HANDLING OF CRIME SCENE PHOTOGRAPHS-

Although most of the photographs taken at a crime scene are not considered to be “evidence” by the Forensic Services Division, their handling by the crime scene responder after the scene is still very important. Whether or not the images are ever used in court, photographs become part of the investigation, and could be potentially valuable for the prosecution or defense during a criminal proceeding. Like any other evidence collected during a criminal investigation, photographs must be handled properly in order for them to maintain their value and integrity.

Refer to policy FSD.42.01, “Diagrams, Photographs & Digital Images” for specific information on handling, storage and retention of crime scene photographs.
The Proper Perspectives and Compositions Necessary during Crime Scene Photography

In order for the complete and accurate story of a crime to be told, photographs of the scene and all evidence must be linked to one another in a succinct and logical manner. Photographs taken from crime scenes must make sense to the individuals who will eventually use them in determining the significance of the evidence, as well as those who will use them when deciding the fate the accused. As a general rule, nothing in the scene should be moved, altered, or collected until it has been photographed. There are three standard perspectives that must be included during crime scene photography: overall, intermediate and close-up. Each perspective is interdependent upon the other to do its job in telling the entire crime-related story. In order for this process to work seamlessly, the photographer must integrate the proper techniques during each perspective. The photographer must not skip a step between overall and close-up photography, nor should the photographer skip the overall or close-up perspectives because they feel that they have accomplished those objectives in documenting an item of evidence during another perspective. But first, there are three rules that the crime scene photographer should always keep in mind:

The Three Rules of Crime Scene Photography

1. Fill the frame.
2. Maximize depth of field
3. Keep the film plane parallel with the subject.

OVERALL

**Overall photography** - In order for the significance of any item of evidence to make sense to the viewer it must be logically related to the scene. In order for the location and conditions of the scene to make sense to the viewer it too must be related logically. Overall photography is the perspective that relates the entire scene to its physical surroundings.

**Perspective** - If at all possible during overall crime scene photography the photographer should make every attempt to document the scene accurately by selecting the correct perspective. The correct perspective for this type of photography is full standing height, or a natural perspective. Elevated, kneeling, or prone perspectives can skew and distort the accuracy of the scene, which could make the photograph arguably inadmissible due to its inaccuracy. Elevated and lower than normal angle views may be very helpful in the investigation, but should be supplementary to the normal standing views.
**Exterior overall**s- When documenting the location of a crime, search warrant, or law enforcement event, the photographer should properly and completely document the entire exterior of the location. Whether it is a property crime, death investigation, search warrant, or violent crime against a person, the significance of items located within the scene at the time of the investigation may not be immediately known, and could go undocumented if not photographed properly. The photographer should be mindful of equipment introduced into the scene by them or their colleagues. Items like crime scene kits, camera bags, purses, or other personal effects that are set down upon arrival should be noted or removed from the scene prior to beginning the photography.

**Begin with landmarks**- Overall exterior views should start with landmarks that put the scene in geographical perspective to the viewer. Street signs, intersections, and house numbers are landmarks that should be included in this type of photography if possible. When shooting street signs of an intersecting roadway, emphasis should be given to the street that the incident occurred on. A method of doing this is to photograph the street sign of interest with the film plane parallel to that particular sign.

- **Lens and angle selection**- Photographs of the exterior of residences and buildings should be taken with a normal perspective lens (50mm or 50mm equivalent*), and should be taken at right angles to one specific side of the structure at a time (film plane parallel to one side of the building). Shooting from a corner of a structure, or diagonal view, can cause a distorted perspective. Although these views can be included, and may be helpful in establishing relationships between points of ingress and egress, they should be supplemental to the standard right angle parallel views. When documenting an extremely large structure, overlapping photographs may be necessary, and should be taken from the same distance each time.

- **When evidence is located outside of the primary scene**- In many cases, the crime scene and associated evidence is not isolated to the interior or exterior of a residence or structure. Many crimes leave a trail of relevant evidence from the exterior of the residence to a particular room within the residence, or from a room within the residence to the exterior, and perhaps through the yard and even down the block. When evidence is encountered at the exterior of the residence, it should be properly documented with relationship and close-up photography prior to proceeding into the residence. This becomes particularly necessary when evidence must be quickly collected due to the hostility of a particular environment, including the risk of theft or destruction of evidence.

**Interior overall**s- Upon the completion of the exterior overall photography the interior overall views should be captured. Using a standard lens when possible (50mm or *50mm equivalent) the photographer should begin the photography at the threshold of each door, shooting into the room. In extremely small rooms, it may be necessary to use a wider angle lens in conjunction with the standard lens to properly document the room. In cases where a wide angle lens is necessary, the photographer could choose to select from a 28mm to a 35mm lens. These focal lengths will begin to introduce some wide-angle distortion; however, are typically acceptable in most situations. The photographer should be prepared to defend his or her decision for lens selection based on the small or confined area, as the wider angle lenses tend to make the scene
look larger or deeper than it actually is. When the actual physical size of the room is of importance to the case at hand (e.g. violent crime against a person), the use of a wide angle lens is discouraged due to its potentially distorting effects.

**Four corner photography** - In many cases where the actual physical size of a particular room is irrelevant (search warrant for drugs or stolen property etc.) a four corner photography technique with a wider angle lens may be appropriate. In rooms that are square, somewhat square, or rectangular the photographer can shoot at opposing corners from an opposing corner. When using a wide angle lens the overall interior photography may be able to be completed in as little as four shots. When the room contains closed doors and closets, the photographer should document the room in its condition of discovery, and then follow up with a sequence of shots with the closets and closed doors in the open position to show the items contained within the closets. When photographing closets the photographer should position the film plane of the camera parallel to the wall containing the closet or closed door.

**Parallel overall interior photography** - When the physical size of the room is of importance to the type of crime being investigated, the type of photography to accurately illustrate the scene is also of importance. When contrasted with other photographic techniques, photographing interior walls with the camera’s film plane parallel to the wall being photographed, while using a normal perspective lens, is the best approach. This technique eliminates spatial distortions caused by wider angle lenses, and any distortion caused by off angle or diagonal photography. This method also ensures proper and even illumination when using a flash to photograph the interior of a scene, and ensures a consistent depth of field. Although more images may be necessary to completely document the scene, one must always remember that film is cheap and digital images are even cheaper. As with the four corner photography technique, when the room contains closed doors and closets, the photographer should document the room in its condition of discovery, and then follow up with a sequence of shots with the closets and closed doors in the open position to show the items contained within the closets. When photographing closets, the photographer should position the film plane of the camera parallel to the wall containing the closet or closed door. An off camera or remote flash technique may be necessary to properly illuminate larger closets.

**Victim’s perspective** - In many cases it may be helpful to obtain photographs of the victim’s perspective as he/she stood at a particular door looking out. Home invasion robberies, forcible burglaries, or assaults that occur upon opening the door of a residence are examples of when this added perspective may be helpful.

**INTERMEDIATE/MIDRANGE**

**Intermediate photography** is the perspective between overall and close-up that is used to relate items of evidence to a fixed feature within a scene. An example of this may include the location of a handgun, and its relationship to the front door. A “fixed feature” is just that, it is fixed. Large furniture objects, appliances, dead bodies, household pets and vehicles are not fixed features within a scene due to their potential
for mobility. A fixed feature is structurally fixed within a scene, a feature that would require structural demolition to change, remove, or alter. Inside corners, outside corners, door jams, and base boards are all examples of interior fixed features. Exterior fixed features may include a sidewalk, fire hydrants, telephone poles, the corner or side of a structure, a fence post, or perhaps a utility enclosure.

**Avoid distorting perspectives** - In order to ensure accuracy during relationship photography the photographer should select the correct focal length lens as well as the correct perspective. The location that the photographer is standing when the shutter release is depressed should be a location that he or she intentionally selected in order to achieve the best results, not a haphazard location that just seemed convenient at the time. One school of thought on this particular subject integrates an imaginary isosceles triangle approach into midrange photography. In doing this, the photographer draws an imaginary line between the subject of the photograph (the evidence) and a fixed feature within the scene, for the sake of argument a line between a handgun and a door jam. The photographer then distances him/herself equidistant from the evidence and fixed point in a location that would complete the imaginary isosceles triangle. The photograph is then properly composed and taken at full standing height. Lower angle photography may be necessary in certain situations when items of evidence are concealed in locations that offer additional challenges, such as under a bed or under a vehicle. Lower or elevated angle photography during the relationship perspective should be avoided when possible due to its potential to distort distance relationships between fixed features and evidence. Higher angles tend to suggest more distance from near to far in an image while lower angles tend to suggest a decrease in distance between objects in a photograph. Distorted views during this type of photography are entirely counterproductive to the intended goal. Although various angles of view may be helpful to the investigation, they should be supplementary to the natural standing perspective.

**Proper composition** - Composition in photography is often what "makes" the photograph in portrait, landscape, architectural, and creative photography. Composition in law enforcement photography is also very important, and is technical in nature. The dominant themes surrounding law enforcement photography are accuracy and specificity. Specific items should be photographed in such a fashion that they are an accurate representation of what was at the scene when it was documented. Items not intended for graphical illustration should be excluded from the compositions. Objects and surroundings that tend to distract from the intended subject, the evidence, should not be included in the composition. The photographer during all phases of crime scene photography should concentrate on illustrating the specific intended subject while also concentrating on intentionally excluding non-relevant subjects and objects. Distracting and non-relevant subjects, objects or items may confuse the viewer, the Judge or Jury, of a law enforcement photograph as to the intended subject. These sloppy compositions may also provide defense council with non-relevant hypothetical scenarios that can be used against the photographer or merits of the case during court proceedings.

CLOSE-UP
Close-up Photography- Now that the scene has been put in context with its
surroundings (overall photography), and the evidence has been related to a fixed feature within the scene (intermediate photography), the actual evidence that is so important to the investigation can be properly photographed. The close-up perspective is the final perspective necessary in completing the crime related photographic story. These views are very specific and their compositions distinctively isolated to one item of evidence at a time. This is not the time to get lazy by documenting multiple items of evidence with one photograph. It is that final interdependent process that is as important as the previous two.

**Each item of evidence must be photographed with a close-up perspective.** If there are fifty items intended for collection, then there should be at least fifty full-frame, close-up images of each of those items. Close-up images should be carefully composed. Any other item, object, or background other than the intended item should be intentionally excluded from the composition. Close-up photographs should be taken prior to the evidence being moved or handled, “as is”. The photographer should be able to testify that these images of evidence are as they were discovered, are unaltered, and depict the evidence prior to it being moved or handled by law enforcement.

**Fill the frame.** When conducting close-up photography the item of evidence must fill the frame as much as possible. A tight crop is preferred during close-up photography in order to force the viewer’s attention to only the object of consideration.

**Lens selection is an important element for consideration during close-up photography.** Not all lenses are created equally. During close-up/evidence photography a close-up lens should be used. Most lenses have different minimum distances at which they can focus. Many lenses will offer a 1:1 or 1:2 reproduction ratio. Close-up lenses come in a variety of focal lengths, but can focus at much closer distances than most standard lenses. The closer the lens is to the evidence when photographed the better. Reducing the distance between the lens and the subject during photography increases the resolution and the latitude for enlargement and enhancement. Every crime scene photographer’s kit should include a close-up lens.

**The strict and specific composition adhered to during close-up photography should also be complimented by a proper framing technique.** When an object or item being photographed has a specific geometric shape, it should be framed in the viewfinder squarely prior to being photographed. Using the horizontal and vertical boundaries inherent in any SLR camera viewfinder to achieve the proper framing will aid in acquiring a professional composition that can be used as a courtroom exhibit with absolutely no editing. Many of today’s camera systems offer an optional grid display that can be activated through a menu option. This is useful tool in the critical framing during close-up evidence photography.

**SCALES**- Close-up photographs should be taken without and with a properly labeled scientific scale. Every crime scene photographer’s kit should include a variety of photo scales to be used during evidence photography. There are a host of shapes, sizes, and colors of scales available through multiple police and forensic supply vendors. Initially the close-up photographs should be taken without a scale, an “as is” photograph. For a gauge of size, actual 1:1 size duplication, calibration or enlargement a scale must be
included in the image. The scale should be placed in a location in the image that will not compromise or contaminate any evidence. In the presence of biological hazards a disposable scale should be considered.

- **Placement of the scale** - The scale should be situated along side of the evidence at the same focal plane as the actual object or impression. The scale should be placed in the scene squarely with the object, with the proper framing composition in mind. A disposable adhesive label should be placed on the scale when possible to reference the item of evidence being photographed, the date, case number and photographer’s name. Following this procedure will help eliminate the potential for unnecessary evidentiary hearings or testimony concerning the authenticity of the item of evidence being photographed.

- **Angular distortion should be avoided during close-up photography**. When possible, close-up photographs should be taken at a 90° angle to the camera’s sensor or film plane. The use of a tripod, quadpod, or copy stand is helpful in this endeavor. An angle level may also be used in transposing unknown angles from awkward terrains back to the tripod mounted camera. Close-up photographs intended for later analysis or introduction into an AFIS or other similar forensic database for query may be rendered useless if captured at angles other than 90°.

- **“As is” versus secondary close-up photography**. After an item of evidence is photographically documented “in place”, both without and with a scale, it may be moved from its original location for additional photography. It may be impossible to completely and properly photograph all items of evidence “in place” due to their often times difficult locations of discovery. After making a good faith effort to properly document an item of evidence in place, it can be moved to a suitable location for additional photography. A reference should be noted on the photo log concerning the secondary location. If an item is moved from its original location for additional photography, the photographer should select a suitable and neutral colored background. The use of a gray card can often provide a professional looking background, while at the same time aiding in achieving the correct pre or post capture exposure.

**Chapter Review**

The technical and structured approach to photographically documenting a crime scene is designed in such a fashion that it provides a comprehensive, succinct, and permanent record of the scene and all associated evidence in its condition upon discovery. These images, if properly taken, have the potential of becoming valuable evidence to use in determining guilt during criminal proceedings. Properly taken crime scene photography is also a valuable tool used by investigators during the reconstruction of events leading up to and following the commission of a violent act or incident.

Crime scene and evidence photography is a technical and structured process that requires a very specific set of well thought of compositions, overall, intermediate, and close-up. The proper compositions in crime scene photography are designed to put the
scene in context with the evidence and the evidence in context with the scene. This
systematic approach in documenting crime scenes ensures that an accurate story
regarding the incident, the scene, and the evidence can one day be told through
photography.

Glossary of Photographic Terms

A

Aberrations

Chromatic
Longitudinal and lateral chromatic aberrations. Unless corrected, the different
colors of white light will separate and focus at different points. The result is color
fringing, where the edges of objects appear to have strange bands of color.

Spherical
The outer part of a lens will bend/refract light differently than the middle or central
part, so that all the light does not focus at the same point. The result is soft focus
rather than clear, crisp detail.

Coma
Off-axis detail will not focus sharply on the film or digital sensor.

Astigmatism
Off-axis points in the scene will appear as lines or ovals on the image instead of
distinct points.

Curvature of field
A subject that is completely flat will be focused sharply in the center of the image,
but toward the periphery of the image, the image is softer or slightly out of focus.

Aliasing
The digital effect of a jagged appearance of diagonal lines, edges of circles, etc.
caused by the square nature of most pixels, also known as ‘jaggies’.

Ambient Light
The available light completely surrounding a subject. Light already existing in an
indoor or outdoor setting that is not caused by any illumination supplied by the
photographer.
Angle Of View

The area of a scene that a lens covers or sees. Angle of view is determined by the focal length of the lens. A wide-angle lens (short-focal-length) includes more of the scene—a wider angle of view—than a normal (normal-focal-length) or telephoto (long-focal-length) lens.

Aperture

The opening in a camera lens through which light passes to expose the image on the film or digital sensor. The diameter of a camera lens opening, expressed by the \( f \) stop number. The term \( f \) stop relates to a fractional relationship between the focal length of the lens and the diaphragm opening. E.g. in the case of a 50mm lens, if the aperture is set to \( f/8 \), the size of the opening that allows light to pass is \( 50/8=6.25 \text{mm} \), the measured opening in the lens. Aperture controls the volume of light by physically allowing more or less through the lens at any one given time. Aperture also influences the area of acceptable sharpness in an image, also known as depth of field (DOF).

Aperture Priority

An exposure mode on a programmable camera that lets you set the aperture while the camera sets the shutter speed for the proper exposure. If you change the aperture, or the light level changes, the shutter speed changes to provide a correct or reciprocal exposure. This mode is used when the photographer’s primary goal is to control the depth of field in an image. Identified as an “A” on the mode dial of many cameras, often mistaken for a fully “Automatic” mode.

Aspect Ratio

The ratio of width to height in photographic prints - 2:3 in 35 mm pictures to produce photographs most commonly measuring 3.5 x 5 inches or 4 x 6 inches;

Autofocus (AF)

A system by which the camera lens automatically focuses on a selected area of an image. Many camera systems will allow the photographer to select from one of dozens of areas within the frame as a ‘point of focus’ when using auto focus. The lens and camera use contrast sensitive algorithms and 3D information to detect and select the proper focus.

Automatic Camera

A camera with a built-in exposure meter that automatically adjusts the lens opening, shutter speed, or both for proper exposure.

Blinking Highlights

The highlights feature in digital cameras will blink on and off during preview. This
feature allows the user to identify areas within the image where an overexposure has occurred, or where no detail remains due to a ‘clipping’ of the highlights.

B (Bulb) Setting
A shutter-speed setting on an adjustable camera that allows for time exposures. When set on B, the shutter will stay open as long as the shutter release button remains depressed. To help eliminate camera shake, it is essential to utilize a remote control device to activate and deactivate the shutter curtain when using this mode.

Background
The part of the scene that appears behind the principal subject of the picture.

Backlighting
Light coming from behind the subject, toward the camera lens, so that the subject stands out vividly against the background. Sometimes produces a silhouette effect. Backlighting techniques can also be used in forensic photography to bring out detail on transparent surfaces, e.g. visible latent fingerprints on clear tape or glass.

Balance
Placement of colors, light and dark masses, or large and small objects in a picture to create harmony and equilibrium.

Barrel Distortion
Wide and super wide angle lenses cause vertical elements in an image, e.g. sides of buildings, poles, etc., to bow out like the sides of a barrel.

Bellows
The folding (accordion) portion in some cameras that connects the lens to the camera body. Also a camera accessory that, when inserted between lens and camera body, extends the lens-to-film distance for close focusing. Can be used during forensic close-up photography to bring out extremely small detail in a subject.

Bit
The smallest unit of digital memory; a contraction of “binary” and “digit”.

Bit Depth
Bit depth quantifies how many unique colors are available in an image's color palette in terms of the number of 0's and 1's, or "bits," which are used to specify each color. This does not mean that the image necessarily uses all of these colors, but that it can instead specify colors with that level of precision. For a grayscale image, the bit depth quantifies how many unique shades are available. Images with higher bit depths can encode more shades or colors since there are more combinations of 0's and 1's available.
Bounce Flash/Lighting

Flash or tungsten light bounced off a reflector (such as the ceiling or walls) to give the effect of natural or available light. Using a bounce flash technique reduces or eliminates hard edge shadow detail from subjects.

Bracketing

Taking additional pictures of the subject through a range of exposures-both lighter and darker, commonly used to ensure the correct exposure.

Burning

A digital imaging tool used to provide localized adjustment by darkening areas that require additional contrast. Considered a traditional enhancement by SWGIT due to its roots in conventional silver based photography.

CCD (Charge Coupled Device)

A common digital camera sensor type, probably the most common type.

CD-R

Write once Compact Disc Recordable. The preferred type in law enforcement due to the write once only format.

CD-RW

A re-writable CD format that can be appended to, or re-used. Not the preferred type of media to archive LE digital images.

Center Weighted

A camera metering mode by which the exposure is determined primarily from the light coming from a large oval in the center of the composition, or field of view. A common metering mode used during portrait photography, more critical than a Matrix metering mode, and less critical than a Spot metering mode.

Circle of Confusion

As focused light comes from the lens towards the film plane, it travels in a narrowing cone until it meets at a precise point on the film plane, where the image is judged to be in focus. The selected lens aperture will control how light that enters the lens will be distributed on the film or sensor. If the light waves focus before reaching the film plane, they begin diverging and form a circle on the film plane. If the light waves have not yet focused to a point by the time they...
reach the film plane, they will also form a circle on the film plane. The human eye perceives some of these smaller circles to still be in focus. Circles larger than a certain size are perceived by the eye to be out of focus, or “confused.” Smaller apertures will produce smaller circles of confusion and larger apertures will produce larger circles of confusion. It is the circles of confusion that are directly related to the depth of field in a given image. Smaller apertures generally produce greater apparent focus in a photograph. The concept of circles of confusion helps explain why there is only one “true” point of focus in any image, however the perception of focus can be achieved both in front of and behind the actual focused subject.

Close-Up
A picture taken with the subject close to the camera-usually less than two or three feet away, but it can be as close as a few inches.

Close-Up Filters
A series of lens attachments that can be threaded into the front element of a lens that allows the photographer to acquire images at a closer distance than the camera lens alone will allow. These can be used individually, or stacked to achieve further enlargement.

CMOS (Complementary Metal Oxide Semiconductor)
A type of digital camera sensor. This type of chip is gaining a lot of popularity in the prosumer and professional digital SLR camera lines.

CMYK (Cyan-Magenta-Yellow-Black)
Primary subtractive colors. When projected together over the same area they block all light, resulting in black (the K designates black).

Color Balance
How a color film reproduces the colors of a scene. Color films are made to be exposed by light of a certain color quality such as daylight or tungsten. Color balance also refers to the reproduction of colors in color prints, which can be altered during the printing process.

Color Noise
Better known as chrominance signal-to-noise ratio. A measure of how accurately the color signals are reproduced. Poor chroma signal-to-noise ratios are evidenced in color fringing on edges of objects and what appears to be thousands of moving dots in large areas of highly saturated colors (especially red).

Color Output
The playback output level of the color (chrominance) signal after it is separated from the luminance signal.

Composition
The pleasing arrangement of the elements within a scene—the main subject, the
foreground and background, and supporting subjects.

**Compression**

To reduce file sizes so that more files can be stored in the space or easily transmitted over the Internet. Compression algorithms search for redundant information, e.g. similar colors or contrasts, and discard that information. JPEG is referred to as a lossy compression, as it permanently discards the redundant information. RAW and TIFF are considered lossless compression, that preserve all information. Higher levels of compression will result in lower quality images.

**Contrast**

The range of difference between the light to dark areas in an image.

**Cropping**

Trimming off unwanted parts of an image.

**Crop Factor**

This generally indicates that the sensor size is physically smaller when compared to a 35mm negative, and that a crop factor will be present. For Nikon crop factor is 1.5x whereas with Cannon it is roughly 1.6x. Also see DX.

**Crop tool**

A digital imaging software tool that is used to trim a photo and is usually represented by a scissors icon.

**D**

**Darkroom**

A light-proof area used for processing films and for printing and processing papers.

**Dedicated Flash**

A fully automatic flash that is integrated into a camera’s body. Dedicated flash units automatically set the proper flash sync speed and electronic sensors within the camera automatically control exposure by regulating the amount of light from the flash. The onboard flash system on most consumer camera systems are considered a dedicated flash.

**Definition**

The clarity of detail in a photograph.

**Density**
The blackness of an area in a negative or print that determines the amount of light that will pass through it or reflect from it. Sometimes referred to as contrast.

**Depth of Field**

The amount of distance between the nearest and farthest objects that appear in acceptably sharp focus in a photograph. Depth of field depends on the lens opening, the focal length of the lens, and the distance from the lens to the subject.

**Diaphragm**

Lens opening. A perforated plate or adjustable opening mounted behind or between the elements of a lens used to control the amount of light that reaches the film. Openings are usually calibrated in f-numbers.

**Diffraction**

Light striking an edge will bend and no longer proceed in a straight line. Light coming through a lens with the smallest apertures is more affected by diffraction, because most of the light forming the image is diffracted light. Diffracted light results in soft focusing and the loss of edge detail. When maximum depth of field is required, many photographers will select the smallest camera aperture. This may produce counterproductive results in terms of focus. A slightly wider aperture, two or so stops from the smallest opening, may in fact produce a sharper focused image because more light comes through the center of the aperture, where it is not affected by diffraction.

**Diffuse Lighting**

Lighting that is low or moderate in contrast, such as on an overcast day. Can also be used in conjunction with an electronic flash or dedicated light source by placing a translucent material over the light source to soften and distribute its effects.

**Digital Noise**

Randomly spaced brightly colored pixels that speckle and reduce image clarity. Can often be visualized as red, green, or blue globules of color speckled about the dark areas in an image. Mainly caused by long exposures or by high ISO settings in a digital camera.

**Diopter Adjustment**

Many of today’s digital SLR camera systems come equipped with an eyepiece adjustment. This adjustment is known as a Diopter adjustment, and can be adjusted to the vision of the photographer.

**Dodging**

An image software tool used for localized contrast adjustments that will lighten the areas.

**Double Exposure**

Two pictures taken on one frame of film, or two images printed on one piece of
photographic paper. Many consumer and prosumer cameras come equipped with a 'multiple exposure' option in the menu that can be used to produce this effect. This effect can also be done by merging layers in an imaging software application.

**Download**

Transferring files or other information from a camera, media card, CD, DVD, hard drive, or the Internet to a computer.

**DPI (Dots Per Inch)**

A measure of resolution of a photo printer based on dot density.

**Dynamic Range**

A measure that reflects a camera’s ability to capture a range of light levels from the highlights to shadows. The better the range, the more information that is available during post capture forensic image processing.

**Emulsion**

Micro-thin layers of gelatin on film in which light-sensitive ingredients are suspended; triggered by light to create a chemical reaction resulting in a photographic image.

**Enlargement**

A print that is larger than the negative or slide; a blowup.

**Existing Light**

Available light. Strictly speaking, existing light covers all natural lighting from moonlight to sunshine. For photographic purposes, existing light is the light that is already on the scene or project and includes room lamps, fluorescent lamps, spotlights, neon signs, candles, daylight through windows, outdoor scenes at twilight or in moonlight, and scenes artificially illuminated after dark.

**Exposure**

The quantity of light allowed to act on a photographic material; a product of the intensity (controlled by the lens opening) and the duration (controlled by the shutter speed or enlarging time) of light striking the digital sensor (controlled by the sensitivity of the sensor, or ISO).

**Exposure Latitude**

The range of camera exposures from underexposure to overexposure that will produce acceptable pictures from a specific film.

**Exposure Meter**
An instrument with a light-sensitive cell that measures the light reflected from or falling on a subject, used as an aid for selecting the exposure setting. The two types of light meters are the incident and the reflective. Incident light meters are generally handheld devices that can measure the precise amount of light at or striking a particular subject. A reflective light meter, the kind that is internal in most digital SLR camera systems, differs from an incident light meter in that it measures light reflecting from a subject, not striking it.

**Exposure Mode**

Most digital cameras have a host of ‘exposure modes’ to select from. The common exposure modes available in most digital SLR camera systems include the following:

**Programmed Automatic** – camera selects shutter speed and aperture based on ambient lighting conditions in an attempt to achieve a correct exposure.

**Shutter Priority** – camera user selects a shutter speed based on a motion controlling objective and the camera provides the necessary aperture to achieve the correct exposure.

**Aperture Priority** – camera user selects the aperture based on a depth of field related objective and the camera provides the necessary shutter speed to achieve a correct exposure.

**Manual** – camera user selects the desired aperture and shutter speed that provide the desired effect. To achieve a correct exposure in this mode, the photographer must balance the camera’s reflective light meter by use of any of the three available exposure controls e.g. aperture, shutter speed, or ISO.

**Automatic** – camera controls exposure automatically and will use flash when needed to illuminate the scene or to photograph at an acceptable shutter speed, e.g. 1/60th of a second.

**Exposure Value Compensation**

Also known as EV Compensation, referenced on many digital SLR camera systems as +/-, allows the photographer to intentionally over or under expose an image from what the camera believes to be the ‘correct’ exposure. Many cameras allow for a five stop either direction exposure control range.

**Extension Tube**

A hollow lens like device that integrates between a camera lens and a camera body. This device decreases the minimum focusing distance of a lens by moving the prime lens elements further from the subject. Extension tubes can be used individually, or stacked together to increase the magnification of a subject.

**Field of View**

The angle of view or area of coverage of a particular lens. Wider angle lenses
will result in an increased angle of view, e.g. fisheye lenses, or a lens with a
super wide designation. Telephoto lenses result in a decreased field of view
when compared to wide or normal focal length lenses.

File

A collection of information, such as data, images, or text that can be saved on a
disc, hard drive, or external media. Also, a term used to describe an individual
digital image.

File Format

A selected program type of data file. In digital photography, common file formats
include JPEG, NEF(RAW), TIFF.

Fill-In Light/Fill Flash

Additional light from a lamp, flash, or reflector; that is used to soften or fill in the
shadows or dark areas in an image. Called fill-flash when an electronic flash is
used. Useful in law enforcement photography to illuminate evidence concealed
by shadows.

Film Speed

Also known as ISO. The sensitivity of a given film or digital sensor to light,
indicated by a number such as ISO 200. The higher the number, the more
sensitive or faster the film speed. Note: ISO stands for International Organization
for Standardization.

Filter

A piece of glass or other transparent material used over the lens to
emphasize, eliminate, or change the color or density of the entire or certain
areas within a scene. Polarizing filters, neutral density filters, tinted gradient
filters, and solid primary colored filters are examples of a filter. When
considering a filter for purchase you should ensure that the selected filter
matches the front element size of the lens that the filter is purchased for.

Fixed Focal Length Lens

A lens that has only one focal length, and cannot zoom to a wider or more
telephoto focal length. These types of lenses for SLR camera systems are
generally more efficient in terms of their light gathering abilities due to the
increased size of their widest aperture. Close-up lenses are commonly fixed
focal length lenses.

Fixed Lens Camera

A non detachable lens, generally compact point and shoot camera systems come
equipped with a wide angle to telephoto fixed zoom lens that is not detachable.

Flare (Lens Flare)

Visible multi-colored octagonal shaped artifacts rendered in images that were
taken when unwanted stray sunlight, or other strong light, streamed directly into the camera lens. Lens flare can also cause a reduction in contrast in the image. Wider angle lenses are more susceptible to lens flare. A lens hood is the device intended to reduce or eliminate lens flare. When a lens hood is not available, holding a hand, note pad or other object above the front element of the camera lens can reduce or eliminate the flare.

**Flash**

A brief, intense burst of light from an electronic flash unit, usually used where the lighting on the scene is inadequate for hand held photography.

**Flash Diffusion**

Direct flash is very harsh and often times uncontrollable when used at close and medium distances to the subject. Placing a diffusion material between the flash and the subject can provide more evenly distributed lighting. This even pleasing light is the result of increasing the surface area that the light is emitted from, while at the same time dampening its effects. Flash diffusion works very well when conducting close-up evidence grade photography of highly reflective subjects, e.g. guns, jewelry, edged weapons. A simple and highly effective field expedient diffusion device is a white Styrofoam cooler. A hole is cut in the top of the cooler for the lens and the flash is fired remotely while outside of the cooler, providing a even wrapping consistent shadow-less light on virtually any surface.

**Flat Lighting**

Lighting that produces very little contrast or modeling on the subject plus a minimum of shadows.

**F Number**

Also referred to as *f* stop. The designation for the optical opening in the camera lens that corresponds to the lens focal length divided by the setting, which will give the measured opening in the aperture of the lens. The common f-numbers are f/1.4, f/2, f/2.8, f/4, f/5.6, f/8, f/11, f/16, and f/22. The larger the f-number, the smaller the lens opening. In this series, f/1.4 is the largest lens opening and f/22 is the smallest. A doubling or halving of light occurs with each full stop incremental change.

**Focal Length**

Technically defined as the distance between the film and the optical center of the lens when the lens is focused on infinity. The focal length of the lens on most adjustable cameras is marked in millimeters on the lens mount. As a general rule, the wider the angle the lens the further the subject appears in the viewfinder and the wider the field of view. The more telephoto the lens, the closer the subject appears in the viewfinder and the smaller the field of view. A 50mm lens in 35mm film format is considered a ‘normal’ focal length lens. The equivalent to a ‘normal’ perspective lens in a DX format digital camera is approximately 33 mm.

**Focal Length Multiplier**
Relates to the physical size of the sensors in digital cameras. Many digital sensors are physically smaller than the small format film negative, causing a crop factor. See crop factor for additional information.

**Focal-Plane Shutter**

An opaque curtain located immediately in front of the sensor in a digital SLR camera that moves directly across, usually vertically, to allow image-forming light to strike the sensor.

**Focus**

The setting on the camera lens that focuses light so that it converges at a precise point on the film or sensor plane. Most lenses are equipped with automatic and manual focus options.

**Focus Range**

The range within which a camera is able to focus on the subject, e.g. 4 feet to infinity. Shorter focal length lenses generally have a closer minimum focusing distance than do telephoto lenses. Specialty lenses intended for close-up photography commonly have focusing distances under twelve inches.

**Foreground**

The area between the camera and the principal subject.

**Forensic Photography**

The application of specialized photography techniques to questions of criminal and civil law.

**Frame**

One individual picture on a roll of film or digital media. Also, foreground foliage or objects that frame a subject.

**Front Lighting**

Light shining on the subject that originates from behind the photographer.

**G-J**

**GN (Guide Number)**

An indication of the relative power and effective distance range of an electronic flash unit.

**Gaussian Blur**

A technique/tool used in imaging software that will allow the user to intentionally blur detail in an image, a post capture editing technique.

**Gigabyte**
One thousand twenty four (1,024) megabytes.

**Graininess**

The sand-like or granular appearance of a negative, print, or slide. Graininess becomes more pronounced with faster film and the degree of enlargement. Analogous to noise in digital images taken with high ISO settings.

**Gray Card**

A gray in color card calibrated at 18% reflectance. Gray cards are used to achieve the correct exposure when photographing other than average reflective subjects, e.g. predominantly black or white subjects.

**High Contrast**

A wide range of density in an image.

**Highlights**

The brightest areas of a subject and the corresponding areas in an image.

**Highlights Preview Mode**

A preview mode in many digital camera systems that displays the highlights of an image by blinking on and off in areas that are totally white. Previewing in this mode allows the user to determine if any ‘clipping’ of highlights, or gross overexposure, has occurred.

**Histogram**

A bar graph that is used to identify the contrast and dynamic range of an image. This graph is available during in camera review and during post capture software editing/review.

**History**

As digital images are ‘processed’ to improve the overall image, or an isolated portion thereof, a record of the processing steps, levels, and techniques should be maintained for later court purposes. Adobe Photoshop® CS, and certain other image editing software, allows the user to activate a history option that will record the detail of all changes to an image in a separate file.

**Hot Shoe**

The fitting on a camera that holds a small portable flash. It has an electrical contact that aligns with the contact on the flash unit's "foot" and fires the flash when you press the shutter release. This direct flash-to-camera contact eliminates the need for a PC cord.

**Hue**

A gradation of color, applicable to the entire range of colors in the spectrum. When digital images are captured with an inaccurate white balance setting they will often have an obvious hue, or color cast, that is inconsistent with the actual colors at the scene.
Hyperfocal Distance

Distance of the nearest object in a scene that is acceptably sharp when the lens is focused on infinity.

Image Stabilization

A feature built into a camera lens or camera body that reduces the effects of ‘camera shake’. Most SLR camera systems integrate image stabilization into the lenses rather than the camera bodies. This technology works very well, and can allow a trained photographer to record sharp detail at up to four full shutter speed stops slower than was otherwise possible while hand holding a camera. An essential tool for low light hand held photography, e.g. surveillance photography etc. Also commonly referred to as Vibration Reduction (VR).

Incident Light Meter

A portable light meter that reads light levels falling on a subject, rather than reflecting from a subject. This is the other type of meter that can be used to achieve a correct exposure and are potentially more accurate than a reflective light meter, which are the meters standard in SLR camera systems. Commonly used by professional and portrait photographers.

Interpolation

The process whereby an image-editing program adds supplemental pixels that are created from the image’s existing, neighboring pixels – in effect creating a file with more image data and thus potentially producing better image output.

Inverse Square Law

The law related to light that states that light diminishes by the inverse square of the distance traveled. As the distance light travels doubles, its intensity is quartered. This is a law that is frequently considered when conducting manual flash photography.

ISO Speed

The speed (sensitivity) of the imaging sensor, or film, as determined by the standards of the International Standards Organization.

JPEG (Joint Photographic Experts Group)

A standard for image compression. An image format that is considered ‘lossy’, as it permanently discards redundant information, colors and contrast details, from the file. This compression algorithm takes 8 x 8 areas of pixels and compresses the information to its lowest common value. As a general rule, more compression = lower quality images with limited enlargement and analysis potential. JPEG Fine Large setting is considered an acceptable minimum setting for law enforcement digital imaging.
**LCD (Liquid Crystal Display)**

The screen on cameras that displays the captured image for review, as well as the menu and any other internal camera information.

**Lens**

One or more pieces of optical glass or similar material designed to collect and focus rays of light to form a sharp image on the imaging sensor, film, paper, or projection screen.

- **Close-up Lens:** Designed to produce magnifications allowing small items such as fingerprints, shell casings, and blood spatter to ‘fill the frame’.
- **Normal Lens:** A 50mm lens for a 35mm negative/sensor based SLR camera system. Normally, a focal length equivalent to the diagonal of the film or sensor. With many digital SLR cameras, a 'normal' lens is approximately 33 mm (due to crop factor). Provides a close approximate to 'what we see' in terms of field of view.
- **Telephoto Lens:** A lens longer than 50mm (33mm in DX digital).
- **Wide-Angle Lens:** A lens shorter than 50mm (33mm in DX digital).
- **Zoom Lens:** A lens that can be set to a range of focal lengths, or 'zoomed'.
  - **Fixed Focal Length Lens:** A lens that has only one focal length, generally faster in terms of their light gathering ability.
  - **Catadioptric Lens:** A lens design that uses a mirror to capture and project light. Generally shorter in construction, and slower in terms of light gathering ability than a refractive glass lens.
  - **Refractive Glass Lens:** Typical glass lens construction, the most common type.

**Lens Shade**

A collar or hood at the front of a lens that keeps unwanted light from striking the lens and causing image flare. May be attached or detachable, and should be sized to the particular lens to avoid vignetting.

**Lens Speed**

The largest lens opening (smallest f-number) at which a lens can be set. A fast lens transmits more light and has a larger opening than a slow lens.

**Light meter**

(See Exposure meter/Incident Light Meter)
Lossless Compression

A method for reducing the size of a photographic file so that when it is uncompressed, the resulting image matches the quality of the original source. TIFF is a lossless compression format.

Lossy Compression

A reduction in image file size by disposing of redundant data (colors/contrasts), resulting in a degradation of image quality. See JPEG for additional information.

Macro Lens

A lens that provides continuous focusing from infinity to extreme close-ups, often to a reproduction ratio of 1:2 (half life-size) or 1:1 (life-size). See lens for additional information.

Matrix-Metering

An advanced camera light metering system using a multi-segment sensor and computer to establish a proper 'average' exposure for an entire scene. Produces good results in most applications.

Megapixel

One million pixels (picture elements).

Metadata

Embedded information in a digital image (file) that contains file number, date, time, camera make, model, focal length, exposure settings, and other important data.

Mini-lab

Photofinishing operation that operates on a retail level, serving consumers directly and processing film on-site.

Mirror Lock-up

A feature in many digital SLR camera systems that allows the user to physically lock the camera’s internal mirror in the up position, as if taking an image. This allows access to the camera’s imaging sensor for inspection and cleaning. This feature can also be used when making a timed exposure, to reduce the internal camera movement (vibration) that may cause a slight blur during a long exposure when the mirror slaps to the open and closed position.

Monopod

A portable single leg camera support used to control camera shake and vibration during longer exposures. Commonly used with long focal length lenses typical in sports photography and surveillance photography.

NEF (Nikon Electronic Format)

Nikon’s proprietary RAW format.

Noise
Visible artifacts in a digital image, common with long exposures and high ISO photography. See digital noise for additional information.

**Normal Lens**
A lens that makes the image in a photograph appear in perspective similar to that of the original scene. A normal lens has a shorter focal length and a wider field of view than a telephoto lens, and a longer focal length and narrower field of view than a wide-angle lens. See lens for additional information.

**O-P**

**Oblique Light**
Ambient, dedicated, or flash illumination that comes in from the side. Low angle oblique lighting techniques are helpful in bringing out three dimensional details in textured surfaces, e.g. shoe impressions, indented writings, etc.

**Overexposure**
When an exposure receives too much light, causing loss of details in the highlights, or ‘clipping’. Occurs when the exposure time is greater than suggested by the camera’s reflective light meter, or an incident light meter.

**Painting With Light**
A photography technique used to illuminate a large low light scene. This technique is common in motor vehicle accident investigation photography and in large outdoor crime scenes, where a single flash would not provide adequate illumination. The shutter is set to the BULB setting, and the illumination comes from multiple manual bursts of light from an electronic flash unit, or painted in with a dedicated light source like a rechargeable flash light or spot light.

**Panning**
Moving the camera so that the image of a moving object remains in focus and in the same relative position in the viewfinder. A technique used during surveillance photography, or during creative photography to render the appearance of motion in an image.

**Panorama**
A broad view, usually scenic. Can be achieved by stitching multiple exposures together in an image editing software application, e.g. Adobe Photoshop®. Can also be a technique used to document a very wide crime scene, like multiple robberies or burglaries in multiple businesses of a strip mall.

**Parallax**
With a lens-shutter camera, parallax is the difference between what the
viewfinder sees and what the camera records, especially at close distances. This is caused by the separation between the viewfinder and the picture-taking lens. There is no parallax with single-lens-reflex cameras because when you look through the viewfinder, you are viewing the subject through the picture-taking lens.

**Photogrammetry**

The method by which accurate measurements may be extrapolated from photographs. This generally involves the inclusion of a known size perspective grid into an image.

**Pincushion Distortion**

The lens distortion that shows linear elements at the periphery of an image that appear to be bending in to the center of the image. This distortion is most common with certain larger focal length telephoto lenses.

**Pixel**

An abbreviation, or conjunction, of the words Picture Element. It represents the smallest visible element in a digital image.

**PPI (Pixels Per Inch)**

A commonly used unit of measurement that indicates the number of pixels contained in a square inch of space. The more pixels per square inch, the greater the sharpness and resolution.

**Pixelization**

When a digital image is enlarged beyond its resolution settings, the individual square pixels that make up the image become visible. The image looks 'boxy' and lacks smooth gradation or transition between subjects, colors and contrasts.

**Point & Shoot**

A slang term commonly used to identify compact consumer based portable automatic camera systems. These are basic camera systems that generally lack the level of programmability and control of a DSLR camera system. This is the term that is generally used to differentiate between an SLR camera system and a fixed lens automatic camera system.

**Polarizing Filter**

A filter that transmits light traveling in one plane while absorbing light traveling in other planes. When placed on a camera lens or on light sources, it can eliminate undesirable reflections from a subject such as water, glass, or other objects with shiny surfaces. This filter also darkens blue sky. Polarizing filters are helpful during surveillance and crime scene photography, when the subject or evidence is inside the cab of a vehicle and a glare on the windshield prevents proper photography.

**Positive**
The opposite of a negative, an image with the same tonal relationships as those in the original scenes—for example, a finished print or a slide.

**Prime Lens**
Another name for a lens having a fixed focal length.

**Print**
A positive picture, usually on photo paper.

**Processing**
A term commonly used to identify post-capture digital image enhancement. “The image has been processed.”

**Program Exposure**
An exposure mode on an automatic or autofocus camera that automatically sets both the aperture and the shutter speed for proper exposure.

**Q-S**

**Rangefinder**
A device included on many cameras as an aid in auto or manual focusing.

**Reflector**
Any device used to reflect light onto a subject.

**Reciprocity Failure**
Most films are designed to be exposed within a certain range of exposure times—usually between 1/15 second to 1/1000 second. When exposure times fall outside of this range—becoming either significantly longer or shorter—a film's (or sensors) characteristics may change. Loss of effective film speed, contrast changes, and (with color films) color shifts are the three common results. These changes are called reciprocity failure.

**Reciprocity Law**
Many different combinations of shutter speed, aperture, and ISO can be used to acquire the same exposure. Increasing one exposure variable while incrementally decreasing another will generally result in an equivalent (same) exposure.

**Red Eye**
When an electronic flash photograph is taken and the flash unit is close to the axis of the camera lens, light enters the eyes of humans and animals and bounce os off the blood vessels in the eye, resulting in a subject with red eyes.
Methods to correct this include a series of pre-flashes that fire before the actual exposure that cause the pupils of the eye to constrict, reducing the effect. Another method is to position the flash unit so that it is away from the axis of the lens. A final method is to use a bounce flash technique.

**Reflective Light Meter**

The light meter that is built into most point and shoot and SLR camera systems.

**Refraction**

As light moves from one medium to another, it bends.

**Re-sampling**

Changing the resolution of an image either by removing pixels (lowering resolution or compressing the image), or adding them by interpolation (potentially increasing the printable size of an image).

**Resolution**

The capability of a photographic reproduction to distinctly record two separate but adjacent elements of an image. The degree of sharpness of a computer-generated image as measured by the number of dots per linear inch in a hard-copy printout or the number of pixels across and down, or per inch, in a digital image.

**Retouching**

Altering an image after capture by use of photo editing software. Can also be accomplished with conventional silver based photography.

**RGB (Red, Green, Blue)**

The primary colors.

**Ring Flash**

A flash unit that attaches to and encircles a lens to emit light onto all sides of a small object. A soft even light used during close-up photography that produces virtually no shadows.

**S**

**Saturation**

An attribute of perceived color, or the percentage of hue in a color. Saturated colors are called vivid, strong, or deep. Desaturated colors are called dull, weak, or washed out.

**Selective Focus**

Choosing a lens opening that produces a shallow depth of field. Usually this is
used to isolate a subject by causing most other elements in the scene to be blurred.

Shutter
Blades, a curtain, plate, or some other movable cover in a camera that controls the time during which light reaches the film.

Shutter Priority
An exposure mode on an automatic or autofocus camera that lets you select the desired shutter speed; the camera sets the aperture for proper exposure. If you change the shutter speed, or the light level changes, the camera adjusts the aperture automatically.

Shutter Speed
The time the shutter is allowed to remain open to expose the image. This duration is generally expressed in fractions of a second, e.g. 1/60. Shutter speed can also be expressed as whole seconds, e.g. 30" (30 second exposure), or in exposures that extend beyond 30", a BULB setting.

Sidelighting
Light striking the subject from the side relative to the position of the camera; produces shadows and highlights to create modeling on the subject. Also known as oblique lighting, and commonly used during three dimensional subjects, or textured surfaces, to bring out detail.

Single-Lens-Reflex (SLR) Camera
A camera that allows you view the scene through the same lens that takes the picture, and captures accurately what is viewed through the viewfinder. This system incorporates a system of mirrors and prisms to allow the photographer to view the scene through the optical viewfinder. Generally, a camera system that allows the user to interchange lenses based on photographic application.

Slide
A photographic transparency (positive) mounted for projection.

Slow ISOs (Film)
ISOs of 100 or below. Although less sensitive to light, requiring longer exposure times or wider apertures, these low ISOs are capable of producing better quality digital images.

Soft Lighting
Lighting that is low or moderate in contrast, such as on an overcast day.

Spot Metering
A metering mode that only registers the light coming from a very small circle in the center of the focus point. The size of this circle is programmable in many
new digital SLR camera systems. This is the preferred metering mode for very critical exposures, surveillances, and during close-up forensic photography.

**Stopping Down**

Changing the lens aperture to a smaller opening; for example, from f/8 to f/11.

**Synchronization Speed**

When conducting flash photography the photographer should first set the appropriate shutter speed to synchronize with the flash unit. The shutter speed, or range of shutter speeds, that will operate in conjunction with the use of an electronic flash unit. These speeds used to be limited to maximum shutter speeds of about 1/250. New technology allows extremely fast flash synchronization speeds in some advanced digital SLR camera systems.

**Front Curtain Sync:** Dedicated flash units allow the flash to fire immediately after the front curtain has completely opened. This is the default for most flash units.

**Rear Curtain Sync:** Some camera systems, and flash units, can allow the flash to fire just before the rear curtain begins to close. A creative photography option that allows for streaking of moving objects and lights.

**T**

**Telephoto Lens**

A lens that makes a subject appear larger on film than does a normal lens at the same camera-to-subject distance. A telephoto lens has a longer focal length and narrower field of view than a normal lens.

**Teleconverter**

A supplemental lens that integrates between the selected lens and the camera body to increase to focal length of the selected lens. Teleconverters come in a variety of sizes, that will either magnify the focal length by 1.4x or 2.0x. A 2.0x teleconverter is commonly called a ‘doubler’.

**Through-The-Lens Metering**

Meter built into the camera determines exposure for the scene by reading light that passes through the lens during photography.

**TIFF (Tagged Image File Format)**

A lossless or uncompressed image file format. Produces very large file sizes, however preserves image resolution.

**Time Exposure**

A comparatively long exposure made in seconds or minutes. In most cases with
timed exposures the camera is set to the BULB setting, and the shutter speed is controlled manually by the photographer with a remote control.

Tone

The degree of lightness or darkness in any given area of a print; also referred to as value. Cold tones (bluish) and warm tones (reddish) refer to the color of the image in both black-and-white and color photographs.

Transparency

A positive photographic image on film viewed or projected by transmitted light (light shining through film).

Tripod

A three-legged supporting stand used to hold the camera steady. Necessary when using slow shutter speeds and/or large telephoto lenses.

Tungsten Light

Light from regular room lamps and ceiling fixtures, not fluorescent.

U-Z

Underexposure

A condition in which too little light reaches the film, producing a darker than acceptable image.

Unsharp Mask

A tool available in most digital image editing programs, and internally in some camera systems, that will sharpen detail in an image.

USB (Universal Serial Bus)

A data transfer standard.

Viewfinder

The optical opening in a camera system that allows the user to compose, preview, and focus the subject.

Vignetting

A fall-off in brightness at the edges of an image, slide, or print. Can be caused by poor lens design, using a lens hood not matched to the lens, or attaching too many filters to the front of the lens.

White Balance

Digital cameras come equipped with a control that allows the user to calibrate the camera to virtually any lighting environment. Setting the correct white balance
ensures accurate color reproduction, and eliminates inaccurate color casts.

Wide-Angle Lens
A lens that has a shorter focal length and a wider field of view (includes more subject area) than a normal lens.

Zoom Lens
A lens in which you adjust the focal length over a wide range. In effect, this gives you lenses of many focal lengths.

Robinson, Edward M. *Crime Scene Photography (2nd ed.)*. Amsterdam:

CHAPTER TWO: Principles of Photography

CHAPTER DESCRIPTION:
This chapter is designed to identify the fundamental principles of controlling the photographic exposure.

GOAL
Given a photographic assignment, the student will identify the four components of a photographic exposure and apply these in a manner that produces properly exposed images of simulated evidence, subjects and scenes.

PERFORMANCE OBJECTIVES:
1. List the primary photographic formats
2. Identify camera aperture and its influence on the photographic exposure
3. Identify the camera shutter and its influence on the photographic exposure
4. Identify ISO/film speed and its influence on the photographic exposure
5. Identify various types of light, color temperatures, and their influence on the photographic exposure

Introduction
There is probably no better method to illustrate a crime scene or individual pieces of evidence than a well composed, properly exposed, clear, and accurate photograph. The age-old adage of “a picture is worth a thousand words” rings true for thousands of people documenting evidence.

Photography as we knew it has undergone a dramatic evolution during the last decade. With the rapid technological advances, digital photography is not only an emerging and acceptable method of documentation for crime scene professionals; it is fast becoming the preferred method for the vast majority of departments.

Photographic formats
Throughout the evolution of photography various photographic formats have been developed. These formats were typically developed to meet the emerging needs of the professional, amateur, and consumer photographers. Each format has its own niche in
the industry, as well as its own specific applications and level of requisite photographic knowledge necessary operate and or master.

Crime scene photographers should have a basic understanding of the various photographic formats available in the industry, their applications, attributes, advantages and disadvantages.

**SMALL FILM FORMAT** – Until recent years, the most widely utilized and dominant photographic format since its inception in the early 1900's. Small format, also known as 35mm, is referred to as “small format” due to its relatively small film negative size of 7/8” tall by 1 7/16” wide. Albeit a small negative, the 35mm format is still considered the reference standard when comparing the latest and greatest digital camera systems available today. Resolution is commonly measured by the quality of fine detail contained, or retained, within a particular image when it is enlarged.

The maximum print size of the format being used is a genuine concern because of the need for enlargements of evidence for laboratory analysis and photographic court exhibits. As a rule of thumb, a 35mm film negative is capable of producing enlarged prints, of acceptable discerning quality, of sizes up to 11x14. Larger prints can be, and commonly are, produced from small format negatives, but as the size of the print goes up the quality of fine detail goes down.

**Advantages** - Small format films and film processing are readily available, produce high quality prints, and offer considerable latitude for enlargement.

**Disadvantages** - with the wide spread proliferation of digital cameras, certain types of small format films are becoming increasingly difficult to acquire, and many have been discontinued altogether.

**MEDIUM FILM FORMAT** cameras incorporate a film negative significantly larger than that of a 35mm small format camera, however significantly smaller than that of a large format camera, hence the name “medium format”. Much akin to the 35mm camera system, the medium format is typically a handheld, portable camera system that operates functionally similar to the small format system.

The primary functional differences are the size of the film negative, 120 or 220mm, and the way into which film is loaded into the camera, roll film vs. canister film. It is the quality that distinguishes the medium format from the small format camera systems. Printed photographs begin with a film negative. Larger negatives have the potential for larger prints and greater retention of fine detail during printing or enlargement.

**Advantages** - Medium format cameras offer greater latitude for enlargement. The larger film negative results in a higher quality printed photograph at larger sizes, while maintaining a high degree of resolution.

**Disadvantages** - Medium format film is not as “readily” available, and is becoming
increasingly more difficult to find.

Medium format camera equipment (camera bodies and lenses) are more expensive and generally require more technical skill to operate than small format cameras.

**LARGE FORMAT** cameras are in a category all their own, and for good reason. As mentioned earlier, large format cameras have a significantly larger film negative than do small and medium format camera systems. This larger film negative, 4” x 8” or 8” x 10” sheet film, translates to the highest quality images with the greatest latitude for enlargement of any of the photographic formats. Large format print enlargements are possible at sizes greater than 30” x 40”. This enlargement potential is often times necessary during forensic laboratory analysis of microscopic detail present in various types of evidence collected in the field.

**Advantages** - Large format cameras offer the highest quality (resolution) prints of any photographic format available. This is especially useful during photography of evidence intended for forensic analysis and comparison.

Large format film offers the highest degree of latitude for enlargements, which may be especially useful for large courtroom exhibits.

**Disadvantages** - Large format camera systems are very expensive to outfit, and are very slow in terms of film advance due to the manual loading of sheet film for each frame.

Large format camera systems require a great deal more requisite photographic knowledge than do the other formats and are typically impractical for field use due to their size and method in which they function.

Their impracticality, technical learning curve, and cost are probably why the majority of these types of cameras are found in a laboratory or fixed studio applications.

**INSTANT PRINT** cameras are “almost” just that, instant. With virtually a mini film processing lab built into every sheet of film, the “Polaroid” company in conjunction with Edward Land introduced the Polaroid Land Camera Model 95 to the public in 1948. Many models have been released since then, and many formats. From 3 ¼” x 4 ¼” to 20” x 24”, the Polaroid company developed various size instant films for various applications. The magic of instant cameras is in the film pack.

The instant film pack contains all of the necessary chemicals for developing the exposed film, which automatically begins seconds after a photograph has been taken.

**Advantages** - The primary advantage to instant cameras is the immediacy in which the user can confirm that a successful image has been obtained. This feature is one of the primary reasons that instant cameras became so popular with the law enforcement community, and believe it or not are still being used by
some agencies during general crime scene and evidence photography.

**Disadvantages** - The quality of images produced with an automatic exposure instant print camera are often times not acceptable. Although high resolution instant print images are possible with special application large format instant cameras, this is not the type available to the officers and investigators in the field. Another drawback to these types of cameras is that they are limited in respect to manual control over exposure. Additionally, it has become increasingly difficult to find film since 2009, when the Polaroid Company ceased manufacture and went out of business.

**DIGITAL** - Since its debut in the early 1990’s, digital photography has globally evolved to become the dominant photographic format in the consumer market. From kindergarten children to professional portrait photographers and photo journalists, digital photography is currently emerging as the most widely accepted and preferred of the photographic formats.

As the quality of digital photography increases the price decreases, at astonishingly exponential rates. Conventional film cameras focus reflected light on gelatin film with silver halide crystals imbedded in an emulsion. A digital camera has a sensor, or digital semiconductor, that converts focused reflected light into electrical charges, or electrons. This semiconductor, commonly either a CCD (charged coupled device), or CMOS (complementary metal oxide semiconductor), then records this reflected light electronically.

**Advantages** - Digital photography has a multitude of advantages for the civilian and law enforcement photographer:

The ability to instantaneously acquire and confirm an evidentiary photograph is probably the most valuable attribute associated with digital imaging.

Being able to record several hundred images on a stable and removable media card is also an advantage.

The cost factor associated with digital photography is another advantage that cannot be overlooked, especially in the law enforcement arena.

Digital images can be stored on a stable media indefinitely. Not until a case comes up for a court proceeding does one need to print. And, only selected images need be printed, reducing waste associated with printing entire rolls of film.

**Disadvantages** - Many digital camera systems are completely electronic devices that cannot function without battery power. Some have a combination of electronic and mechanical functions, but all require battery power to operate. This is a disadvantage when compared to many manually operated 35mm film cameras, which can function without the aid of a battery.

Resolution is another debatable disadvantage for many digital camera systems. Until recently, small format film quality exceeded that of any digital camera on the
market (some research in this area suggests that it would take a digital camera with a sensor resolution of approximately 22 megapixels to match the quality of a small format film negative). However, there are currently several affordable camera models on the market that meet or exceed this resolution.

Image integrity and the ability to quickly and easily edit, manipulate, enhance, or otherwise modify a digital image is another issue that tends to raise the brow of many legal professionals. Although image integrity is a potential issue, a specific set of recommendations are in place that help to ensure image integrity and limit the potential for debate or evidentiary exclusion (SWGIT Guidelines).

Camera aperture and its influence on photographic exposure

APERTURE is defined as the physical opening, or hole, in an optical instrument that allows a specific volume of light to pass through. In SLR, this means photography that relates directly to the camera’s lens. Aperture is also referred to as a diaphragm, which is formed by a series of six or more overlapping metal blades within the lens that can be adjusted to create a smaller or larger opening.

The actual size of the lens opening is identified with an \( f \) stop value, i.e. \( f \) 1.4, \( f \) 2.8, \( f \) 4, \( f \) 5.6, \( f \) 8, \( f \) 16, \( f \) 22:

- The larger the lens opening, a smaller \( f \) stop number, the more light allowed to pass through.
- The smaller the opening, a larger \( f \) stop number, the less light allowed to pass through.

Each “full stop” incremental change in aperture either allows twice the amount of light in, a doubling effect, or half the amount of light in, a halving effect from the previous setting.

Aperture, \( f \) stop, and diaphragm are all terms used interchangeably in photography, however relate to the photographer’s ability to control light and exposure by manipulating or adjusting the volume of light allowed to pass through a lens. While aperture controls the volume of light reaching the camera’s digital sensor, or film in the case of a film camera, it also controls depth of field.

DEPTH OF FIELD is defined as the area of acceptable sharpness in front of and behind the subject of focus in an image. Although there is only one “true” point of focus in any image, varying levels of focus can be controlled by the photographer through the manipulation of three variables:

1. Depth of field is primarily influenced by the opening in the diaphragm of the lens, or aperture. Smaller \( f \) stop numbers (\( f \) 1.4, \( f \) 2.8, \( f \) 4), larger apertures, result in
shallow, or limited, depths of field. Larger f stop numbers (f 11, f 16, f 22), smaller apertures, result in increased depths of field. In practical terms, larger lens openings result in less apparent focus extending outward in both directions from the focused subject, whereas smaller lens openings result in greater apparent focus extending outward (from foreground to background) from the focused subject.

2. Another variable that influences depth of field in an image is the focal length of the lens. Shorter focal length (wide angle) lenses i.e. 24mm, 50mm, tend to produce images with greater depths of field. Fixed and telephoto lenses with large focal lengths i.e. 300mm, 500mm, 800mm, exhibit shallower depths of field.

3. Lens to subject distance is another variable that influences depth of field. The closer the lens is to the focused subject, the shallower the depth of field. This is why that during close-up (macro or micro) evidentiary photography depths of field are so critical when photographing evidence on concave or convex surfaces. Smaller apertures are preferred (i.e. f 16-f 22) during close-up photography of evidence in order to maintain acceptable focus in the desired areas of the image.

Aperture is also a method to control an exposure. The term exposure can have a variety of meanings, but in this context it is the amount of light striking the film or digital sensor. Larger apertures allow more reflected light to come through the lens; smaller apertures allow less light through.

Aperture allows for users to regulate the volume of light streaming through the lens in a given lighting environment. In low light environments, larger apertures are much more effective at gathering what little light there is so that an image can be obtained. Conversely, photography in a bright sunny white beach environment forces the photographer to “stop down” the lens so that their images are not over exposed.

Lens aperture is also a method of determining how “fast” a given lens is. When the term “fast” is used in conjunction with lens aperture, it implies a lens with a very wide open available aperture, a low f stop number, i.e. f 1.4, f 1.8, or f 2.8. Lenses with larger apertures, known as efficient lenses, allow for photography at faster shutter speeds in lower light environments.

UNDERSTANDING THE ‘F’ IN “F-STOP” - The term f/stop is a fraction that identifies the actual measured size of the opening, or diameter, of the lens diaphragm of a particular focal length lens. The following example illustrates the fraction: 50mm lens @ f 1.4=50/1.4=35.7mm opening, compared to 50mm lens @ f 22=50/22=2.27mm (very small when compared to the diameter @ f 1.4). This begins to make sense of the often times confusing inverse relationship between f stop numbers and volume of light.

Camera shutter speed and its influence on photographic exposure
If the aperture of a lens controls the volume of reflected light reaching the film or digital sensor, then the camera shutter controls the duration of the volume of light that is set by the aperture.

Single Lens Reflex camera systems are equipped with what is referred to as a focal plane shutter. The focal plane shutter is located in the back of the camera body, just in front of the film. It is called a "focal plane" shutter because it is situated at the location in the camera body where the light allowed to travel through the lens is brought into focus. When the shutter release is depressed, whether it is a mechanical or electronic camera, the focal plane shutter opens and allows light through to strike the film or digital sensor for a pre-determined amount of time. This pre-determined amount of time, shutter speed, is the length of time the shutter remains open to create the image.

- Shutter speeds are measured in fractions of a second, whole seconds, or in some instances minutes.
- Shutter speeds influence the photographic exposure by either controlling exposure or controlling motion.

Aperture controls the volume of light reaching the film or sensor.

Camera shutter controls the duration of that volume of light that is set by the aperture.

The function of the shutter mechanism is to admit the light that passed through the aperture into the camera and onto film or digital sensor for a specific amount of time. Longer (slower) shutter speeds in any lighted environment will allow more light to influence, or expose, the film. Longer shutter speeds are especially helpful in low light situations when an auxiliary flash unit is not being used. Conversely, faster shutter speeds allow less light through, and are helpful in bright sunny daylight conditions.

The camera shutter is also the mechanism used for synchronization with an auxiliary flash unit. A certain range of shutter speeds must be used during flash photography; these are referred to as flash synchronization speeds. The shutter speeds conducive for flash photography typically range from 1/60-1/500th of a second. These identify the exact moment when the shutter curtain is completely opened and the flash fires to properly illuminate the subject or scene.

Another aspect of the photographic exposure that is influenced by the camera shutter is its ability to control motion. How fast the shutter has to open and close to control motion depends entirely upon the speed in which the subject is moving.

- Faster moving subjects, i.e. a racecar or fast moving motorcycle, require faster shutter speeds.
- Slower moving subjects, i.e. running, walking, or stationary human beings, require slower shutter speeds.

One other factor that must be considered when selecting the “correct” motion stopping shutter speed is the direction in which the moving subject is traveling:

- Perpendicular and angular motion requires faster shutter speeds.
- Travel in the direction towards or from the photographer may be controlled
Generally speaking, the only time moving subjects will be a concern for FSD crime scene photography is when aerial photography of a scene is requested.

**When photographing from a moving platform**, i.e. vehicle, boat or aircraft, shutter speeds of 1/500th sec. or faster should be used in order to control your motion, as well as the motion of your subject.

**Camera shake**, or the uncomplimentary blur that is often times recorded in an image during handheld photography, can also be controlled through use of faster shutter speeds. As a general rule, shutter speeds greater (faster) than 1/60th are recommended for handheld photography. For those shots that the ambient lighting conditions force the shutter slower than 1/60th, a tripod should probably be used to retain crisp non-moving subject detail.

Creative photographers often times incorporate various photographic techniques along with **slower shutter speeds** to intentionally “suggest” motion within a photograph. Slower shutter speeds are useful for law enforcement personnel during lower light photography of stationary scenes and subjects, or when photographing objects using depth of field enhancing apertures that restrict the volume of light. This type of photography requires the use of a tripod to ensure crisp detail where it counts.

### ISO/film speed and its influence on photographic exposure

Another aspect that controls photographic exposure is the sensitivity to light of the media in which the captured image is recorded. This sensitivity to light is referred to as film speed, or **ISO** (International Organization for Standardization), and is also identified as the **exposure index**.

In film photography, various sized silver halide crystals are embedded in the emulsion of the gelatin film. These crystals are responsible for the chemical reaction in the film that creates the image when the film is exposed to reflected light.

- Larger, loosely compacted silver halide crystals respond faster to light, and can create a properly exposed image with less time.
- Smaller, tightly packed silver crystals respond slower to light, and take more time

**NOTE:** The latitude to photograph at faster shutter speeds is dependent upon the amount of available or auxiliary light, size of lens aperture, and film speed (ISO). Dimly lit environments will require longer exposure times (shutter speeds) to make a photograph. Longer exposure times will not control (stop) motion, i.e. 1/30th, 1/15th, 1/8th …, and will require a tripod.
to create a properly exposed image.

The concept and standardization of film speed has been universally applied to digital photography as well. The advantage with film speed and digital photography is that it can be changed from shot to shot, depending on the photographer’s objective and available lighting conditions.

Film speeds range from about 6 on the slowest end of the exposure index, up to 12,800 on the fastest end of the index. Slower speed films exhibit less granular structure, or “film grain”, when printed in comparison to fast films which tend to exhibit an obvious granular structure when printed.

- Film speeds up to about ISO 100 are considered “slow” films.
- Film speeds beginning at around ISO 400 are considered “fast” films.

There are certain advantages and disadvantages associated with using very slow or very fast films. Very slow films will produce exceptional prints with very little or no visible “film grain”, however must be used in well lighted environments, with slower shutter speeds, or with an auxiliary flash unit. Very fast films produce obvious film grain that can degrade the quality of the print, however can be used in lower lighting environments with faster shutter speeds. “Average” speed films that will produce good quality prints with an acceptable level of grain in a variety of lighting environments are around ISO 400.

### Various types of light and color temperatures and their influence on photographic exposure

**LIGHT** is one of three essential ingredients that must be present in order to make a photograph. Without light, photography would be impossible to make. Light comes in various forms, from a variety of sources, and varies significantly in its quality and characteristics. A better understanding of the influence of light on your photographs, and how to better control or manage it is a very important component of the photographic process that the photographer needs to understand.

1. The most common light source the photographer encounters is **natural sunlight**. Our sun emits a host of energies which form the Electromagnetic Spectrum. Within this spectrum is a small range of specific energies that humans are able to see, this small range of energy is referred to as visible light. The range of “visible” energy that we can see is measured in nanometers (nu), and includes the primary colors of
red, green, and blue (400-700 nu).

2. On the lower end of the electromagnetic spectrum is ultraviolet (UV) energy, the energy that cooks your skin when exposed too long without “UV protection”. Although we cannot see UV energy with the unaided eye, we certainly know it is there after a long day in the sun.

3. On the higher end of the spectrum is infrared (IR) energy. IR isn’t visible without the aid of special equipment, but we know it is there because we use it as part of our everyday activities and it is often helpful in certain special photographic assignments.

All other forms of light that illuminate our world, or that are used in photography, are generated from manmade sources. These sources include house lamps, street lamps, car lamps, flash lights, flood lamps, candles, and electronic or bulb originated photographic flash units. Many of these are used specifically in photography, and are developed in such a fashion that they mimic the characteristics of natural sunlight.

The qualities of the various forms of light exhibit certain color temperatures. Color temperature is a characteristic of visible light that has important applications in photography and video. Color temperatures significantly influence the photograph and are measured on a scale known as the Kelvin Temperature Scale. Common photographic lighting sources include, but are not limited to, daylight (at various stages), incandescent, fluorescent, flash, and studio lamps or photo floods. All of the aforementioned lighting sources exhibit differing color temperatures, and must be properly addressed in order to reproduce accurate color in a photograph.

In film photography color temperature issues are corrected with specific film types that are “color balanced” to a particular light source, i.e., daylight balanced films, vs. tungsten balanced films etc. When the type of film and color temperature doesn’t match, the images will contain a color cast that ranges from yellow/orange to blue/gray, depending on the environment.

In digital photography color balance can be adjusted from shot to shot by adjusting the camera’s white balance setting. Today’s digital cameras are very versatile and contain a wide assortment of color balances to choose from. The following chart illustrates some examples of common lighting sources and their associated color temperatures in degrees Kelvin.

</tbody>
</table>

Methods used to **correct color balance** include colored lens filters, gel flash filters, and filters that can be placed over lights.

**Electronic flash units** are typically calibrated at about 5000 K, which is about the same as average daylight. This allows for accurate color reproduction during flash photography using daylight calibrated films.

Most of today’s **digital cameras** are equipped with an “Auto” white balance (AWB) setting. This setting will not work properly in incandescent environments because it is outside of the range of color temperatures.

**Chapter Review**

The **primary photographic formats**: Small (35mm film), Medium (120-220 medium format roll film), Large (4x5 or 8x10 sheet film), Instant, and Digital. Large format film cameras are capable of producing the highest quality prints of any of the current formats, although digital sensors have made rapid advancements in recent years.

Camera aperture is the physical opening in the camera lens that allows a certain amount of light to pass through the lens and onto the film or digital sensor. Aperture is also known as diaphragm, and consists of six overlapping metal blades that can be adjusted to various sizes, known as *f stops*. Each “full stop” adjustment in aperture allows either twice as much or half as much light to pass through the lens. Aperture also controls depth of field, or the area of acceptable sharpness in a photograph.

Camera shutter is the mechanism that opens and closes to allow a specified amount of light to reach the film or digital sensor. The shutter in SLR camera systems is known as a focal plane shutter. Shutter speeds are also referred to as “stops”, and each full “stop” incremental change will either allow twice as much or half as much light expose the film or digital sensor. Shutter speed also controls motion. Fast shutter speeds stop action and slow shutter speeds suggest motion in an image.

ISO (International Organization for Standardization) is a global standard established for the sensitivity of film, or image sensors in the case of digital photography, to light. *Film sensitivity is also known as “film speed”*. Slower films, or ISO’s, offer exceptional quality images however take longer periods of time to properly expose. Faster films will expose faster in a given lighting environment however will exhibit grain, or “noise” which
can compromise image quality or resolution.

Light is a necessary ingredient of the photographic exposure. Without light photography would be impossible to make. Visible light is that small range of light that includes the primary colors of red, green and blue. Visible light ranges from about 400-700nm. **Below visible spectrum is infrared energy** and **above the visible spectrum is ultraviolet energy**. In law enforcement photography accuracy is very important. Accurate colors are reproduced by photographing with films and white balances that match the same color temperatures in the environment that the photography is being conducted. These color temperatures are measured in degrees Kelvin and common environments range from about 2,000 K to over 10,000 K. Photographing with incorrect films or white balances produces prints and images that reflect color casts which range from yellow/orange to blue/gray, depending on the environment.
CHAPTER THREE: Controlling Depth of Field & Motion Blur

CHAPTER DESCRIPTION:
This chapter is designed to introduce the student to the photographic concepts and methods associated with controlling depth of field and motion blur (camera shake).

GOAL:
Given a photographic objective associated with controlling depth of field or motion blur (camera shake), the student will make a properly exposed photograph of a simulated item of evidence that would be acceptable for analysis or identification.

PERFORMANCE OBJECTIVES:
1. Identify depth of field, and the primary factors that influence acceptable sharpness in a photograph
2. Identify the function of the camera’s shutter and the influence that shutter speeds have on controlling motion blur in a photograph

INTRODUCTION
In crime scene or close-up evidence photography, a primary objective is to control depth of field to the extent that all relevant information and detail are rendered in clear crisp focus to aid in later analysis or courtroom exhibits.

Primary Factors That Influence Acceptable Sharpness in a Photograph

Depth of Field (DOF): Refers to the amount of distance between the nearest and farthest objects that appear in acceptably sharp focus in a photograph. There are three primary factors that influence the level of depth of field within an image:
Aperature (f-stop): Size of an opening in a camera lens through which light passes to expose the film, or create the image on a digital chip or semi-conductor in the case with a digital camera.

The size of aperture is usually calibrated in f-numbers (“f-stop”), or fractions. Larger f-numbers relate to smaller apertures and smaller f-numbers are associated with larger apertures. The size of the aperture of a lens is controlled by the lens diaphragm, commonly six overlapping metal leaves that can be adjusted to regulate the amount of light allowed through.

STANDARD APERTURES - standard apertures include f1.4, f2.8, f4, f5.6, f8, f11, f16, f22. Many cameras will allow the user to select ½ or 1/3 stop settings, in addition to standard full stop incremental changes in aperture. Each full stop incremental change in aperture either doubles or halves the amount of light allowed to pass through the lens from the previous setting.

SMALL APERTURES - Smaller apertures which restrict the light streaming through a camera lens produce images with greater depths of field.
LARGE APERTURES - Larger apertures, which allow greater amounts of light to stream through the lens, produce images with shallow or reduced depths of field.

CIRCLE OF CONFUSION - When light reflects off of an object, it is reflecting in all different directions. When a camera lens is pointed toward an object it gathers the reflected light. This reflected and gathered light is brought into focus by adjusting the distance between the lens and the film or sensor plane, usually with the focus ring on a lens. It is at this plane that all of the gathered reflected light converges into a point of focus. There is only one true point of focus in any image. The areas within an image in which reflected light is not brought into exact convergence will be rendered visually out of focus, these out of focus areas are known as circles of confusion. The larger the lens opening (aperture), the larger the circles of confusion and the less apparent focus from near to far within an image.

When reflected light from varying distances (lens to subject distances) is restricted to streaming through a smaller lens aperture prior to striking the film or sensor plane, the circles of confusion are smaller and less noticeable under normal viewing conditions. Although the areas may still be slightly out of focus, they are rendered in what appears to be focus to the unaided eye. This is the reason that smaller apertures produce images with greater depths of field.

Focal Length of Lens

Another factor influencing the depth of field in an image is the focal length of a lens. Shorter lenses produce greater depths of field than do longer lenses at similar f-stops. This may be related to the difference in distances from lens to
subject when using longer lenses, but as a rule of thumb the longer the focal length of the lens, the less apparent depth of field.

**Distance from Lens to the Subject**

The final factor influencing depth of field in an image is the distance between focal plane (film or sensor plane), and the subject being photographed. As a general rule, the closer the lens is to a subject the less available depth of field. In normal photography, depth of field is typically distributed about one third before (foreground) a subject, and two thirds beyond (background) a subject. In close-up or macro photography, depth of field is extremely critical, being distributed about one fourth in front of and one half beyond the focused subject. This is why smaller apertures are necessary when doing close-up photography of evidence, especially on concave or convex surfaces.

**The Function of the Camera’s Shutter and the Influence Shutter Speeds Have on Controlling Motion in a Photograph**

The aperture designates by size (f-stop) the volume of light allowed to stream through the lens and strike the film, or sensor. The shutter, however, is the mechanism that allows the volume of light set by the aperture to pass through the camera body and actually reach the film or sensor for a specific length of time. The shutter is the barrier between the lens and the film that prohibits light to pass until opened by the photographer. The duration that the shutter remains open before closing is known as a shutter speed. Shutter speeds are measured in fractions of a second, whole seconds, or even minutes. Whereas a dominant feature of aperture is controlling the depth of field within an image, shutter speed
controls another important aspect of photography, motion.

**SHUTTER SPEEDS** - Shutter speeds are expressed in fractions of a second, full seconds, and even minutes. Shutter speeds are reflected on a camera dial and in LCD's as full numbers. Full second settings in shutter speed are expressed with a ” next to the number, indicating full second exposures. Shutter speeds, like apertures, are also referred to as stops. Many of today’s cameras will allow the user to select from 1/2 or 1/3rd stop changes in shutter speeds. The standard full stop changes in shutter speed are: 30", 15", 8", 4", 2", 1", ½, ¼, 1/8th, 1/15th, 1/30th, 1/60th, 1/125th, 1/250th, 1/500th, 1/1000th, 1/2000th, 1/4000th, 1/8000th, 1/16000th.

Each full stop incremental change in shutter speed either doubles or halves the duration and amount of light reaching the film or sensor. The camera shutter can also be controlled manually for an indefinite amount of time in the “Bulb” setting, which is useful for exposures that are longer than 30 seconds.

**BULB** - the B, or Bulb, setting for the camera’s shutter relates back to early photography when the shutter could be controlled by a rubber bulb that when squeezed would force air through a tube to open the shutter until the pressure was released. Today the Bulb setting still exists, however it is typically controlled by an electronic shutter release cable (MC-30), an IR remote control, or maybe a plunger type configuration that threads into the actual shutter release button. This setting will be used during the painting with light segment of this training program.

**CONTROLLING MOTION BLUR (CAMERA SHAKE)** - Another factor that must be controlled in order to ensure crisp focus within an image is not only the motion of the subject in front of the camera but the movement of the subject behind the camera, the photographer. Camera shake at slower shutter speeds is commonly the predominant culprit responsible for a blurry, out of focus photograph. This is the reason why stability is essential during handheld photography. As a general rule, photography without the aid of a tripod or stabilization device (handheld photography) should not be done at shutter speeds lower than 1/60th of a second. Many camera companies tout their vibration reduction technology that can be integrated into the lens or camera body. This type of technology is not just a sales gimmick; it does work and can allow the photographer to obtain good results when photographing in diminished lighting conditions. Another important aspect that influences camera shake is the focal length of the lens being used. As a
general rule, in an attempt to control camera shake, a photographer should select a shutter speed that is at least equivalent to, or one stop faster than, the focal length of the selected lens during handheld photography, i.e. 400mm lens = 1/400\(^{th}\) - 1/800\(^{th}\) of a second shutter speed, lighting permitting.

**Chapter Review**

Depth of field (DOF) refers to the amount of distance between the nearest and farthest objects that appear in acceptably sharp focus in a photograph. There are three primary factors that influence the level of depth of field within an image: aperture, focal length, and lens-to-subject distance. Smaller apertures allow less light to pass through a camera lens, however increase the depth of field in a photograph by constricting the circles of confusion. Longer focal length lenses typically produce images with shallower depths of field. The closer a lens is to an object the shallower the depth of field. Depth of field in normal photography is typically characterized by being distributed 1/3\(^{rd}\) in front of the subject (the foreground) and 2/3\(^{rd}\) beyond (the background). Close-up or macro photography distributes depth of field ¼ in front and ½ beyond the subject, creating a very shallow depth of field situation. *This is why small apertures and a tripod are usually necessary in order to achieve acceptable depths of field for items of evidence photographed on concave or convex surfaces.*

The shutter is the mechanism that allows the volume of light set by the aperture to pass through the camera body and actually reach the film or sensor for a specific length of time. The shutter is the barrier between the lens and the film that prohibits light to pass until opened by the photographer. The duration that the shutter remains open before closing is known as a shutter speed. Shutter speeds are measured in fractions of a second, whole seconds, or even minutes. Shutter speed is the mechanism used to control motion within an image. Handheld photography should generally not be done using shutter speeds lower than 1/60\(^{th}\) of a second.
CHAPTER FOUR: Introduction to the Digital SLR Camera System

CHAPTER DESCRIPTION:
This chapter is designed to introduce the law enforcement student to the single lens reflex (SLR) digital camera system and auxiliary flash unit. During this block of instruction the camera and flash nomenclature will be identified, along with the various manual and pre-programmed modes and recommendations for operation. Also discussed during this block of instruction are methods for remote control operation of both camera and flash and proper installation of the camera system onto a portable tripod.

GOAL:
Given a digital SLR camera system, tripod, auxiliary flash unit and various lenses, the student will select the proper equipment and camera settings necessary in making properly exposed digital images that could be used as evidence in a court of law.

PERFORMANCE OBJECTIVES:
1. Identify the nomenclature of the Canon EOS SLR camera system
2. Identify the nomenclature of the Canon Speedlite electronic flash unit
3. List the various digital imaging file formats
4. Identify the function and operation of a fixed focal length standard camera lens, telephoto lens, and macro lens
5. List the various photographic shooting platforms available to the photographer

Chapter Introduction
In order to effectively conduct photography, the crime scene photographer must have a solid understanding of the controls and functions of a manual SLR camera system, various interchangeable lenses, the auxiliary flash unit, and a tripod. The dozens of buttons and hundreds of menu options in today’s digital SLR camera and flash systems are often overwhelming and intimidating to the beginning photographer. A comprehensive overview of the camera and flash nomenclature will provide a solid foundation in which the crime scene photographer can build on.
Nomenclature of the Canon EOS Digital
SLR Camera System

CURRENT CAMERA SPECIFICATIONS - The current camera in use by the CCCSO FSD is the Canon EOS digital SLR camera system. Although there are several different generations of this camera system currently in use by the FSD, they all share the same basic controls:
Some key specifications:

a. 8.2 million to 15.1 million effective pixels (8.2 to 15.1 megapixel)

b. ISO sensitivity from 100 to 3200

c. CompactFlash (CF) Card media for image storage

d. RAW and JPEG file formats (Small, Medium & Large selection in JPEG)

e. White balance settings (WB) of Auto, Sunlight, Shade, Cloudy, Incandescent, Fluorescent, Pre, and Degrees Kelvin

f. Picture angle approx. 1.6 times lens focal length, due to APS-C sensor format (multiply lens focal length by 1.6 for effective focal length using this sensor)

g. Built-in auto focus servo in the camera body

h. 4 Auto Focus Area Mode Selections: Single Area, Dynamic Area, Group Dynamic Area, Dynamic Area with Closest Subject Priority

i. 3 Metering Modes:
   - 3D Color Matrix Metering II (1,005 segmented metering),
   - Center-Weighted Metering (weight of 75% given to 6, 8, 10, or 13mm diameter circle in center of frame, or
   - Spot Metering (metering a 3mm diameter circle, approximately 2.0% of frame) centered on active focus area

j. +/- 5 stops of Exposure Value Compensation (EV) in 1/3, ½, or full stop increments

k. Manual, Aperture Priority, Shutter Priority, and Programmed Automatic Exposure Modes

l. Shooting modes of Single Frame (S), Continuous 3fps, Delayed Self timer mode and Quick Response Remote

m. Electronic vertical travel focal plane shutter with speeds from 30 to 1/8000 of a second in 1/3, ½ or 1 full stop increments, and Bulb setting

**CAMERA SET-UP**

In order to prevent unnecessary camera sensor contamination or potential damage, the user should ensure that either a camera body cap, or lens, is installed on the camera at all times.

Every time before a lens exchange or media card exchange is performed, the camera should be POWERED DOWN. This reduces the risk of sucking unwanted dust and debris into the camera body though positive electrical charge, or CF card corruption.
Additional recommendations for lens exchange in non-camera friendly environments, windy or dusty environments, include:

1. Power down the camera prior to exchange
2. Have backup lens ready to install before removing the previous lens or body cap
3. Point camera body downward during the exchange, or hold it against one’s body (provided is wearing a clean, lint free shirt or jacket) until the other lens or body cap can be re-installed.

**NOTE** – Have a lens or body cap installed on the camera at all times. Storing or transporting a digital SLR camera without a lens or body cap installed will result in a dirty imaging sensor which will result in poor quality images, or images that contain artifacts. If this happens, most camera manufacturers recommend sending the camera back to a certified repair facility for sensor cleaning.

**INSTALL SELECTED LENS ON THE CAMERA BODY** - Align the red dot (mounting index) on the camera body with the mounting index on the camera lens. All compatible lenses will have a reference, or mounting index, that makes a lens exchange a simple, quick, and damage free process. The index on the lenses may vary in color and shape. Canon L series lenses have a corresponding red index dot. These indexes are situated at the base of the camera lens, where it would interface with the camera body.

**INSTALL THE BATTERY** - Most of the batteries in today’s digital SLR cameras are rechargeable. When a battery sits on a charger for an extended periods of time it will drain. Although the battery charger may indicate a full charge, batteries that sit for extended periods of time should be recharged prior to going to a crime scene. One good method of checking battery life is by placing the battery in the camera, turning the camera on, and check the battery life in the camera’s menu or with the camera’s battery life meter. After confirming that the camera is turned off, open the battery chamber cover on the bottom of the camera and insert the battery (metal battery terminals facing into the camera body as it is inserted).

**INSTALL THE CF CARD** - After confirming that the camera is turned off, open the CF card door, located on the side of the handgrip. Once it is open, insert the card with the graphics and writing towards you. To remove the card, open CF card door and depress the gray ejector button, located immediately below the card.

**LOCATE THE POWER SWITCH** - The ON/OFF switch is located either near the middle bottom of the camera back or on the upper left, behind the Quick Control Dial.

**FORMAT THE MEMORY CARD** - After the card is properly installed in the camera body, it should be formatted (all images erased). Push the MENU button on the back of the camera and select the Setup Menu (wrench icon). Select Format and press OK, Select YES then OK to begin format process. Verify Format was successful by selecting Playback and message should indicate No image.
ADJUST THE DIOPTER - Vision is an important aspect of achieving sharp focus in photography. Many individuals will have varying degrees of vision, and the adjustment for this on your camera is known as the diopter. The diopter on this particular camera is located to the right of the viewfinder, a small wheel.

When making a diopter adjustment, the user should rotate the diopter wheel until the focus brackets in the viewfinder are rendered sharp, not the scene itself. The diopter adjustment does not focus an image, and has no influence on image focus when using an auto focus mode. The diopter simply adjusts the viewfinder according to an individual's vision.

LOCATE THE COMMAND DIALS - The Canon EOS cameras have a rear command dial. The rear command dial is used to select and control multiple camera commands, controls, and exposure functions when used in conjunction with other buttons.

LOCATE THE SHUTTER RELEASE BUTTON - The shutter release is the proverbial trigger for a camera. Depressing the shutter release completely will open the camera's focal plane shutter allowing light to stream though the lens and onto the camera's sensor, thus creating the image. The Canon EOS is equipped with a “two-stage” shutter release button. When the shutter release is depressed half way it will “wake the camera up” when it has gone into sleep mode, will activate and display important metering information, and focus when in an auto-focus mode. To take full advantage of the two-stage shutter release, the user should compose their shot, depress the shutter release halfway down and access the information before proceeding. When auto-focusing, the camera can give an audible signal when focus is achieved (unless disabled in the Custom Settings Menu). After the focus confirmation is acknowledged, the user should gently push the shutter the remainder of the way down to take the exposure.

LOCATE THE CAMERA METER ANALOG EXPOSURE DISPLAY- When composing a shot or previewing a scene through the camera’s viewfinder, the camera’s reflective light meter display will illuminate when activated by a partial depress of the camera’s shutter release button. The display is situated in the center bottom of the screen when looking through the viewfinder, and looks like a series of dashes with a minus sign on the left, a zero in the center, and a plus sign to the right ( - ------ 0 ------ +). The camera’s meter is the tool that takes the guesswork out of achieving the “correct” exposure during photography. A “correct” exposure is indicated when the camera’s meter is at the center 0 mark. Biasing the meter towards the + will result in an overexposed image and towards the – will result in an underexposed image. Obtaining a properly metered/exposed image is achieved by manipulating the main and sub-command dials which control aperture or shutter speed, or by making an adjustment in the ISO.
Locate and Select a Metering Mode – There are four distinct modes to select from when metering (evaluating) a scene. Evaluative metering, Partial metering, Spot metering, and center-weighted average metering. Metering (weight of 75% given to 6, 8, 10, or 13mm diameter circle in center of frame, or Spot Metering (metering a 3mm diameter circle, approximately 2.0% of frame) centered on active focus area. Depending on how critical the user wants to meter a scene will dictate the metering mode to be selected. The three metering options can be selected by rotating the Metering Selector, which is located just to the right of the viewfinder.

Select an Exposure Mode - The user should select the appropriate shooting mode. The Nikon D3100 comes equipped with 4 shooting modes (Programmed Automatic, Aperture Priority, Shutter Priority and Manual). These modes are represented by a P,A,S,M on the mode dial on the top of the camera body. To select a mode, rotate the mode dial until the desired mode is selected.

Program Mode - “P” In this mode the camera automatically adjusts shutter speed and aperture according to a built in program for “correct” exposures in most situations. This mode is recommended for quick easy shooting in optimal lighting conditions. HI or LO will be displayed in the control panel and viewfinder to indicate over or underexposure when the user attempts photography in lighting conditions outside of the limits of an “acceptable” exposure. Modifications to exposure in this mode can be achieved through use EV (Exposure Value ±) compensation.

Shutter Priority Mode - “S” In this mode the user selects a shutter speed according to their objective. After making a shutter speed selection, the camera will automatically set an aperture based on the scene to achieve a “correct” exposure. This mode is useful when the photographer’s objective is controlling motion. Shutter speeds from 30 seconds to 1/4000 can be achieved by rotating the rear command dial.

Aperture Priority Mode - “A” In this mode the user selects an aperture according to their desired “depth of field” needs and the camera sets a corresponding shutter speed based on the amount of light in a scene to provide a “correct” exposure. This mode is useful when the camera user is primarily concerned with controlling the amount of apparent focus from foreground to background within an image. Small apertures, large aperture numbers, will result in less light streaming through the camera lens but a greater depth of field. Large apertures, small aperture numbers, will result in more light streaming through the lens but a more shallow depth of field. Large apertures are also useful during lower light photography and to maximize the effective range of a camera’s flash or speed light. Aperture settings are obtained by rotating the rear command dial and the range is dictated by the specific lens in use.

Manual Mode - “M” In this mode the user has complete control over exposure by having the ability to select both aperture and shutter speed according to their desired exposure,
or task at hand. This is an especially useful mode to master during evidentiary photography or in general photography. Through use of this mode the user will develop a stronger fundamental understanding of controlling motion, depth of field, and exposure manually. This becomes necessary when photographing difficult scenes, highly reflective objects, or when utilizing a specialized photographic technique i.e., painting with light. When using this mode the user will achieve a “correct” exposure by concentrating on obtaining a “0” in the camera’s meter by adjusting aperture, shutter speed, or ISO (or a combination of all three to achieve the desired exposure) with the rear command dials.

**Select a White Balance** – White balance selections are a very important component of the exposure. In order to achieve an accurate representation of color within an image the correct white balance (color temperature) must be set. The camera user should evaluate the type of lighting within a scene and make the necessary adjustments in white balance. Common lighting environments include daylight, shade, cloudy (outdoor environments), or (indoor scenes) flash, incandescent, fluorescent. Most digital cameras have an “Auto” white balance. This setting is appropriate for many environments, but is not recommended for use in incandescent environments because the color temperatures available when using Auto white balance are outside of actual color temperatures in an incandescent environment.

**Select the ISO Sensitivity** - ISO Sensitivity is the digital equivalent of film speed. The higher the ISO sensitivity, the less light needed to make an exposure, allowing higher shutter speeds or smaller apertures when in lower lighting environments. There is a direct correlation between higher ISO’s and noise in an image. ISO selections should be made based on resolution and image quality vs. need. Higher ISO settings exhibit more visible digital noise.

**Select a Focus Mode**- depending on how the user wants to achieve focus, the correct focus mode must first be selected. The two primary options to select focus are camera controlled **auto focus**, or user controlled **manual focus**. When manually focusing a subject, object, or scene the user must select the manual focus mode from the focus mode selector located on the side of the lens. Once the manual focus mode is selected the user can adjust focus by manipulating the focal ring on the camera lens. In the auto focus mode, the user has additional options regarding how they want the camera to autofocus.

**Identify the Nomenclature of the Canon Speedlite Electronic Flash Unit**

The Canon Speedlite is the electronic flash unit currently in use by the Forensic Services Division. The unit integrates flawlessly with the Canon EOS cameras in use by the FSD, and various other Canon EOS SLR camera systems. This flash unit is used
to add artificial illumination in poorly lit scenes, accentuate detail during three dimensional impression photography, and illuminate large outdoor scenes at night using the painting with light technique. This flash unit can be used, and controlled, from the camera’s accessory shoe (hot shoe) or by a wireless transmitter. It comes standard with a built-in bounce card, wide angle diffusion lens, and a stand for off-camera remote operation.

**Canon Speedlite Parts and Functions**

- A bounce card is located on the top of the flash head, slid in to a small compartment. This can be used to reflect light from the flash onto the subject in close-up situations or to create a highlight in a subject’s eyes while using a bounce flash technique.
- The flash head is omni-directional, and can its position can be controlled by depressing the flash head tilting/rotating lock release button located on the side of the head (enclosed in a soft rubber boot).
- The battery chamber is accessed on the side of the flash unit. There is no indicator that establishes remaining battery life for the Canon Speedlite. A good gauge used to determine battery life is the recycle time between flashes.
- The built-in wide angle flash diffuser is located under the built-in bounce card and is used to increase the angle of coverage to match wide angle (14mm & 17mm) focal lengths of the lens being used.
- The AF Assist illuminator is located on the front of the Canon Speedlite, and automatically activates when using an autofocus mode in poor lighting conditions.
- The mounting foot is located on the bottom of the Canon Speedlite and is used to integrate the flash onto the camera’s hot shoe or onto a stand for remote operation.
- The LCD panel is where all of the flash settings, menu options, effective ranges, and EV compensation settings are displayed.
- The control buttons for flash mode and menu options selections are located on the back of the flash unit under the LCD.

The **Canon Speedlite** has various **modes** that can be selected for use. These modes offer automatic and manual flash operation.

1) **E-TTL** - In this mode, the flash illumination that is reflected back from the subject is detected by the camera’s TTL auto flash sensor and the camera automatically controls the flash output level to give the correct exposure. More or less flash can be delivered using the control dial on the back of the Canon flash, depending on the need. This is referenced in the LCD as EV (exposure value).
2) MULTI - In this mode, the flash output level is automatically adjusted for a well-balanced exposure of the main subject and background.

3) MANUAL (M) - When using the manual mode the user will program flash output levels based on distance, ISO setting, and aperture. This is the most powerful flash mode and is most often used at nighttime crime scenes.

Digital Imaging File Formats

In film photography the resolution of an image and latitude for enlargement is determined by the format (negative size) of the actual camera, which in turn designates a particular film size. With digital photography there are numerous in camera options that will influence resolution, latitude for enlargement/analysis, quantity of images that can be recorded on the digital media, and even speed in which the camera user can capture images.

1. Lossy compression - digital cameras capture and collect data that can later be translated into photographs and images of scenes, objects, subjects or in our case, evidence. When this data is collected in a digital camera, the user can select from a host of options that influence how much data is actually collected. The sensor size, or megapixel count, of a digital camera influences how large these data files are. Multi megapixel high resolution digital cameras have the potential to generate enormous sized files. If all of the available data is not collected and stored, then compression occurs. Lossy compression is identified as being any compression format that permanently discards data to achieve smaller file sizes.

1. Lossless compression - A method for reducing the size of a photographic file so that when it is uncompressed, the resulting image matches the quality of the original source.

2. JPEG (Joint Photographic Experts Group) - A standard for image compression in digital imaging services. JPEG is a compression algorithm that takes 8x8 areas of pixels and compresses the information into the lowest common value. JPEG Fine compresses at a ratio of 1:4, JPEG Normal compresses at a ratio of 1:8, JPEG Basic compresses at a ratio of 1:16.

3. TIFF (Tagged Image File Format) – An uncompressed image file that is best for large printing or analysis.

4. RAW - An uncompressed raw file of the image data directly from the camera’s sensor.

NOTE: As a general rule, image quality for crime scene and evidence photography should be set to minimum compression, JPEG Fine Large, or lossless compression. When photographing images intended for comparison (e.g. latent prints or impressions), the resolution setting should be non-compressed, RAW.
Functions and Operations of Various Camera Lenses

The versatility of SLR photography cannot be overstated, especially when compared to point and shoot style photography. This versatility is owed primarily to the ability to interchange lenses. The five dominant types of lenses are identified by perspective and function, they are: Standard, Macro, Wide-angle, Telephoto, and Zoom. There are countless manufacturers, types, and configurations of lenses available in the consumer marketplace. When deciding on a lens, several important questions should be answered, including: perspective, speed, minimum focusing distance, auto focus capability, quality, and vibration reduction technology.

- **STANDARD LENS** - A standard lens is a lens that makes the image in a photograph appear in perspective similar to that of the original scene. A standard lens has a shorter focal length and a wider field of view than a telephoto lens, and a longer focal length and narrower field of view than a wide-angle lens. An example of a standard or normal perspective lens is a 50mm lens (on 35mm film format). A standard lens, or a zoom lens with an available standard focal length, should be included in a law enforcement photographer’s kit.

- **WIDE ANGLE LENS** - A wide angle lens is a lens that has a shorter focal length and a wider field of view (includes more subject area) than a normal lens. Extreme examples of this type of lens would be a 10mm or 14mm fisheye lens. The angle of coverage with these types of lenses is often 150 to 180 degrees.

- **MACRO LENS** - A macro lens is a lens that provides continuous focusing from infinity to extreme close-ups, often to a reproduction ratio of 1:2 (half life-size) or 1:1 (life-size). Canon offers both macro and micro lenses in various focal lengths. These types of lenses are essential in close-up and evidentiary photography and should be part of the law enforcement photographer’s kit. The closer the lens and camera are to the subject, the higher the maximum possible resolution will be. This higher resolution translates into higher quality evidentiary photographs that are great for courtroom exhibits and could potentially yield positive results during analysis.

- **TELEPHOTO LENS** - A telephoto lens is a lens that makes a subject appear larger on film than does a normal lens at the same camera-to-subject distance. A telephoto lens has a longer focal length and narrower field of view than a normal lens. Although these types of lenses are not needed very often in crime scene or evidence photography, they are often used by law enforcement officers for surveillance details. Focal lengths for telephoto lenses usually begin around 85mm, and can extend into the super telephoto range of over 600mm.

- **ZOOM LENS** - A zoom lens is a lens in which the user can select from a wide range of focal lengths, rather than just one as in the case of a fixed focal length lens (which is also called a prime lens). There are countless combinations of focal lengths to choose from, depending on the desired purpose. This range of focal lengths offers the user some versatility, and often reduces the need to carry multiple lenses in their
kits. One potential drawback of zoom lenses is that they tend to be less sharp throughout their zoom range than a fixed focal length lens would be at any given focal length. However, for crime scene photography, the convenience of high-quality zoom lenses generally far outweighs this disadvantage.

- **LENS SPEED**- Lens speed is identified as the largest lens opening (smallest f-number) at which a lens can be set. A fast lens transmits more light and has a larger opening than a slow lens. The speed of a lens relates to its ability to record detail at a faster shutter speeds due to its light gathering ability, or maximum aperture. There usually is a direct relationship between cost and lens speed, the faster the lens the more expensive.

**Photographic Shooting Platforms Available to the Photographer**

1. In photography stability is an essential ingredient that helps create a sharply focused image. Whether it be a large outdoor crime scene at night to be painted with light or an examination-quality photograph of an item from the scene of a violent crime intended for later analysis, the camera in each of these examples must be as stable as it can be to produce the best quality image possible.

   a. **TRIPOD**- The tripod is probably the most common and widely used shooting platform available. This three legged device will provide exceptional stability for long exposures, or even inverted for shoe and tire impression photography. Countless versions of tripods and tripod heads are available on the consumer market. Many configurations have numerous options and are very flexible in any application.

   b. **MONOPOD**- This one legged device is a good tool to use during surveillance or action photography, but does not have much use in crime scene photography.

   c. **QUADPOD**- A quadpod is a four legged portable device used in a variety of photographic applications. The quadpod can be a useful tool in documenting smaller items of evidence, shoe and tire impression evidence, or mass photographic copying of photographs and document evidence.

   d. **COPY STAND**- A copy stand is a stable platform used primarily in a lab environment for analysis grade photography of evidence. This device allows the user to mount the camera on a telescoping and adjustable arm, and control focus and composition by the adjustment of the arm.

**Chapter Review**
1. An understanding of the digital SLR camera and auxiliary flash nomenclature is an essential component in the success of the crime scene photographer who is tasked with documenting crime scenes or physical evidence.

2. The understanding and selection of the proper image file format is an important aspect of crime scene digital photography, and will ensure additional latitude in printing of courtroom exhibits and use of images for analysis.

3. Various types and configurations of lenses are available in the consumer marketplace. The selection of the proper lens is a very important aspect of photography, and should be considered carefully based on the objectives prior to beginning a photographic assignment.

Stability in photography is critically important in order to achieve a sharply focused image. A variety of shooting platforms is readily available throughout the consumer market, including tripods, monopods, quadpods, and copy stands. The proper selection and use of these will most certainly increase the chances of success for the crime scene photographer.
CHAPTER FIVE: Digital Imaging

CHAPTER DESCRIPTION:
This block of instruction is designed to acquaint the student with digital imaging software and the various tools within the software that can be used to enhance their law enforcement images. This block of instruction will also acquaint the student with the desktop printer, and the various settings necessary in producing high quality prints of evidentiary photography.

GOAL:
Given digital images of items of evidence, the student will open the images in Adobe Photoshop®, perform various traditional enhancement techniques which result in properly exposed and composed digital images, and produce prints that could be used as an exhibits in a court of law.

PERFORMANCE OBJECTIVES:
1. Identify the function of image editing software and the various enhancement and editing tools available in Adobe Photoshop®
2. List the Traditional Enhancement Techniques recommended by the Scientific Working Group on Imaging Technologies (SWGIT)
3. Identify the operation, various custom settings, and maintenance of the desktop printer

Chapter Introduction

With the global transition from conventional film based photography to digital imaging, the forensic science professional must have a solid working knowledge of digital imaging software, along with the various accepted techniques used to enhance and archive their evidentiary photographs. Laboratory professionals should also have a firm understanding of the desktop printer and the various custom settings that can be used to produce higher quality prints which could be used as exhibits in a court of law.

Functions of Image Editing Software and Various Enhancement and Editing Tools Available in Adobe Photoshop®
The primary function of image editing software is to access, view, edit, archive, and print images taken with a digital camera.

By virtue of its name a digital image is different than a traditional gelatin film photograph. In film photography, reflected light striking a light sensitive film creates a negative that can be printed positive in a darkroom during a chemical process. Digital images are different, in that they are recorded using a semiconductor or computer chip that contains a finite number of picture elements, also known as pixels or photosites. Pixels are the smallest individual element in a digital image, holding specific values that represent the brightness of a given color at any specific point. The digital semiconductors contain rows and columns of pixels. Light striking a digital semiconductor is converted into electrons at the pixel cells and is assigned a value associated with the amount of its charge. This value is converted into computer language, or binary code, being a 1 or 0. This binary data is then sent to the camera’s digital media where it is stored, becomes removable, and is arguably more stable than gelatin film.

Most individuals today associate the potential quality (resolution) of a digital image in terms of the amount of pixels available in the camera’s semiconductor, or chip. One million picture elements represent a megapixel. Digital cameras currently available in today’s consumer market range from about 10 megapixels to about 21 mega pixels. There appears to be a direct correlation between the price of today’s digital cameras and the amount of pixels that they contain.

In order to read the 1s and 0s as a photograph, some type of imaging software must be used. Virtually every camera manufacturer provides a copy of their proprietary software with the purchase of a new digital camera. This software allows the user to view and print images taken with a digital camera from their personal computer and desktop printer. Standard issue digital imaging software that is provided with the purchase of a digital camera is often times limited in terms of its ability to edit or enhance digital images. Some camera manufacturers are beginning to market and sell more powerful and feature packed versions of image editing software. Stand-alone software manufacturers currently lead the industry in photo editing software.

The Adobe® Software Company manufactures a variety of image editing software programs ranging from inexpensive consumer versions (including Photoshop Elements® and Lightroom®), to high end and powerful professional versions (e.g. Photoshop Creative Cloud®). Adobe updates its software line frequently (at least annually) and new tools or functions are often added.

**TOOL BOX** – The Tool Box, either fixed in the left hand corner of the screen when the editing function is opened or floating around, contains various tools that are used to preview, edit, and enhance digital images. Some tools are not recommended for law enforcement image editing and will not be identified in this text. Various useful and accepted tools commonly used in a law enforcement application will be identified.
**MOVE TOOL** - The Move tool is located in the upper left hand corner of the tool box. It is identified by an arrow pointing up and to the left, and a cross shape symbol with arrow ends immediately to the right. This tool is used to move around certain items that have been placed within your image in a separate layer, i.e. text, or other photographs. A keystroke shortcut that can be used to access the Move tool is the letter “V” on the keyboard.

**ZOOM TOOL** - The Zoom tool is located in the upper right hand corner of the tool box. It is identified by a symbol that resembles a magnifying glass. This tool is useful in magnifying specific areas within an image for a closer look or for analysis, i.e. fingerprints, tool marks, shoe and tire impression evidence, etc. Once selected the zoom tool can be used by left clicking until the desired magnification is achieved. To zoom back out, depress and hold the Alt key and left click. A keystroke shortcut for this tool is Ctrl + to magnify or Ctrl – zoom out. Another keystroke shortcut that can be used to access the Zoom tool is the letter “Z” on the keyboard.

**HAND TOOL** - The Hand tool is identified by a symbol that resembles a white gloved hand. This tool is useful in viewing specific areas within evidentiary photographs while zoomed in at increased magnifications. Once selected from the tool box (a left click) the Hand tool can be used by left clicking on the screen and holding the left click down while moving the mouse on the mouse pad. This moves the image around the screen so that the desired area of the image can be viewed at increased magnifications. A keystroke shortcut that can be used to access the Hand tool is the letter “H” on the keyboard, or the spacebar.

**MARQUEE TOOL** - The Marquee tool is identified by a dashed rectangle or a dashed ellipse, and is usually located under the Hand tool. This tool is used when applying an enhancement to a localized region of your image, or copying a specific area out of an image. It is selected by a left click, then once selected it can be used by left clicking in an area of your image that the enhancement will be applied. The size of this tool can be regulated by holding down the left click of the mouse and dragging until the desired area for enhancement/copy is selected. Any enhancements done after this selection is made will be localized, or applied only to the area that the marquee is covering. The arrow in the lower right corner of
this tool selection is used to toggle between a rectangular or elliptical marquee. A keystroke shortcut that can be used to access the Marquee tool is the letter “M” on the keyboard.

**LASSO TOOL** - The Lasso tool is a selection tool used to select specific areas within an image that do not follow the shapes offered with the standard rectangle or elliptical Marquee selection tools. As with the Marquee tool, the Lasso tool offers multiple versions of a lasso that can be used to make a selection, identified by the arrow in the bottom right corner of the box. The three versions offered of the Lasso tool are: standard lasso, magnetic lasso (will lock on contrasting detail), and the polygonal lasso (used when dealing with various geometric shapes with definite angles). Once an area is selected using the lasso tool, it can be locally enhanced or copied into another image or document. A keystroke shortcut that can be used to access the Lasso tool is the letter “L” on the keyboard.

**TYPE TOOL** - The Type tool is a tool used to insert text into a photograph. This tool is identified with a capital T on the left hand side about middle way down the tool box. This is a useful tool to identify the significance of specific item evidence within a scene, or when doing a composite. The Type tool is also useful in doing photo-spreads, wanted posters, or BOLO’s. As with various other tools within the tool box, an arrow in the lower right corner of the Type tool indicates that the user has options with this tool as well. Horizontal or Vertical Type can be selected when using this tool. A keystroke shortcut that can be used to access the Type tool is the letter “T” on the keyboard.

**CROP TOOL** - The Crop tool is a tool used to either crop detail out of an image, or to re-size an image to a specific size for printing. This tool is located to the right of the Type tool and is identified with a square symbol with lines protruding from the corners and the center. A left click will select this tool for use, then clicking and dragging within the image will identify the area to be cropped. Once the tool is selected a user can enter specific width, height, aspect ratios, and resolution settings into the Options Bar. When cropping a section of a photo, or cropping to resize, a minimum resolution of 300ppi should be selected. A keystroke shortcut that can be used to access the Crop tool is the letter “C” on the keyboard.

**IMAGE ADJUSTMENTS** - Adobe Photoshop® offers various functions/tools that can be used to enhance, edit, or modify a photograph. The tools that will follow are the ones that are suitable for law enforcement image editing.

**BRIGHTNESS ADJUSTMENT** - We often make photographs that are underexposed, overexposed, or lack the necessary amount of contrast to be considered a “proper”
exposure. Various functions and tools can be used to increase the exposure (brighten) of an under exposed image, or decrease the exposure (darken) an image that is over exposed. These enhancements can be performed either locally, to just the area in need of enhancement, or globally, to the entire image. This ability to select whether or not an enhancement is performed to an entire image, or just to a specific area within an image is a very useful function of Adobe Photoshop®. The ability to perform selective enhancements within an image affords the user the opportunity to bring back detail in certain areas without compromising others.

LEVELS ADJUSTMENT - One of the most effective methods to correct for exposure related problems in an image is to use a Levels adjustment. The Levels function is usually located under "Enhancement" in the options bar. Once "Enhancement" is selected with a left click, various options appear, one being "Adjust Lighting". When "Adjust Lighting" is selected additional options become available, one being "Levels". Once "Levels" is selected a histogram will appear (illustrated to the left of this margin). The histogram contains the tonal information of the selected image. Three arrow shaped "sliders" are located directly under the histogram, these are input sliders. The one on the right represents the highlight values, the one in the center is for mid-tone values, and the one to the left represents the shadow detail. The flow and structure of the histogram represents how many pixels are represented in the particular regions. Images that are grossly over or under exposed will spike in the respective regions on the histogram. Global adjustments can be made to the image by sliding the input sliders in the direction of the exposure problem. If an under exposed image is spiking toward the black, the white slider can be slid in that direction to globally increase the exposure, or brighten the image. Localized adjustments can be done in selected regions of an image using a marquee or other selection tool. Once the area to be adjusted is selected, Levels can be selected and any adjustments will be isolated to the region within the selection.

DODGE AND BURN - Another method to locally adjust the brightness and contrast in a region of an image is using the Dodge and Burn tools. Pictured to the left, the Burn tool (referenced with a hand symbol), will locally darken the selected area. The Dodge tool (referenced with a symbol that resembles a lollypop), will locally brighten the selected area. Once these tools are selected with a left mouse click a circle will appear on the image. This circle represents the area that will be adjusted, and can be adjusted using the bracket keys.
CONVERTING TO BLACK & WHITE - Many times when examining images of forensic value, the colors within the backgrounds become distracting and make it difficult to distinguish important detail. Examples of this may include a processed latent fingerprint on a multi-colored background of a soda or beer can, a ninhydrin fingerprint on a check with multiple-colored security printing, a colored ink signature on a questioned document with a colored background, or maybe even blood or other bodily fluid on an article of colored clothing. In situations like these it is often helpful to “drop”, or isolate the colors of an item so that a proper analysis can be made of the item in question. In Adobe Photoshop® there are several ways to isolate colors for the purpose of extracting information from an image. Different versions of Photoshop® will offer different color isolation tools and techniques.

GRAYSCALE CONVERSION - Images are most often photographed in standard RGB color. One method to remove color from an image is to convert the image profile from RGB (Red-Green-Blue) to grayscale. To do this using Photoshop® go into the options bar and select Image, once Image is selected a dropdown will appear that will afford various options, one being Mode. Once Mode is selected another dropdown will appear that will offer additional options, one being Grayscale. Select Grayscale for the conversion. Depending on the version of Photoshop® being used, several other options will appear that can be used to convert from a colored to black and white image. Lab Color and CMYK are two of these.

HUE AND SATURATION - Another method to convert an image to black and white, or to isolate colors and with a substantial degree of control, is using the hue and saturation function. In the options bar select Enhance. Once Enhance is selected a dropdown will appear with various options, one being Adjust Color. Once Adjust Color is selected another dropdown will appear that will contain several other options, one being Hue and Saturation. Once Hue and Saturation is selected, a control box with sliders will appear (featured to the left of this margin). The edit selection box is one important feature of this function, as it affords the user the opportunity to select whether or not they will adjust the hue and saturation for all colors at once, “Master”, or isolate individual color channels. To the right of the Edit Box is a drop down that will avail all of the individual channels. These channels include the primary colors of Red, Green, and Blue, as well as complimentary colors of Cyan, Magenta, and Yellow. Isolating colors using this feature is a powerful tool for the forensic photographer. A keystroke shortcut to bring up this function is Ctrl U.

IMAGE CALIBRATION - A common aspect of forensic imaging is the need to produce or reproduce prints and exhibits at a known scale. The function of producing a photograph at a known scale, or re-sizing an image on screen to actual size for analysis, is known as calibration. As with many of the functions in Adobe Photoshop®, image calibration can be achieved in several ways. The following will illustrate the necessary steps of one method of image calibration:
1. Set viewing magnification to 100%. To do this use the zoom tool or the keystroke shortcut of Ctrl + until 100% appears in the dialog box that indicates viewing magnification.

2. Select the Crop Tool from the tool palette, or use a key stroke short cut by pressing the letter "C".

3. If using a CS version of Adobe Photoshop® go to the “View” menu (on the top of the screen) and find the option marked “Snap”. If there is a check mark to the left of “Snap”, click on it and remove it. This is one area that the options will vary depending on which version of PS you are using.

4. If an axis in your image (the scale section) is not aligned vertically or horizontally with your computer screen, you may choose to straighten the image. This will help you out later and will only take a second. In a CS version of Adobe Photoshop® find your ruler tool in the tool palette (it hides under the tool icon that looks like an eyedropper). Once you have selected the ruler tool, drag the ruler along an axis in your image (an edge on your scale). After letting go of the left button on your mouse your ruler will remain on the screen. Now, go to the top of your screen and select the “Image” menu. Once the drop down appears, find “Rotate Canvas” and go into it. Once inside Rotate Canvas find the option listed as “Arbitrary”. Select the “Arbitrary” rotation and the adjustment will be made based on the axis that you defined with your ruler tool. This is also good for straightening an out of alignment horizon related photo (sunrise/sunset) as well. Many of the Elements versions of Photoshop® will offer a straightening tool in the tool box.

5. You are about to crop a section out of this image. The section that you crop will be a known distance on your scale (i.e. if your image contains about ten centimeters of scale, you select three or four for the crop). You may decide during this step that you want to take a closer look at the area being cropped, or magnify it on your screen for the selection. If you do, hold down the Ctrl key and depress the + button a couple of times to magnify. If you go too far, hold the Ctrl key and strike the – key, or Ctrl and 0 to get back to where you were. The more accurate you crop during this step, the more accurate and true to size your print will be (if you start the begin point of your crop at the center of the one centimeter line, make sure you end at the same area at the end point of your selection.) Drag your crop tool along a pre-determined distance of the scale (the larger the selection the more accurate the results). Once the crop has been highlighted, press the enter key, or the green check mark to execute the crop.

6. Go to the “Image” menu and select the option labeled “Image Size”. Once Image Size is selected another menu will appear. Make sure the function within this menu that is labeled “Resample” is disabled. A check mark should not appear in the box next to the word “Resample”. There should be what appears to be a chain link between the height, width and resolution.

7. While this menu is open you will enter the known distance” of your crop into the width or height area (depending on how you cropped). Make sure you select
mm, cm, or inches when inputting this information. After entering the known distance take note (write it down) of the value in the resolution field, or highlight and copy it. Once you have the resolution value from the resolution field, close the image size dialog box.

8. You are now going to “Undo” your crop on your image. To do this you can depress the Ctrl/Alt keys simultaneously then strike the “z” key. This is a key stroke unde, or step back function.

9. Select the “Image” menu then choose “Image Size”. Once this dialog box opens double check and make sure that the “Resample” function is still turned off. If not, do it now.

10. Highlight the value displayed in the Resolution field (left click and drag).

11. Paste/Input the resolution value that you previously copied into the Resolution field.

12. Click OK to accept your new 1:1 calibrated image and close the Image Size dialog box!

Traditional Enhancement Techniques Recommended by the Scientific Working Group on Imaging Technologies (SWIGIT)

“The Scientific Working Group on Imaging Technology (SWIGIT) was created to provide leadership to the law enforcement community by developing guidelines for good practices for the use of imaging technologies within the criminal justice system. Although digital imaging technologies have been used in a variety of scientific fields for decades, their application in the criminal justice system is more recent. Consequently, there has been a need to gather and disseminate accurate information regarding the proper application of this and other imaging technologies (including silver-based film and video) in the criminal justice system. The mission of the Scientific Working Group on Imaging Technology (SWIGIT) is to facilitate the integration of imaging technologies and systems within the criminal justice system (CJS) by providing definitions and recommendations for capture, storage, processing, analysis, transmission, and output of images.” (SWGIT) The complete SWGIT guidelines can be found at: https://www.swgit.org/.

Traditional Enhancement - “Traditional enhancement techniques have direct counterparts in traditional darkrooms. They include brightness and contrast adjustment, color balancing, cropping, and dodging and burning. These traditional and acceptable forensic techniques are used to achieve an accurate recording of an event or object.” (Section 5 Recommendations and Guidelines for use of Digital Image Processing in the Criminal Justice System)
BRIGHTNESS AND CONTRAST - This traditional enhancement technique is used to brighten detail in an image or to increase or decrease the contrast. Global or localized image enhancements can be accomplished when using a selection tool in conjunction with a levels, brightness and contrast, or exposure related function.

COLOR BALANCING - when photographing with a digital camera it is very easy to shoot with the incorrect white balance setting. This can be corrected a couple of ways in order to achieve accurate reproduction of the scene, which is important in law enforcement photography. The different versions of Photoshop® offer different methods to correct for color balancing problems. More advanced versions of Photoshop®, including PS7, PS CS, PS CS2, and PS CS3, offer a “White Balance” adjustment for photographs shot in RAW. This adjustment works quite well but may not be available, depending on the available version of the software. Another method of correcting white balance is using the Hue and Saturation function, and adjusting the color sliders until the image reflects an accurate color balance.

CROPPING - the crop tool can be used to selectively control the composition of a law enforcement photograph, excluding unnecessary or irrelevant information. It can also be used to re-size an image for a particular print paper or court exhibit. When cropping a section of a photo, or cropping to resize, a minimum resolution of 300ppi should be selected.

DODGING AND BURNING - this final traditional enhancement technique will allow the user to conduct isolated brightness and contrast adjustments to their image. Various brush sizes can be selected by using the bracket keys. This allows the user to adjust a smaller or larger area within the image during the enhancement.

Operation, Various Custom Settings, and Maintenance of the Desktop Printer

Printing photo quality images from a desktop printer is a common function of today’s forensic science professional. Whether it is a general documentation photograph for a page of bench notes, a photograph that will be used to compare two pieces of evidence to render a conclusion, or an exhibit that a prosecutor needs for trial, desktop printing is a regular element of our occupation. Different printer manufacturers offer different setup and maintenance selections, but most offer intuitive step by step procedures for achieving the best possible print quality and rectifying maintenance related issues.

The three common types of desktop printers include inkjet, laser jet, and dye sublimation. Each of these printers function in different ways, but all are capable of producing high resolution photo quality prints when set up properly.

- Inkjet printers spray tiny droplets of ink onto the paper from cartridges within the printer.
- Laser printers utilize toner that adheres to an electronically charged drum which is then released onto the print paper as it feeds through the printer.
Dye Sublimation printers work by heating up colored films that are in a cartridge and melting the colors onto photo paper as it cycles through the printer.

**PAPER TYPE** - When printing photographs from a desktop printer, the user must select the proper photographic quality paper to be used. Black and white or color photographs will not print well, or contain the requisite level of resolution, when printed on plain copy paper. There are countless companies that manufacture printer papers of all different sizes, textures, and sheens. Acid free and archive quality print papers are also available. After sending a print to the printer from the file menu of Photoshop® the printer properties screen will generally appear. It is from this screen that the user can control and influence the print quality. One of the first settings should be to set the proper “Media Type” from this screen’s dropdown menu. A number of types of print papers are available to choose from in this dropdown. A **quality** slider is also present on this tab, and can be adjusted from normal to photo quality. Also available from this screen is a mode selection. When the “Custom” mode is selected the user has more quality control options, one being to de-select the “high speed” print function. This will result in a better quality print.

**PAPER SIZE** - The next tab on the screen is the Paper tab. Once selected the user has several options to select from in terms of print paper size. This screen also offers an orientation selection and printable area selection. These must be set according to the orientation of the print and the desired print size.

**MAINTENANCE** - One of the most challenging issues associated with desktop printing is poor quality related to head clogs and vertical banding that appear in the prints. This is a common dilemma associated with ink jet printers, but an easy one to fix. Open the Utility tab to access the maintenance options. Within the maintenance options you can check ink levels, realign the print head, or clean the head. Selecting nozzle check will offer a print that will show any deficiencies, or clogs in the head. From there the user can conduct a head clean which will most often remedy the problem. Leaving an inkjet printer turned on for long periods of time, and long intervals between printing are most often the culprits behind head clogs. Turning the printer off between jobs and routine head cleaning is recommended for consistent quality printing.
Chapter Review

The primary functions of image editing software include accessing, viewing, editing/enhancing and printing digital images. There are various tools within Adobe Photoshop® that can be used during law enforcement image processing to bring about better exposures, or to conduct forensic analysis.

The Scientific Working Group on Imaging Technologies (SWGIT) is a working group dedicated to providing a foundation for digital imaging for law enforcement professionals. There are a host of recommendations (seventeen to date) developed by the SWGIT concerning law enforcement digital imaging. PDF printable versions of the “guidelines” and a host of additional information concerning various law enforcement forensics and technology related applications can be accessed through the International Association of Identification at www.theiai.org.

The desktop printer is often a workhorse for the law enforcement professional. When set up and used properly many of today’s desktop printers can output high resolution photo quality prints that can be used for general documentation, comparison examinations of evidence, or courtroom exhibits. The proper paper, setup, and maintenance are essential in achieving a professional-looking high quality print.
CHAPTER DESCRIPTION:
This chapter is intended to introduce the student to the operation and many uses of electronic flash in photography. Objectives and techniques instructed during this block include direct on camera flash operation, bounce flash operation, off camera cabled operation, off camera wireless remote operation, multiple flash wireless remote operation, and diffused-close-up flash operation.

Goal:
Given a digital SLR camera system and auxiliary electronic flash unit, the student will photograph a variety of items of simulated evidence under various lighting conditions resulting in properly exposed photographs that could be used as evidence in a court of law.

PERFORMANCE OBJECTIVES:
1. Identify the methods of controlling the auxiliary flash unit
2. List the three primary angles of lighting commonly used in conjunction with an electronic flash
3. List various techniques for controlling the effects of illumination from the electronic flash unit

Chapter Introduction

One of the most important, but also most challenging aspects of photography is flash photography. A solid understanding of the various methods and techniques associated with controlling the effects of the electronic flash is essential to the forensic scientist and crime scene photographer. Whether documenting individual items of physical evidence, injuries on human skin, or overall crime scenes, flash photography in an integral component for the crime scene photographer.

Methods of Controlling the Auxiliary Flash Unit

When used in conjunction with many of today’s digital SLR camera systems, the
auxiliary electronic flash unit can be controlled in a variety of ways. Depending on what the photographic objective is, one particular type of flash operation may produce better results than another.

**ON-CAMERA OPERATION** - one of the most common applications for flash photography is having the flash unit mounted on top of the camera’s accessory shoe, or “hot shoe”. This on-camera application, when used properly, can produce outstanding results for overall scene photography in diminished lighting conditions, or when photographing items that are in need of additional illumination in order to accentuate detail hidden by shadows.

Select proper flash mode from the mode selector on the Canon Speedlite based on objective or desired effect.

a) E-TTL - Camera automatically controls the flash output level to give correct exposure based on exposure control information).

b) MULTI (Stroboscopic) - This operating mode allows the flash to fire repeatedly, during a single long exposure.

**OFF-CAMERA OPERATION** - Another method of operation that may yield desirable results in various situations is off-camera flash operation. This method is most commonly used in crime scene photography when oblique lighting of the subject (e.g. impression evidence) is required.

**WIRELESS OFF-CAMERA OPERATION** – Requires the use of the proper wireless transmitter mounted to the camera’s hot shoe and the flash unit to be set to the proper wireless mode (Slave).

**CABLED OFF-CAMERA OPERATION** - Requires the use of a cable, of which one end is attached to the flash and the other end is mounted on the camera’s hot shoe.

---

**The Three Primary Angles of Lighting Commonly Used in Conjunction with an Electronic Flash**

1. **Front Lighting** - Front lighting is suitable for many applications associated with crime scene photography. Front lighting typically refers to the flash being on the same axis of the camera lens, firing from the camera in the direction of the subject or object. This type of flash offers a lot of supplemental illumination in most cases, however, could cause uncomplimentary hard shadows that may hide important detail or even
other items of evidence. Hard shadows are created as a result of silhouetting that occurs when the powerful illumination originating from the flash head strikes the subject, or object, and continues on to light the background with the exception for the areas that are on the opposite side of where the illumination struck, thus creating a deep dark void in an image. Front lighting can include bounce flash.

2. **Back Lighting** - Back lighting is a technique used when photographing an item of evidence on a surface that is opaque or virtually transparent. Examples of this may include a latent fingerprint processed with cyanoacrylate fuming technique ("Superglue"). In this lighting technique, a light source is placed behind the object (electronic flash or constant light source) and the item is photographed. The photographer may choose to place a dark or light card in the background (depending on the color of the evidentiary item) to accentuate the contrast and detail of the actual print. Back lighting is also commonly used in subject or portrait photography to highlight the subject from the background.

3. **Side Lighting** - Side lighting, also known as oblique lighting, is a technique commonly used in law enforcement photography to accentuate detail in the troughs and furrows of 3-dimensional impression evidence. Items like shoe tracks, tool marks, vehicle tire tracks, bite marks, physical injuries from assaults with weapons, and indented writings are all good examples of evidence that can be photographed using this technique to bring out detail which would otherwise be latent. Using direct lighting on 3-dimensional evidence can fill in the detail that examiners and laboratories are looking for when making comparisons, and could prove to be counterproductive. Oblique and low angle lighting can be used in conjunction with a deflector card to better control the effects of this technique.

- **Set-Up** - When photographing 3-dimensional evidence at the scene for later analysis, the proper composition and set up are essential. The camera should be mounted on a tripod. The tripod legs should be extended enough so that the evidence can be composed in such a fashion that it fills the frame. The camera should be at a 90° angle to the surface of the evidence (an angle finder can be used to transpose surface angles to the tripod head and camera back). Consider inverting the head of the tripod on models that will allow this. The evidence should be composed squarely within the frame with little information showing other than the actual item of evidence and a scale (exclude all non-relevant items from the composition).

- **Select a shooting mode** (manual). Set the shutter speed to the flash synchronization speed (1/250). Set aperture to one that will afford suitable depth of field (f11-f22). Pick an ISO setting that will afford suitable quality with minimal noise or artifacts (ISO 100-200). **DO NOT METER THE EXPOSURE!**

- **Cable the flash to the camera’s hot shoe using a TTL flash cord, or program flash for wireless operation.**

- **Install shutter release cable or use 2-second timer delay setting.**

- **Eliminate strong ambient lighting by use of a dark cloth, umbrella, or other shield.**

- **Position the flash head at an oblique angle to the impression. The correct angle of flash during oblique flash photography is dependent upon a few variables.** The
distance from flash to subject, flash output, and the depth of the impression being photographed will together determine the correct angle of flash to subject. The use of a flashlight can aid in the selection of the correct angle of light necessary to achieve the desired exposure with complimentary shadows. Too high of an angle of light will cause detail in the impression to be washed out. Too low of an angle of light may cause valuable detail to be hidden in the hard shadow region. Angles from 45° down to 15°, or lower, may be necessary to achieve the desired results. The use of a reflector card positioned on the opposing side of the flash may also be used to bring back some of the detail of the impression, while still accentuating the majority of the track with the stronger shadows. With long impressions, such as shoe and tire prints, take several photographs with the flash positioned at intervals around the impression (all at the roughly the same oblique angle). This will ensure all the detail in the impression is recorded.

Various Techniques for Controlling the Effects of Illumination from the Electronic Flash Unit

Flash photography often turns into somewhat of an unbridled horse for many crime scene professionals, difficult to control and easy to get away from us. Over exposure, under exposure, or partial exposures and unacceptable hot spots are common occurrences when photographing important evidence. However, there are dozens of techniques that we can use to regain control of the electronic flash that will result in great exposures that will boost confidence and the value that our photographs can add to a criminal investigation.

Bounce Flash

When photographing crime scenes, evidence, or subjects while using an electronic flash we often create undesirable hard shadows and areas that are overexposed. One method to control these hard shadows is to bounce the flash off of a ceiling or wall to soften the effects while reducing the hard shadows. The bounce flash technique is also an effective technique to use when photographing highly reflective surfaces, i.e. mirrors, picture frames, writing, serial numbers, or printing on metallic objects. A couple of important things to note about using this technique:

a) Bouncing the flash off of a colored wall will give the subject or scene the color cast of the wall that the flash was bounced off from (select a white wall or ceiling when possible).

b) Anytime a bounce technique is used, a reduction in flash efficiency will occur. This relates to the inverse square law. As the distance of light doubles, its intensity is quartered. When using an automatic flash program (mode), the flash will generally
compensate for the loss of efficiency by increasing output. When using manual flash and a bounce technique, the user will have to compensate from one to two full stops, depending on the ceiling height.

c) As a rule of thumb, the optimal distance between the bounce-point for the flash and the subject/object being photographed when using this technique is about midway. A good way to achieve this distance is by estimating the half-way point between subject and photographer and drawing an imaginary vertical line from the subject to the ceiling. Once a point on the ceiling has been established, it will become the area where the flash is directed for the bounce technique.

**Diffused Flash**

Objects that are highly reflective will commonly result in extreme overexposure when photographed using an electronic flash. These “hot spots” can be controlled using a diffused lighting technique.

The Canon Speedlite comes standard with a built-in diffusion lens (also doubles as a wide-angle lens) that can be extended over the front of the flash to soften the effects of the harsh light. Alternatively, a diffusion dome may be placed over the head of the flash.

The flash can also be used with a diffusion dome in conjunction with a bounce technique to soften the effects of harsh light while controlling any undesirable shadows.

The crime scene photographer is commonly tasked with photographing metallic objects (e.g., handguns, door knobs, knives, burglary tools), or blood and/or fingerprint evidence that is on metallic objects. There are several field-expedient tools that may be used to evenly illuminate these types of objects or surfaces. One example of this is a stainless steel revolver photographed on a stand that is inside a Styrofoam cooler with multiple flash units firing from outside of the cooler to evenly illuminate the object without any overexposure. A white five-gallon painter’s bucket can also be used in a similar fashion to accomplish desirable results. When the flash is fired from outside of the enclosure, the light is diffused and spreads throughout, virtually eliminating shadows and hot spots. There are dozens of flash domes and soft boxes available on the consumer market that are used to diffuse the effects of the electronic flash, but these products can be easily created using a host of readily available items from the garage, home, or office. The TTL or manual flash modes can be used with this technique.

Other items that can be used to diffuse the effects of the electronic flash may include a white handkerchief or plain white piece of paper positioned in front of the flash unit. If the effects of the flash are still too much, the photographer can fold the handkerchief or paper in half to further diffuse the light. One of the nice aspects associated with digital photography is that the camera operator can preview in between shots until achieving the correct exposure.

**Distance**

Another method for controlling the concentration and effects of the electronic flash unit is to increase or decrease the distance between the flash and the subject being
photographed. This method works best when operating the flash in the manual mode, as when operating in an automatic mode the flash unit will attempt to compensate for distance modifications by increasing or decreasing the output. When operating in the manual mode the user can apply the inverse square law, which states that light diminishes by the inverse square of the distance traveled. As the distance the light travels doubles, its intensity is quartered.

**Aperture**

Opening the aperture of the lens or stopping it down is one of the most effective methods of controlling the effects of the electronic flash. When operating the flash in an automatic mode (E-TTL, MULTI) the flash unit will attempt to compensate for exposure value changes in aperture by increasing or decreasing flash output. When operating in the manual mode at a specific output value, the user can regulate the level of exposure by adjusting the aperture. If more exposure is needed, the user can open the aperture and adjust accordingly. If less exposure is needed, the user can stop down the lens aperture and adjust accordingly. The user should preview each image between exposures until the correct exposure is achieved.

**Shutter Speed**

Shutter speed is an important component of using an electronic flash. The proper synchronization speed must be set in order for the flash to fire at the exact time that the shutter curtain is completely open. When using the Canon EOS digital SLR camera, a range of shutter synchronization speeds are available. This range typically ranges from 1/60\(^\text{th}\) of a second to 1/250\(^\text{th}\) of a second. Incremental changes in shutter speed can be used to increase or reduce the influence of the electronic flash on an exposure.

**Chapter Review**

The electronic flash opens countless photographic opportunities to the crime scene photographer. Through the proper use of flash, the photographer is no longer bound to optimal lighting conditions when photographing subjects, scenes, or evidence.

Flash photography tends to be one of the single most challenging aspects of photography. The variables associated with controlling an exposure while using an electronic flash can become barriers to achieving the correct exposure. A solid understanding of how to control the effects of electronic flash through use of aperture, bouncing techniques, or diffusion is essential for success in crime scene photography.
CHAPTER SEVEN:
Specialized Photography Techniques

CHAPTER DESCRIPTION:
This lesson includes an interactive lecture followed by a comprehensive hands on laboratory in which students will have the opportunity to learn and demonstrate various techniques associated with conducting high quality forensic photography on a host of challenging subjects and surfaces.

GOAL:
Given a forensic based photographic objective on a difficult or challenging surface, the student will select the appropriate photographic technique that is necessary to acquire properly composed, properly focused, and properly exposed evidence quality images of the subject.

PERFORMANCE OBJECTIVES:
1. Photograph evidence on highly reflective surfaces
2. Photograph evidence on curved surfaces
3. Photograph evidence on clear surfaces
4. Photograph 3-dimensional impression evidence
5. Photograph watermarks in paper
6. Conduct close-up photography of extremely small evidence using extension tubes

Chapter Introduction

Capturing high quality photography of evidence on reflective, curved, and other non-typical surfaces can pose a challenge to the crime scene photographer. Documenting watermarks, 3-dimensional impression evidence, trace evidence, fracture matches, and extremely small objects or text, involves photographic procedures that deviate from the norm and require specialized techniques. This block of instruction will introduce the student to various techniques associated with capturing high quality images of a variety of evidence on a host of challenging surfaces.

Photography of Evidence on Highly
Reflective Surfaces

Scenes that contain highly reflective surfaces can pose significant problems for the crime scene photographer when using an electronic flash. The distracting ‘hot spots’ and over exposed areas from reflective objects can ruin an otherwise good photograph. This problem is exacerbated when conducting close-up photography of metallic objects or evidence on reflective surfaces.

Crime scene photographers are commonly tasked with making high quality photographs of various metallic objects including firearms, knives, tools, jewelry, etc. In addition to photographing the object itself, latent prints are frequently developed on reflective surfaces that require additional photography.

Light striking reflective surfaces is not absorbed by the object and generally reflects directly back into the camera lens, causing overexposed areas commonly referred to as ‘hot spots’.

When conducting close-up photography of latent or processed friction ridge evidence, these reflective areas can compromise the quality and detail of the print. Losing detail during the preservation of friction ridge evidence could make the difference in identifying the suspect or not.

1. When photographing this type of evidence on location ("in situ"), the photographer may have no control over removing the object from the scene for additional photography in a more controlled environment. An example of this type of evidence may be as common as a processed latent fingerprint on the door knob at a residence. In these situations, the photographer should identify the origin of the harsh reflections, usually the overhead lights, and eliminate them from the equation by turning them off. If the culprit is stray ambient light streaming in through a window, simply close the blinds or block the incoming light from reaching the subject of the photograph.

2. Once the lights are eliminated, a tripod mounted camera is essential due to the long exposure times that a reduced lighting scene will generally require. Most scenes will still have sufficient residual lighting streaming in from windows or from other rooms to conduct photography.

3. In cases where turning off the overhead lighting creates a completely dark environment, a bounce flash or diffuse lighting technique may have to be used to sufficiently illuminate the subject.

4. In situations where the overhead lighting cannot be turned off, the photographer can attempt to eliminate the harsh reflections by opening an umbrella and positioning it between the ceiling lights and the subject of the photograph.

5. When a persistent reflection exists, a diffusion tent of translucent material may be constructed and placed over the object. The goal here is to provide soft even illumination and eliminate the harsh glare of uncontrollable light on the reflective object.

A field-expedient diffusion tent can be constructed in minutes from a wide variety
of readily available materials that include: a white pillow case, a white lamp shade, a white five gallon bucket, white shower curtain material, a large Styrofoam cup or Styrofoam cooler, etc. When using a translucent material other than white in color, the subject may assume a color cast that is consistent with the diffusion material; this is why white material is essential for diffusion.

When constructing a diffusion tent, a hole for the camera lens must be made in the material. The material, depending on the type, can then be secured to the lens with a rubber band. The material is then draped or positioned around the reflective object and ambient light is softened and evenly distributed as it passes through the material, eliminating the harsh reflections.

- When visible latent fingerprint evidence exists on extremely reflective surfaces, such as compact discs, the axial or coaxial lighting technique may produce favorable results.

- Coaxial lighting (sometimes called front directional lighting) involves the use of a clear piece of flat glass positioned at about a 45 degree angle between the camera lens and the subject. A relatively strong light source is then directed at the angled bottom side of the glass (side closest to the subject) so that the light beam is reflected onto the subject. The photograph is taken through the piece of glass, so a hot spot from the light may be seen on the glass in the final photograph. Therefore, it may be necessary to move the light source and clear glass around at various angles and distances until the best lighting for the evidence is obtained.

**Equipment:**

- Tripod, copy stand, or Quadra pod mounted SLR camera system.
- Film/sensor plane parallel to the subject.
- Close-up lens, i.e. macro or micro.
- Cabled or infra-red remote control.
- Clear piece of glass larger than the subject being photographed

**Procedure:**

- Select appropriate resolution, white balance, and film speed settings.
- Use Manual shooting mode.
- Select the appropriate aperture for the subject. Squarely fill the frame/viewfinder with as much of the subject as possible while not cropping out detail.
- Position clear glass between lens and subject.
- Make the necessary adjustments to the glass while illuminating it with a concentrated light source from the side. Adjust until the evidence can be clearly visualized in the viewfinder.
- Manually focus lens on subject.
• Acquire photograph of subject and confirm exposure, composition and focus by carefully previewing the image in the LCD.

• Acquire additional examination quality images of the subject by including a scale.

NOTE: The coaxial lighting technique can also be used to illuminate evidence inside of containers, or deep inside an area that light cannot reach, e.g. inside the barrel of a firearm that contains biological or other types evidence.

Visible or processed latent friction ridge evidence on mirrors can also be a challenge to accurately document with photography.

When positioning the camera directly above any evidence on a mirror, the camera equipment, photographer and background are generally captured along with the subject of the photograph.

A common technique used to eliminate the photographer and equipment from the image in situations like these involves positioning the camera equipment at an angle to the subject so that the equipment is not included in the composition. This technique could introduce some angular distortion that would require post capture correction with imaging software, and will not eliminate a secondary image that is created with photographing evidence on most mirrors.

To eliminate the secondary image—photographer and camera equipment from being captured when photographing evidence on a mirror—the photographer can position a section of white card or foam core board between the lens and subject. Then, drill a small hole, slightly larger than the physical size of the aperture in the card and line up with the aperture of the lens. This technique will allow the evidence to be photographed without distortion or background interference.

Photography of Evidence on Curved Surfaces

Processed friction ridge evidence on curved surfaces is a common subject during forensic or crime scene photography. An example of this may include the earlier mentioned processed latent fingerprint on a door knob, or the curved section of a counter top. The goal of the photographer is to preserve the evidence while capturing as much detail of the friction ridge evidence as possible. Depth of field and proper composition are of primary concern during this type of photography. These types of photographs can be taken in either the aperture priority or manual modes.

• Relate the evidence to the scene with midrange/relationship photography.

• With a tripod mounted camera, with a macro or micro lens installed, compose
a close-up photograph of the friction ridge evidence so that it fills the frame in the camera’s viewfinder.

- Select an aperture that will maximize depth of field, i.e. between $f_{11}$ – $f_{22}$.
- Acquire a test photo of the subject and zoom the image during preview to confirm critical focus throughout the image.
- Once the exposure settings are established, make an examination quality photograph of the subject.

**NOTE:** Examination quality photography requires that a properly labeled scale is included in the composition. The scale should be flat and thin, and at a minimum should contain the date, the photographer’s initials, and the number of the item being photographed. The scale should be positioned at the same focal plane, and as close as possible to the impression/object being photographed.

In situations involving a large section of friction ridge evidence that extends beyond the acceptable depth of field, the photographer may have to re-position the camera to capture additional detail. In cases such as this, overlapping coverage of the detail should be acquired.

**Photography of Evidence on Clear Surfaces**

Photographs of friction ridge evidence on clear surfaces can lack the necessary contrast for making an identification. In an effort to produce the highest quality image, the photographer must attempt to produce a photograph that contains sufficient contrast so that a thorough examination is possible.

- One simple technique to photograph evidence on clear/transparent surfaces is by placing a contrasting colored card behind the subject. An example of this may be a visible latent, or a faint latent print developed with a cyanoacrylate fuming technique on a clear drinking glass or plastic bag. If the print is light in color, place a dark colored card behind the print and front light the subject with diffused lighting. If the print has been processed with a dark powder, use a white or light colored card behind the print. This technique will generally produce acceptable results by providing the contrast necessary to visualize the print detail. This technique may also produce acceptable results when photographing processed and latent fingerprints on windows.

- Another method used to photograph visible or processed latent prints on clear surfaces is to use a transmitted or back lighting technique. When using this technique, the subject (surface fingerprint evidence) should be positioned between the camera lens and a light source. The light is then transmitted through the clear surface but blocked by the friction ridge evidence, providing contrast. Depending on
the subject, either a diffuse transmitted or direct transmitted light may produce better results. Experimentation with both may be necessary to make a determination.

✓ Tripod, copy stand, or Quadra pod mounted SLR camera system.
✓ Film(sensor plane parallel to the subject.
✓ Close-up lens, i.e. macro or micro.
✓ Cabled or infra-red remote control.
✓ Select appropriate resolution, white balance, and film speed settings.
✓ Manual or aperture priority shooting mode.
✓ Select an aperture that will ensure critical focus throughout the subject, i.e. f 11 – f 22.
✓ Squarely fill the frame/viewfinder with as much of the subject as possible while not cropping our detail.
✓ Position contrasting card or material behind subject to increase contrast in subject, or...Illuminate subject from behind with diffuse or direct transmitted light.
✓ Manually focus lens on subject.
✓ Integrate wireless or cabled remote electronic flash unit.
✓ Acquire photograph of subject and confirm exposure, composition and focus by carefully previewing the image in the LCD.

Photography of Three-Dimensional Impression Evidence

Evidence that contains texture, or three dimensional detail, should be photographed so that the detail can be clearly visualized in the image.

Common subjects that contain three dimensional detail include, but are not limited to: footwear and tire impressions, indented writings, bite marks, tool marks and even fingerprint impressions left in certain malleable materials.

Front lighting these types of subjects can fill in the troughs and furrows of the evidence with light and can be counterproductive in defining the three dimensional detail.

To effectively capture the three dimensional detail of textured subject, the photographer should utilize oblique lighting techniques.

✓ Tripod, copy stand, or Quadra pod mounted SLR camera system.
✓ Film(sensor plane parallel to the subject.
✓ Close-up lens, i.e. macro or micro.
✓ Cabled or infra red remote control.
✓ Select appropriate resolution, white balance, and film speed settings.
Manual or aperture priority shooting mode.

Select an aperture that will ensure critical focus throughout the subject, i.e., \( f/11 \) – \( f/22 \).

Squarely fill the frame/viewfinder with as much of the subject as possible while not cropping our detail.

Manually focus lens on subject.

Integrate wireless or cabled remote electronic flash unit.

Photograph in ambient lighting conditions without side lighting.

Re-photograph subject with the flash positioned at varying degrees of angle, i.e. 10 - 45 degrees.

The angle of the flash that produces the best results will depend on the depth of the impression being photographed. Deeper impressions will require a higher angle, while shallow impressions may produce better results when photographed at a lower angle.

Once the best angle for the impression is determined, the photographer should acquire multiple photographs from various positions around the impression while duplicating the flash distance and angle. Example: photograph a shoe impression from heel to toe, and from side to side between the legs of a tripod. Doing this may produce better detail in an area of the impression hidden by shadows from another angle.

NOTE: When the electronic flash unit—in manual mode—is integrated with the manual camera exposure mode, care should be taken to ensure selection of the proper flash synchronization shutter speed, as well as the proper flash output based on flash to subject distance, aperture setting, and film speed. This tends to be quite a challenge for new photographers. One option; photograph the subject using the camera’s aperture priority mode in conjunction with the TTL flash mode. If exposure adjustments are necessary, the photographer can increase/decrease the flash output by adjusting the EV (exposure value) setting on the flash unit. An option to the flash on some impression evidence may be a powerful flashlight. This technique works well in a field application with indented writings. When using this technique, a small aperture and longer exposure time will allow the photographer to record the indented writing with an even exposure with a ‘painting’ technique, or by moving the flash light across the impression to evenly expose the subject.

Preview image in LCD and confirm proper exposure, composition, and focus.

Photography of Watermarks in Paper

Unique watermarks appear in a wide variety of stationary and official documents. These watermarks may be helpful in establishing the authenticity of a document or perhaps linking a suspect back to a particular crime.

Photography using a backlighting technique is a simple yet effective process that can be
used to record watermarks in evidence.

✓ Tripod, copy stand, or Quadra pod mounted SLR camera system.
✓ Film/sensor plane parallel to the subject.
✓ Close-up lens, i.e. macro or micro.
✓ Cabled or infra red remote control.
✓ Select appropriate resolution, white balance, and film speed settings for forensic photography.
✓ Position subject on a neutral background, i.e. photographic gray card.
✓ Squarely fill the frame/viewfinder with as much of the subject as possible while not cropping our detail.
✓ Manually focus lens on subject.
✓ Acquire an available light photograph and confirm exposure, composition and focus by carefully previewing the image in the LCD.
✓ Remove gray card and illuminate subject from behind using a diffuse lighting technique, i.e. lightboard, or soft even light source from behind.
✓ Once the subject has been illuminated from behind, adjust the exposure settings for the back lighting and re-photograph.

Close-Up Photography of Extremely Small Evidence Using Extension Tubes

When the evidence that needs to be photographed is extremely small, and a macro or micro lens is just not powerful enough to bring out the necessary detail in the object, specialized equipment is available to enlarge the subject.

The integration of an extension tube between a close focusing lens and an SLR camera system can enable the photographer to enlarge the subject by decreasing the minimum focusing distance of the lens. By decreasing the focusing distance the sensor can be filled by the subject, hence increasing detail in small objects. Depending on the focal length of the macro lens, the photographer can achieve extreme magnification of minute evidence.

Depending on the design of the tube, different magnification factors can be achieved. The tube itself contains no optical glass, they are hollow in design and come in various sizes that allow for increased magnification. The increased magnification is achieved through a decrease in minimum focusing distance. The tubes can be ‘stacked’ together, and used in conjunction with macro or micro lenses of all focal lengths to achieve extreme close-up photography.

Depending on the camera system used in conjunction with an extension tube, certain camera functions may or may not be supported. Many of today’s consumer camera
systems will not support metering or auto focus options once an extension tube is integrated into the equation. In cases such as these, the photographer should first acquire an accurate exposure setting based on the focal length and aperture settings of a lens, and transfer or maintain these settings once the extension tube is installed.

✓ Tripod, copy stand, or Quadra pod mounted SLR camera system
✓ Film/sensor plane parallel to the subject
✓ Close-up lens, i.e. macro or micro
✓ Cabled or infra red remote control
✓ Select appropriate resolution, white balance, and film speed settings for forensic photography
✓ Position subject on a neutral background, i.e. photographic gray card
✓ Squarely fill the frame/viewfinder with as much of the subject as possible while not cropping our detail
✓ Manually focus lens on subject
✓ Acquire an available light photograph of the entire subject and confirm exposure, composition and focus by carefully previewing the image in the LCD
✓ Make note of the exposure settings and install the necessary amount of extension tubes for desired magnification. Make the necessary notes in the photo log regarding the set up
✓ As the magnification increases, it may be necessary to move the subject so that the composition includes the area of interest

Chapter Review

1. Acquiring high quality forensic photographs of certain tricky subjects or evidence on difficult surfaces can be a challenge for the law enforcement photographer.

2. Reflective subjects can generally be controlled by eliminating the light source causing the harsh reflections. Additional techniques that involve diffusion or a coaxial lighting technique may be necessary on items like compact discs.

3. Curved surfaces require maximum depth of field. When photographing evidence on a curved surface, stopping the lens down to apertures between $f_{11}$ and $f_{22}$ will generally produce favorable results.

4. Evidence on clear surfaces may be photographed by just positioning a contrasting colored card or material behind the subject. Other techniques that involve backlighting the subject can also produce acceptable results.

5. Three dimensional impression evidence, e.g. indented writings, footwear and tire impression evidence etc. can be best photographed when using oblique lighting.
Shallow impressions will generally require extremely low angle light, whereas deeper impressions may require a higher angle of light to produce favorable results. Once the proper exposure is established, photographing the subject while the light source is positioned at various locations around the impression will ensure that all of the necessary detail is captured.

6. When the evidence that has to be photographed is so small that it is barely visible to the unaided eye, integrating extension tubes can produce extreme magnifications that allow for high quality photography that can be used for later examinations, analysis, or exhibits.
CHAPTER EIGHT:
Low Light Photography

Chapter Description:
This chapter and lesson will identify various situations in which law enforcement personnel will conduct low light photography. Several techniques will be discussed and demonstrated during the lecture and lab portion of the program that can be used to exploit evidence not readily visible to the unaided eye. Following the lecture, the students will have the opportunity to make high quality photographs of various scenes and evidence under diminished lighting conditions.

GOAL:
Given a scene with diminished lighting conditions, the student will select and utilize the appropriate photographic techniques necessary to acquire properly exposed evidence quality images of subjects, evidence, and the overall scene.

PERFORMANCE OBJECTIVES:
1. Photograph a large outdoor crime scene using the painting with light technique
2. Photograph a large outdoor crime scene using a timed exposure technique
3. Photographically document a crime scene containing trace amounts of blood using a chemiluminescing agent
4. Photographically document the flight path of bullet trajectory in a crime scene using lasers

Chapter Introduction

One of the most challenging aspects of photography that confronts many law enforcement professionals is conducting photography in a diminished lighting environment. Although challenging, the need to photograph crime scenes, evidence, or subjects when the sun goes down, or in low light conditions, is extremely common. Law enforcement professionals tasked with making evidence quality photographs should possess the fundamental knowledge and techniques necessary to succeed regardless of the lighting conditions.

This block of instruction will provide various techniques that can be used to acquire high quality images of scenes, evidence, and subjects under conditions once thought of as being impossible to photograph in, the dark.
The Painting with Light (PWL) Technique for Photographing a Large Outdoor Crime Scene

Large outdoor crime scenes, serious traffic accident scenes, or even large indoor scenes, are quite common to the law enforcement photographer or criminal investigator to document. Scenes such as these are typically quite simple to preserve with photography during daylight conditions. Once the sun sets and the lighting conditions change, the parameters in which the photography is conducted must also change. The painting with light technique is helpful when photographically documenting any large scene in which the burst from a single electronic flash would be inadequate to properly illuminate the entire location and associated evidence.

The painting with light technique involves utilizing multiple bursts of light from an electronic flash unit, or systematic “light painting” with a powerful flashlight or spotlight. The technique can be accomplished with a single person, or with a photographer and either one or two assistants.

**Note:** The advantage to using multiple assistants during the painting with light technique is associated with the abbreviated exposure time necessary to accomplish the properly exposed photograph. In many cases long or timed exposures with a digital camera can exhibit an unacceptable amount of noise. Reducing exposure times with a digital camera may produce an image with less distracting noise.

**TWO PERSON PAINTING WITH LIGHT TECHNIQUE**

Evaluate the physical size and boundaries of the scene. This will help determine approximately how many bursts of light will be required to sufficiently illuminate the location.

a) Larger scenes will require more bursts from a flash unit.

b) Smaller scenes will require fewer bursts from a flash unit.

**IDENTIFY ANY AMBIENT LIGHT SOURCES AT OR NEAR THE SCENE.**

Street lights, traffic signals, and other stray light sources should be identified and intentionally excluded from the photographic composition when possible. This may include lanes of traffic in which vehicles are still permitted to travel during the photography.

Stray ambient light included in the composition of a timed exposure could create distracting over exposed areas in the image. Vehicle lights traveling near or
through the scene of a timed exposure will be rendered as distracting streaks of light that may have to be explained later during judicial proceedings.

Eliminating the potential for distractions in an image will force the viewer’s attention to the subject of the photograph rather than an interesting or distracting photographic phenomenon.

CAMERA AND EQUIPMENT SET UP.

✓ Position the SLR camera on a sturdy tripod at full standing eye level.

✓ Select an aperture that will provide adequate depth of field, e.g. f 5.6 - f 8. Just remember, the smaller the aperture the less light allowed through the lens. Since these types of scenes are generally large, and the photographer is positioned at a significant distance from the evidence, a larger aperture may provide adequate depth of field while at the same time properly illuminating the scene with fewer bursts of light from the electronic flash.

✓ Select the BULB setting for shutter speed. This is typically the last shutter speed setting available, and is usually found after the 30” setting. This setting may be referenced as “TIME” in some digital SLR camera systems.

✓ Select an ISO suitable for low light photography, e.g. ISO 400 - 800+. Newer generation digital SLR cameras have proven able to provide much lower noise at higher ISOs. If acceptable image quality can be achieved at higher ISOs, using them may provide a better exposure with the same or fewer amounts of electronic flash bursts.

✓ Select a white balance consistent with the dominant light source. When using an electronic flash, use the flash white balance setting. If using a rechargeable flash light, i.e. Stream Light or Mag Light, the correct white balance setting is Tungsten.

✓ Install cabled remote shutter release, or program camera for the IR remote shutter release mode. Using a cabled or remote release is essential during a timed exposure. This helps ensure that the camera doesn’t move during the long exposure.

✓ Turn off any vibration reduction option on the lens.

✓ Set the camera to the manual focus mode. Auto focus is generally not an option during the painting with light technique due to the low light environment. When having difficulty seeing to focus, an option may be to use the distance scale on a lens to pre-set focus at a specific distance.

✓ Illuminate the scene with a flash light or spot light to select the proper focal length and composition. Make sure that the composition includes as much of the evidence that you intend to illustrate in the image as possible. This is an overall, or establishing, composition that is intended to show as much of the scene and evidence as possible.

✓ Illuminate the scene with a flashlight, or spotlight, and focus the lens. With large scenes, it may be helpful to focus on an object/area approximately 1/3rd
into the composition. This will help ensure the maximum distribution of depth of field throughout the photograph.

✓ Acquire your black card and ready your partner for the exposure.

**NOTE:** An in camera menu option that should be considered when doing timed exposures is the **Long Exposure Noise Reduction.** Most digital SLR camera systems are equipped with this option, which reduces distracting long exposure noise as the file is processed through the camera. When this option is activated, it is common to have an equivalent internal processing time as the actual exposure time itself. This may be referenced in the camera’s LCD as **Job NR.** This is not an error message, merely a message letting the photographer know that the image is being processed for noise.

**COMMUNICATING WITH YOUR PARTNER(S), CREATING THE IMAGE.**

✓ Prior to beginning the exposure using the two person technique, the team must establish and agree upon a set of terms in which will be used during the exposure. As a suggestion, the terms **OPEN, READY** and **GO** can be used. Keeping the terms as simple as possible will help eliminate confusion during the exposure.

✓ Photographer is positioned at the tripod mounted camera with the black card in hand.

✓ Assistant is equipped with **two electronic flash units** that have **fresh batteries** installed. Using two flash units will cut down on the exposure time, by always having a freshly recycled flash ready to go when in position.

✓ The electronic flash units are used in the manual mode.

✓ Full 1/1 power setting is selected on the flash unit.

✓ The flash is triggered by pushing the test button on the unit.

✓ The test button is very small and at times difficult to trigger. An option may be to install the flash on another digital SLR camera system and activate the flash with an exposure on the second camera. The flash directionality and output settings should be the same as if the flash were manually fired using the test button.

✓ The photographer opens the shutter curtain with the remote control while the front element of the lens is covered by the card. The photographer communicates **OPEN** to the assistant, letting them know that they are prepared to begin the exposure.

**Note:** When moving the card away from and back into position in front of the lens, the photographer should ensure that he/she does not accidently bump the camera or lens with the card. The photographer should also ensure that they are aware of the location of the tripod legs so that they don’t accidentally bump them while moving around during the exposure. Bumping the lens with the card, or kicking a tripod leg, could ruin the exposure by rendering the scene out of focus.

✓ Once the assistant (flash operator) is in position, and the flash is charged and...
ready to fire, he/she signals to the photographer that they are READY. The photographer removes the black card from in front of the camera lens, and signals GO to the assistant. Once the GO signal is communicated, the assistant fires the first flash into the scene. Once the flash fires, the photographer immediately covers the camera lens with the black card and awaits the next ready signal from the assistant.

Note: As a general rule, the flash operator should attempt to stay outside of the camera’s field of view when firing the camera flash. Positioning a set of cones, or photo numerical markers, just outside of the field of view during set up may help establish some boundaries during this technique. The flash should held slightly overhead, be pointed across the field of view (perpendicular to the camera angle), and angled down slightly. The flash should not be pointed back towards the camera position, as this will be visible in the finished photograph as a solid concentrated light source that could be mistaken as a street light.

✓ After the assistant fires the first flash into the scene, they should walk approximately five casual paces down the imaginary line outside of the field of view to set up for the next flash. Once in position, the assistant signals READY to the photographer, and awaits the GO signal. This process is repeated until the entire scene is properly illuminated. Depending on the size of the scene, it may not be uncommon to have 8-12 individual flash bursts to provide proper and even illumination. This can be achieved by firing overlapping flash bursts from two sides of the scene. In some cases this may be impossible, but when possible firing the flash from two sides can produce better results.

✓ Following the final flash burst, the photographer closes the shutter curtain with the remote control and awaits the image review on the camera’s LCD. Once the review appears, the photographer should carefully examine the image to ensure that the scene was properly exposed, focused, and that all relevant evidence was contained within the composition. If any areas within the image suffer from a poor exposure (over or under exposed), the scene should be re-photographed until the correct exposure is achieved.

SINGLE PERSON PAINTING WITH LIGHT TECHNIQUE

The single person painting with light technique can be done when the help of an assistant is impossible to secure. When using this technique, the scene can be ‘painted’ in with an electronic flash as illustrated above, or with a powerful rechargeable flashlight or spot light from behind the camera’s position. This sub-section will discuss this technique using an electronic flash.

✓ Camera settings are identical as mentioned above. The only exception is that the non-reflective black card is not necessary using this technique.

✓ The scene settings and boundaries that were established using the two person method are also identical.

✓ The photographer opens the camera’s shutter curtain and locks it open in the BULB
setting.

✓ The photographer then walks outside of the field of view and fires a camera flash, perpendicular to the camera angle into the scene. The photographer repeats this at intervals of ‘five casual paces’ down and back both sides of the scene until the scene has been properly illuminated.

✓ Once the final flash has been fired, the photographer closes the shutter curtain with the remote control and waits for the results to appear on the LCD.

✓ Once the completed image appears on the camera’s LCD, it is carefully inspected for exposure, focus, and content. If the image suffers from exposure, focus, or content problems it is re-taken until the desired results are achieved.

As mentioned above, the single person painting with light technique can also be done using a powerful rechargeable flashlight, or spotlight.

✓ Camera settings are identical as mentioned above. The only exception is that the non-reflective black card is not necessary using this technique.

✓ The scene settings and boundaries that were established using the two person method are not as important using this technique, as the photographer will operate the light source from behind the camera.

✓ The photographer opens the camera’s shutter curtain and locks it open in the BULB setting.

✓ Using a powerful flashlight, or spotlight, the photographer will systematically paint in the scene. Steady, even, ‘brush strokes’ with the light source from top to bottom throughout the scene will generally produce great results. This may be an option when the photographer has to photograph the scene alone, or when an auxiliary electronic flash becomes inoperable.

✓ Once the final ‘brush stroke’ of light has been ‘painted’, the photographer closes the shutter curtain with the remote control and waits for the results to appear on the LCD.

✓ Once the completed image appears on the camera’s LCD, it is carefully inspected for exposure, focus, and content. If the image suffers from exposure, focus, or content problems it is re-taken until the desired results are achieved.

The Timed Exposure Technique for Photographing a Large Outdoor Crime Scene

Another option for photographing a low light scene is through use of an extended or timed exposure technique. This technique, when done correctly, can make a dimly lit night time scene look like daylight.
This technique is done with a single photographer, and requires very little set up or planning.

1. Attach the digital SLR camera system to a tripod.
2. Select an **aperture** that will provide adequate depth of field, e.g. f 5.6 - f 8.
3. Select the **BULB** setting for shutter speed.
4. Select an **ISO** suitable for low light photography, e.g. ISO 800 - 1600.
5. Select a **white balance** consistent with the dominant light source. When a scene contains multiple light sources, including natural star and moonlight, use the auto white balance setting on the digital camera.
6. Install cabled **remote shutter release**, or program camera for the IR remote shutter release mode.

**NOTE:** Using a cabled release is essential during a timed exposure. This helps ensure that the camera doesn’t move during the long exposure.

7. Turn off any **vibration reduction** option on the lens.
8. Set the camera to the **manual focus** mode.
9. Illuminate the scene with a flash light or spot to select the proper focal length and **composition**. Make sure that the composition includes as much of the evidence that you intend to illustrate in the image as possible. This is an overall, or establishing, composition that is intended to show as much of the scene and evidence as possible.
10. Illuminate the scene with a flashlight, or spotlight, and **focus** the lens. With large scenes, it may be helpful to focus on an object/area approximately 1/3rd into the composition. This will help ensure the maximum distribution of depth of field throughout the photograph.
11. Open the shutter curtain with the remote control and make a ‘test’ exposure for approximately one minute.
12. Review the image and make a determination regarding the exposure.
13. If the photograph is too dark, an additional minute of exposure time (2 minute exposure) will have a one stop positive effect on the overall image. If necessary, adjust and re-photograph until the desired effect is achieved.

**Photographically Document Trace Amounts of Blood Using a Chemiluminescing Agent**

The presence of fresh or dried blood in a crime scene is typically very obvious to detect, and quite simple to document and preserve with conventional photography.
However, when a suspect makes an attempt to hide blood evidence by cleaning it up, the detection and photographic documentation of that evidence becomes increasingly difficult.

Chemical reagents that fluoresce when exposed to trace amounts of blood evidence are available through most forensic supply companies, and include Bluestar and Luminol. Research and regular field use have established that these chemicals have the potential to respond and fluoresce to trace amounts and dilutions of blood at ratios down to 1:5,000,000.

Other applications for these types of chemicals involve blood scenes that have not been cleaned up by the suspects, but that the dark background that contains the blood evidence conceals it from detection. Examples of this may include dark colored floor coverings, window treatments, comforters and bed linens, clothing, and wall paint or wall paper.

– Prior to contaminating the scene with a chemical agent, it should be photographed in its pristine condition with overall/establishing photography.

– An initial evaluation of the scene is required prior to beginning the low light Luminol/Bluestar photography technique. This evaluation should include a search for trace amounts of blood; blood drops, spatter, dark stains, or specific areas that have been aggressively cleaned that are inconsistent with other areas within the scene.

NOTE: When the use of these types of chemicals becomes necessary, the investigator typically doesn’t know exactly where the hidden blood evidence may be located. Often times, through the investigatory process, a general location is narrowed down, and the search for cleaned up blood evidence is attempted. This location may show signs of recent aggressive cleaning in a specific location, not consistent with the remainder of the scene, or even some residual dark stains on a surface. As soon as the chemical agent produces some positive results, the low light photography technique used to document these types of scenes can begin.

With a tripod mounted digital SLR camera, use available light to photograph the scene as is.

– Aperture priority, or manual mode, at about f 8 – f 11 to maximize depth of field.

– Normal to wide focal length. Wider focal lengths will increase the field of view and could increase the chances of capturing fluorescing areas within the scene once the chemical has been introduced.

– Set the correct white balance based on the dominant light source in the room, typically incandescent or fluorescent.

– Install/use a remote shutter release cable or infrared remote shutter control to minimize camera shake.
Prepare the chemical agent that is going to be used to search for the blood evidence. Depending on which agent is used, some mixing and wait time may be necessary. With Bluestar this process takes about ten or so minutes. This brief delay allows for camera set up while you wait.

- **Bluestar** is packaged in a two tablet pack that is mixed together in about 4 ounces of water per kit and misted through a spray bottle or pump sprayer onto the suspected surface.

- **Luminol** is packaged either in a spray bottle in liquid form, or in a dry chemical form in a pouch that is mixed and sprayed onto the suspected surface just as Bluestar is.

Adjust camera settings for a low light **timed exposure** on your tripod mounted digital SLR camera

- Set the camera shutter speed to the BULB setting and prepare for about a 90 – 120 second exposure. Use a stopwatch or second hand on a wrist watch to keep track of the exposure time. Or use a long exposure rather than the bulb setting.

- Set an aperture that will afford moderate depth of field while still allowing for an acceptable exposure time, e.g. **f 5.6** or so.

- Set the ISO to an acceptable ISO for a long exposure, e.g. **ISO 400 – ISO 800+**.

- **Disable** any vibration reduction option on the camera lens.

- **Manually** set and lock **focus** on a subject about one third into the scene. This will help maximize the distribution of depth of field.

- Stand by to open shutter curtain once the fluorescence begins.

**Turn off all available room lighting** and block any stray ambient light streaming through windows or under door cracks.

- Total darkness for this technique is preferred.

- The darker the scene, the more obvious the fluorescing results from the chemical agent and the better the photography results.

- Cardboard, towels, or other like material can be used to block light at windows and doors.

Although this technique can be accomplished alone, the assistance from a helper assigned the duty of spraying the chemical agent onto the suspected area is preferred.

- The fluorescence from the reaction with blood is quite obvious when using Bluestar.

- Luminol will produce similar results, but will generally not fluoresce as bright as Bluestar. When using Luminol, the exposure times may have to be increased...
to achieve similar results.

**NOTE:** When spraying the chemical solution onto vertical painted walls or non-porous vertical surfaces, the liquid will begin to run and spread the fluorescing results into other areas within the scene. Caution should be taken not to spray too much solution into any one specific vertical area.

Once the chemical is sprayed into the scene, and the fluorescing begins, the **camera’s shutter curtain should be opened and locked open** in the BULB setting for approximately 90 – 120 seconds.

When approximately ten seconds remain in the exposure, a **burst from an electronic flash** should be bounced off of the ceiling in the room. The flash output power will depend on the size of the scene and the ceiling height, but as a general rule **½ power output** will provide adequate results to sufficiently illuminate the scene without overpowering the fluorescence of the Bluestar/Luminol.

After closing the shutter from the exposure, the photographer should await the results of the image in the camera’s LCD. Once the image appears, it should be carefully examined for exposure, content, and focus. If any adjustments are necessary, the photographer can repeat the exposure until the desired results are obtained.

Using a timed exposure may be appropriate rather than using the bulb setting and bounce flash. Trial and error may be needed to find the best settings.

**NOTE:** Caution should be exercised in repeating the chemical processing too many times, as this could potentially degrade the blood evidence through excessive dilution. It should also be noted that it is possible to visualize and photograph a ‘false positive’ reaction using Bluestar and Luminol. Research in this area has established that certain high fiber food products and certain paints and varnishes will produce intense false positive reactions. These are potentially distinguishable due to their intense reaction.

**Photographically Document Bullet Trajectories in a Crime Scene Using Lasers**

Reconstructive efforts at shooting scenes can include documenting the position of the shooter relative to the location of the bullet’s impact, or bullet flight path trajectory. Many times this evidence can be extremely valuable, as it can be used to corroborate or discount statements made by suspects and or officers involved in shooting situations.
This technique may also aid in the search for, and recovery of, valuable evidence that is left behind at a crime scene by a suspect. This evidence may be found at the area of origin from where the weapon was fired from, which could remain undetected if never established.

This technique may also be used in locating expended bullet projectiles by tracing the path through an object and beyond. These projectiles could then be collected and submitted for analysis, which may provide valuable evidence during the investigation and later adjudication.

This particular block is included in the low light photography lesson plan, because it involves many of the same principals and photographic techniques associated with the three previous performance objectives.

Two points must be present to properly determine trajectory. Shooting scenes that contain “through and through” bullet holes can potentially yield the most accurate results when using this technique. Examples of “through and through” bullet holes may include bullet penetration through both sides of an interior or exterior wall, through a door, through two sides of a vehicle panel or vehicle door, through furniture, filing cabinets, or other like items. This technique, when used with a thin solid core material may only aid in determining a general directionality of the flight path of the bullet.

The through and through holes allow for the insertion of laser mounted trajectory rods that will ‘point back’ to the location of the shooter(s). Some of the advantages to using this technique over a string technique include: less likely for the flight path to sag or droop over distance, you will not run out of laser as you will string, potentially more accurate and visible in photography.

The technique discussed in this performance objective will provide best results in a darkened environment. Outdoor scenes should be documented at night using this technique and indoor scenes should be intentionally darkened. With the addition of laser(s), the darker the scene, the more visible the results. The use of neutral density filters and extremely small apertures may be an option when the necessity to document these scenes in daylight conditions exists.

- When through and through bullet holes are present in the scene, first photograph them in their pristine condition with parallel photography. Additional photography that illustrates their relative location to the scene should also be acquired, e.g. midrange/relationship photography.

Following the pristine parallel photography of the bullet hole evidence, assign a number or letter for each of the bullet holes and affix an adhesive label with the corresponding letter or number next to the hole. Measurements should be taken for each bullet hole and documented on a sketch. Place a plumb measured scale from ground level extending upward and slightly beyond the highest bullet hole, and re-photograph. A tape measure may be used if necessary. This photograph may prove valuable in later forensic or ballistic analysis, but must include scale.

Carefully insert the projection rods from the trajectory kit into the bullet hole, and through the inner wall and outer wall of whatever object you are working with. Repeat this step for multiple bullet holes. If the distance between the “walls” exceeds the length...
of the projection rod, additional threaded rods can be added so that the correct angle between the “walls” remains accurate. Once all of the projection rods are inserted through the bullet holes, additional photographs should be taken that include this step should be taken.

After photographing the projection rods, establish the angle of trajectory by using an angle level or a protractor. The angle level included in the laser trajectory kit will rest comfortably on the protrusion rod. An angle can then be acquired, and documented, for each numbered or lettered bullet hole. This important information should be noted in any corresponding report. Photographs of the angle for each bullet hole can be made with the angle finder in place, but may be extremely time consuming when documenting multiple bullet holes.

Following the bullet hole photography set up a tripod-mounted camera at a position within the scene so that you can capture both the bullet impact area(s) and the suspected location of the shooter(s). This may have to be established once the flight path is tracked with the laser, but if shell casing evidence or witness testimony suggests a general area then include it in the composition.

- Thread the laser(s) into the end(s) of the protrusion rod(s).
- Set tripod-mounted digital SLR camera in BULB setting for a timed exposure.
- Set aperture at \( f_{5.6} - f_{8} \).
- Set ISO to 400 – 800.
- **Manually focus** on an object about \( 1/3^{rd} \) into the composition.
- Turn laser(s) on.
- Darken the scene.
- Mist the scene with a particulate that will suspend in the air for several seconds or longer (see note below).

**NOTE:** Recording a laser with a digital camera is an additive process. This cannot be achieved unless the laser can be visualized. To visualize the laser, a suspended particulate or non reflective card must be used. Various particulates may be used in conjunction with this technique. Some options may include a “canned fog,” a Halloween Fogging device, or even water spayed from a spray bottle. Caution should be exercised when using a Halloween Fogging device indoors, as it will activate fire alarms. When using a card technique, a non reflective white in color card can be used. The card is positioned in front of the laser beam, and moved along the flight path at a steady gait while the camera’s shutter is open.

Once the laser can be visualized, open the camera’s the shutter with the remote control and leave it open until the entire laser has been fogged into the scene. When photographing multiple bullet trajectories, multiple lasers can be used at the same time and fogged in the same fashion as the first one.

When using the card technique to document the bullet trajectory, with a darkened
scene an individual positions a non-reflective white card so that the laser beam is in the middle of the card. Once the beam is visualized on the card, the individual walks at a steady gait while maintaining the laser beam in approximately the same position on the card.
This technique is repeated for multiple bullet trajectories.
When conducting this technique in an indoor scene that has been darkened, at the end of the laser documentation the photographer can fire an electronic flash toward the ceiling of the room to illuminate the remainder of the scene while not overpowering the path of the laser. This can also be accomplished with a very quick switch of the overhead lights in a room. This technique, if done quick enough, can provide a well illuminated scene throughout, while still rendering the distinct color laser along the flight path that the bullet traveled.

Another method is to document the overall scene and the laser trajectory together. Using this technique the photographer would first acquire an available light photograph of the properly illuminated scene. A second photograph is then taken from the same exact location, but in a darkened scene to capture the laser trajectory. These two photographs are later merged using non-destructive layers in Adobe Photoshop®. This can also be accomplished in camera in many of today’s digital SLR camera systems with a “multiple exposures” option.

**NOTE:** When using lasers to document multiple bullet trajectories from more than one weapon/suspect, the photographer may choose to utilize multiple colors of lasers to distinguish in the photograph the different individual’s relative positions during the shooting incident. An example of this may include using a green laser to identify law enforcement personnel and a red laser to identify suspects in cases of officer involved shootings. Blue lasers are also available in the consumer market, however are quite expensive in comparison to red and green lasers.

**Chapter Review**

When conducting photography in diminished lighting conditions, the evidence photographer must have a fundamental understanding of how to properly document these types of scenes so that the scene and the evidence are sufficiently illuminated.

The ability to photographically document blood scenes by using a chemiluminescing agent could provide powerful evidence during the investigation.

Documenting bullet trajectories in shooting scenes with lasers has the potential of providing valuable insight during the investigation. The graphical illustration also helps establish the locations of individuals involved in a gunfight, and could help answer important questions as well as aid in the recovery of valuable evidence in these types of investigations.
I. The Digital Evidence Unit provides the following services.

A. Audio Enhancement
   1. Improving the intelligibility of the voice or non-voice signals of an audio recording.

B. Image Enhancement
   1. Improving the clarity of an image or portion of an image.

C. Video Enhancement
   1. Improving the clarity of a video or portion of a video.

D. Audio, Video, and Image Production
   1. Editing Audio, Video, and Image files for presentation.
   2. Redacting Audio, Video, and Image files.
   3. Converting file formats.

E. Field Services
   1. Assistance with extracting files from audio, video, and image equipment in the field

END OF DOCUMENT
I. The Digital Evidence Unit adheres to the Quality Assurance policies in the Division Manual with the following additions and clarifications:

A. Evidence Handling FSD.35

1. Only digital evidence will be accepted for processing.
   a. Peripheral devices (monitors, keyboards, mice, etc.) unrelated to the analysis will not be accepted. Unknown devices may be accepted at the discretion of the Digital Evidence Unit.
   b. Documentation will not be accepted as evidence. Photocopies of field notes, passwords, photographs, etc. may be attached to the service request as administrative records.
   c. Analog evidence will not be accepted (film, photographs, audio or video magnetic tapes, etc.).

2. Agencies may submit non-evidence media as destination media. For example, an agency may request that a copy of a video enhanced by the Digital Evidence unit be placed on a submitted non-evidence USB thumb drive.
   a. Non-evidence destination media shall be labeled as “destination media” followed by the hardware description in LIMS.
   b. Non-evidence media used for one-to-one copies (dd, restoration, etc.) will be wiped prior to use by the Digital Evidence Unit. The submitting agency will be notified of this policy.

3. To protect the integrity of internal computer components (hard drives, RAM, etc.), examiners will take precautions against static electricity.
   a. Examiners may use anti-static mats and wrist straps while handling these items or
   b. Examiners may place these items in anti-static bags while handling them.

B. Test Records FSD.42

1. Digital Evidence Unit test records will include the following additional items:
   a. The equipment used during the examination.
   b. The software and version number used during the examination.
   c. MD5 hash values of the below items. The hash values may be
      i. Pre-examination and post-examination MD5 hash values of forensic images used during an analysis.
      ii. If no forensic image was made, MD5 hash values of the original files and logically copied files.
      iii. MD5 hash values of output files.

2. The following digital files produced during an examination will be archived on the Digital Evidence Network Attached Storage (NAS):
   a. Working files, metadata files, hash value files, log files, and output files.
   b. Copies of the original evidence will not be maintained.

3. Amendments to records
   a. Non-contemporaneous revisions to test records must be recorded in the test record.
   b. Examples:
i. The settings for a filter during an enhancement are finalized on day one. On day two the examiner changes the final settings of the filter. The settings for the filter on day one and day two will be recorded in the test record.

ii. The order of audio filters applied for an enhancement are finalized on day one. On day two the examiner changes the order for the final enhancement. The order of the filters on day one and day two will be recorded in the test record.

C. Test Reports FSD.43

1. The Digital Evidence Unit may produce digital examination results.
   a. Digital examination results will be given to the requesting agency on non-rewritable optical media (preferable) or other digital media at the discretion of the examiner.
   b. A copy of digital examination results will be archived at the laboratory.

2. If an agency supplies destination media, the LIMS description of destination media will be updated after the examination results have been placed on it.

3. Any CD or DVD that has apparent pornographic images of children copied on it as part of the examination will be labeled with the following: “This media may contain contraband and is intended for use by law enforcement in an official criminal investigation. Dissemination of this material may result in a criminal violation.”

4. Agencies may request redacted copies of digital examination results.

5. The administrative review milestone in LIMS reflects both the technical and administrative review of the report.

D. Equipment FSD.33

1. The Digital Evidence Unit will be furnished with equipment for conducting examinations.

2. Equipment will be distinguishable by a combination of make, model, serial number (when available), and laboratory ID. This does not include peripheral devices.

3. If a piece of equipment stops functioning, examiners will notify the Digital Evidence Supervisor for maintenance or replacement.

E. Performance Verification and Calibration FSD.27

1. No equipment in the Digital Evidence unit requires calibration.

2. Equipment used for examinations will undergo performance verification at the following intervals:
   a. Prior to first use
   b. Once per year
   c. After maintenance
   d. After being out of the control of the laboratory, e.g. sent to a vendor for repairs.

3. For computers and stand-alone equipment, a successful Power-On-Self-Test (POST) and successful loading of the operating system will be considered a successful performance verification.

4. For hardware write-blockers, each port will be verified to protect against writing data by using an authorized tool or axiomatic operating system data-writing command (DOS copy, click-and-drag, etc.).

5. Examiners authorized to perform casework may perform performance verifications and validations on equipment related to that type of casework.

F. Equipment and Maintenance Log FSD.33

1. An equipment and maintenance log will be maintained by the Digital Evidence Unit.

2. The logs will contain the date the equipment was put into service, performance verifications, maintenance, and the date the equipment was taken out of service.

3. The logs will also document firmware or BIOS updates with the version number.

4. Only maintenance issues related to critical hardware components should be recorded, i.e. replacing hardware in a computer, or updating the firmware of a write-blocker. Routine exchange of non-critical hardware and changes in software configuration will not be recorded.

G. Technical FSD.17 and Administrative Review FSD.18
1. The Digital Evidence unit will follow the division policies for technical and administrative review with the following additions and clarifications.

2. All reports by the Digital Evidence Unit will be technically reviewed.
   a. The technical reviewer will evaluate the case notes and report to ensure the respective Digital Evidence technical procedures were followed, including the following items when applicable:
      i. The requested work is in the "Request" section of the report (LIMS finding, "Case Synopsis"). All items in the request section must be addressed in the report.
      ii. Original media is write-blocked.
      iii. Hash values of copied files match the original.
      iv. Appropriate enhancements were applied, the settings were recorded, and the enhancements are listed in the report.
      v. Encoding settings for enhanced files are recorded.
      vi. The result of the examination is clearly stated in the report.
   b. If the technical reviewer rejects a technical element (observation, data, or test result), the reviewer will initial and date, and write the reason for the rejection in the notes.
   c. Changes made by the examiner based on the technical review will be initialed and dated.
   d. The completion of the technical review will be documented electronically in LIMS.

3. All reports by the Digital Evidence Unit will be administratively reviewed.

4. Technical and Administrative reviews will include digital examination results.

5. Technical reviews will be documented with the Technical and Administrative Review Checklist (DEF.04).
   Administrative reviews will be documented with the LIMS milestone.

H. Legal Authority
1. A copy of the legal authority must be submitted along with the examination request form when a search is required of the evidence.

I. Technical Lead
1. Roles and Responsibilities: The Technical Leader will work closely with the Unit Supervisor and be responsible for the following duties in the Digital Evidence Unit:
   a. Oversee the technical operations.
   b. Oversee quality assurance.
   c. Evaluate and document the approval of all validations and methods, and approve new or modified procedures.
   d. Review and approve training records and qualifications for new hires.
   e. Review unit procedures.
   f. Review and approve training, quality assurance measures, and proficiency testing program.
   g. A newly appointed Technical Leader will be responsible for reviewing relevant validation studies and methodologies currently used by the Unit.
   h. Perform technical and administrative review of casework.
   i. Assist in assigning and administering proficiency and competency tests.
   j. Assist in technical problem solving.
   k. May recommend suspension of casework for an individual or for the Unit.
2. Qualifications: The Technical Leader must be a full time employee of the Laboratory and have, at a minimum, the following education, experience, and training:
   a. Meet the education requirements of a Criminalist.
   b. A minimum of four years of full-time laboratory experience conducting casework in Digital Evidence.
3. Authorization: The Technical Leader will meet the same requirements for authorization to conduct casework as other examiners.

J. Assuring the Quality of Tests (FSD.29)

1. The Digital Evidence Unit monitors the validity of tests with the following methods:
   a. Functional and intermediate checks of testing equipment
      i. See FSD.33 and DE.03 for more information regarding equipment maintenance testing.
   b. Review of reported results
      i. See FSD.17 for more information regarding analyst responsibilities for checking reported results and conclusions
   c. Technical and administrative review
      i. See the "Technical and Administrative Review" section above for information regarding technical and administrative review.
   d. The data derived from monitoring activities above are documented the following ways:
      i. Equipment Logs.
      ii. Level 2 Corrective Actions.
      iii. Division Level Corrective Actions.
   e. Monitoring
      i. The outcome of monitoring is reviewed, at minimum, annually during an internal audit.
   f. Methods not used to monitor tests:
      i. Currently the Digital Evidence Unit does not use reference materials, quality control materials, alternative instrumentation, control charts, replicate testing, correlating results of different characteristics of a different item, intralaboratory comparisons, or testing of blind samples.
      ii. The unit does not retest retained items as all evidence items are returned to submitting agencies.

K. Ordering Supplies and Services (FSD.30)

1. An individual with budget authority, typically the Chief or a Forensic Manager, will authorize the purchase of supplies and services. Personnel within the Digital Evidence Unit may order supplies according to FSD.30 & CLER.CRIM.12.

2. Supplies and services are designated into two broad categories:
   a. General supplies and services that do not affect the quality of tests, (e.g. office supplies). Requirements in this policy do not apply to these items.
   b. Supplies and services that affect testing and have an impact on the quality of results (e.g. proficiency test providers).

3. The Unit Supervisor or Technical Lead will evaluate external providers and products to ensure their suitability based on one or more of the below criteria. Criteria will be maintained on the Digital Evidence network share.
   a. Proficiency tests purchased from an ISO 17043 supplier
   b. Subcontracting services supplied by an ISO 17025 laboratory
   c. The laboratory has a prior history of satisfactory service with the vendor product.
   d. The equipment meets specified criteria (must be performance verified or validated prior to use).

4. The Unit Supervisor or Technical Lead will monitor external providers to ensure their suitability for use based on the following criteria:
   a. Checking a scope document to ensure the service being requested is within the scope of the vendor or subcontractor.
   b. Checking an accreditation certificate to ensure that accreditation has not lapsed.
   c. Ensuring the product/service is of sufficient quality.
   d. Ensuring the product/service is provided in an acceptable time frame.
e. Ensuring the product/service still meets the Digital Evidence Unit's suitability criteria.

5. Receiving
   a. When supplies are received, the shipping documents must be reviewed and the items inspected to verify that all supplies ordered were received and conform to the Unit's requirements. This is typically done by the analyst who placed the order. All staff in the Digital Evidence Unit may review the order.
   b. If the order does not conform to the Unit's requirements or the correct product was not received, the Unit will not accept the order. The Unit Supervisor or Technical Lead will be notified, and action will be taken.
   c. Once the order is reviewed and accepted, the packaging slip should be signed/dated and forwarded to the Clerical Unit.

6. The Digital Evidence Unit will communicate the following to external providers:
   a. Products to be provided
   b. Acceptance criteria
   c. Competence, including required qualifications of personnel

END OF DOCUMENT
I. Examiners must use approved equipment during examinations. Equipment includes hardware devices (computer workstations, write-blockers, stand alone imaging devices) used to access media (hard drives, SD cards, CDs) and software (forensic imaging software, Photoshop) used to access media.

A. The Digital Evidence Unit will maintain an electronic list of approved equipment.
   1. The equipment list will minimally contain the tool name, manufacturer, version, validation or performance verification results, approval date, and approving authority.
   2. The equipment list will describe the training requirements for equipment as designated by the Technical Lead or Supervisor.
   3. Examiners are required to be authorized to use equipment prior to using the equipment in casework. Equipment authorization will be documented with the Tool Authorization Form (DEF.03).

B. Validations and performance verifications.
   1. Commercial, off-the-shelf equipment (hardware and software) are considered validated and will be performance verified prior to use in casework.
   2. Custom software will be validated prior to use. Custom software includes macros, scripts, or batch files that use custom calculations. Custom software does not include macros, scripts, or batch files without custom calculations or settings built into commercial software.

C. Deviations from the approved equipment list
   1. In exigent circumstances, the Digital Evidence Supervisor or Manager may approve a deviation from the approved tool list.
   2. The deviation and approval will be documented in the case record.
   3. A validation or performance verification of the deviation tool should be performed within 60 days of the tool usage.

END OF DOCUMENT
I. The Digital Evidence Unit follows the Forensic Services Division Evidence Field Services policy (CS.01) with the following additions and clarifications.

A. The Digital Evidence Unit is available for field services in acquiring audio, video, and image evidence. The Digital Evidence Unit will not assist with on-site forensic imaging or computer triage.

1. A copy of the legal authority will be provided to the Digital Evidence Unit by the agency with the service request.

2. Agencies will notify the Digital Evidence Unit with as much time as possible prior to the date of the search warrant service.

3. Agencies will provide as much background information on the audio, video, image, or computer equipment to the Digital Evidence Unit as possible.

END OF DOCUMENT
I. Purpose
   A. To document the physical condition of evidence.
   B. To properly catalog all devices and media.

II. Scope
   A. This procedure applies to all evidence submitted to the Digital Evidence Unit.

III. Limitations
   A. Some hardware may be dangerous, damaged, or too complicated to disassemble and reassemble.
   B. The examiner shall determine if disassembly is necessary.
   C. Not all manufactured characteristics are readily available.

IV. Procedure
   A. Determine if any suspected hardware traps may be in place, such as additional external wires attached to components that may be connected to an alarm or triggering device and take appropriate action.
   B. Mark the evidence in accordance with FSD.35.
      1. If an item is too small to be marked, or may be damaged by marking, the proximal container may be marked instead.
   C. Describe the item.
      1. In general, an item description should include several manufactured characteristics such as make, model, type, storage size, and a unique identifier (e.g. serial number). Other manufactured characteristics may be used, such as carrier branding, interface, physical size, etc. The manufactured characteristics used to describe items are up to the discretion of the examiner.
      2. Custom or home-built computers may be described as Custom Built from Parts (CBP). When necessary, the parts inside the device may be used to describe it.
   D. Document or photograph any wear, damage, or alterations.
END OF DOCUMENT
I. Purpose
   A. To create forensic images of digital media.

II. Scope
   A. Writable digital media from an evidence item (e.g. hard drives from DVR systems, 
      removable media from recording devices) shall be imaged prior to examination when 
      technically possible.
   B. If a submitted item is a copy created by the submitting agency, a forensic image does not 
      need to be created; however, the media should be write-blocked prior to reading the data 
      when possible and working copies of the files must be used for examinations.

III. Limitations
   A. It is not technically possible to capture a write-blocked image of the data for some types of 
      data, such as embedded cell phone storage.
      1. The examiner will document the circumstances if the media cannot be write-blocked 
         during acquisition.
      2. The examiner will document the type of copy and the method used to create copies 
         of files (e.g. logical copies of allocated files made using Windows drag-and-drop).

IV. Procedure
   A. Remove media from hardware when applicable.
   B. Write block the media.
      1. Hardware write-blockers are preferred; however, approved software write-blockers 
         may be used.
   C. Create a forensic image with an approved tool.
      1. For RAID arrays, a copy of the individual drives and a logical copy of the RAID 
         array is recommended because it may not be possible to reconstruct the RAID when 
         the drives are not attached to the RAID controller.
D. Verify the forensic image and original digital evidence media with and MD5 hash when applicable.

1. Verification may not be performed due to exigent circumstances or time constraints.

END OF DOCUMENT
I. Purpose
   A. To improve the visibility of an image or part of an image.

II. Scope
   A. This procedure applies to image files where enhancement has been requested.
   B. The image may be extracted from a video file.
   C. Image enhancements include any process that changes the brightness or color of any area of an image for the purpose of increasing visibility. Enhancements do not include changes to images that do not alter the content or do not increase visibility (e.g. cropping, rotating, labeling, and converting file types). See DE.10 Data Editing/Conversion for non-enhancement editing procedures.

III. Limitations
   A. It is not always possible to improve the visibility of an image or part of an image. Many factors may limit the ability to improve visibility, including noise, not enough resolution, not enough contrast, overexposure, underexposure, etc.
   B. Due to the numerous variables involved with computers, monitors, and lighting conditions, viewing images on equipment other than the examiner's equipment may not accurately reflect the examiner's enhancement.
   C. All enhancements are intended for digital output and viewing. Prints of enhanced images may not accurately reflect the digital output.

IV. Procedure
   A. All enhancement procedures will be done on working copies of the evidence.
   B. Preparing files:
      1. If a file must be extracted from another file (e.g. a proprietary player, or a single frame from a video), record the extraction steps.
      2. If a file must be converted due to software compatibility, record the conversion steps.
   C. Review the submitted image to locate the pertinent areas based on the request.
   D. Evaluate the pertinent areas and note the factors detrimental to the visibility.
1. If the image file is determined to be unsuitable for enhancement, record the observations for this conclusion.

E. Applying, evaluating, and adjusting filters:

1. Apply the appropriate filter based on the evaluation and request.
2. Evaluate the filter's effects.
3. Adjust the filter to the optimal settings (based on the examiner's subjective opinion).
4. Add, evaluate, and adjust more filters as appropriate.
5. Record the final settings and the effect of each filter for the filters used to create the final enhanced file. Screenshots of filter settings from the software are encouraged.
6. For files where the visibility cannot be increased, record the filters and settings used with the best results, and record the observations of why the visibility could not be increased.
7. The filter settings and observations of the filters' effects are the basis for the examiner's opinion.
8. When possible, the working copy of the video with non-destructive editing states should be saved with the case record.
9. Save the enhanced file to an uncompressed image format. Use a new file name that indicates that it is the enhanced version.

V. Reporting Results, Interpretations, and Opinions

A. **Positive** - the examiner applied filters to the file and the requested image was enhanced.

1. Reporting: state the image was enhanced and list names of the filters used for the enhanced file.
2. Suggested statements:
   a. "I enhanced the image file with Camera RAW and smart sharpen filters."

B. **Negative** - the examiner attempted to enhance the file with filters, but the requested area's visibility could not be increased.

1. Reporting: state the names of the filters with the best results. Filters with no results do not need to be listed.
2. Suggested statements:
   a. "I attempted to enhance the image file with Camera RAW and smart sharpen filters, but I was unable to enhance the visibility of the requested license plate due to the low resolution of the image."
   b. "I attempted to enhance the video file with Camera RAW and smart sharpen filters, but I was unable to enhance the visibility of the requested subject; the subject was too underexposed."

C. **Inconclusive** - the examiner applied filters to the requested image, but was unable to determine if the requested visibility was increased.

1. Reporting: state the names of the filters used for the enhanced file.
2. Suggested statements:
   a. "I enhanced the video file with Camera RAW and smart sharpen filters. I was unable to determine if the visibility of the subject was increased."

D. **Unsuitable** - the submitted file could not be examined, or the requested area was not present.
   1. Reporting: state the reasons the file was unsuitable for enhancement.
   2. Suggested statements:
      a. "The submitted file could not be opened or converted to a readable format. No enhancement was possible."
      b. "The suspect's face was turned away from the camera in the submitted file. No enhancement of the suspect's face was possible."

END OF DOCUMENT
I. Purpose
A. To improve the intelligibility of the voice or non-voice signals of an audio recording. Audio enhancement includes playing the recording, analyzing it, determining the most effective filtering, and producing enhanced copies.

II. Scope
A. This procedure applies to audio recordings where enhancement of a signal has been requested.
B. Audio enhancements include any process that changes the volume of any section of an audio recording for the purpose of increasing intelligibility. Enhancements do not include changes to audio files that do not alter the content or do not increase intelligibility (e.g. splitting channels or converting file types). See DE.10 Data Editing/Conversion for non-enhancement editing procedures.

III. Limitations
A. It is not always possible to improve the intelligibility of a signal, particularly in recordings with a poor signal-to-noise ratio or severe distortion.
B. Results may not accurately reflect the examiner’s enhancement when listened to on equipment other than the examiner’s equipment. For example, low-quality headphones may not reproduce the same subtle audio signals as the examination equipment.

IV. Procedure
A. All enhancement procedures will be done on working copies of the evidence.
B. Preparing files:
   1. If a file must be extracted from another file (e.g. a proprietary player or an audio channel from a video file), record the extraction steps.
   2. If a file must be converted due to software compatibility, record the conversion steps.
C. Review the submitted files to locate the pertinent segments based on the request. Files may be reviewed with a combination of visual (spectral waveform) and audible review.
D. Evaluate the requested segments and record what the detrimental factors may be, such as broadband noise, wind, low signal-to-noise ratio, low volume of voices, electrical
interference, etc.

1. If the audio file is determined to be unsuitable for enhancement, record the observations for this conclusion.

E. Applying, evaluating, and adjusting filters:

1. Apply the appropriate filter based on the evaluation and request.
2. Evaluate the filter's effects audibly and visually.
3. Adjust the filter to the optimal settings (based on the examiner's subjective opinion).
4. Add, evaluate, and adjust more filters as appropriate.
5. Record the final settings and the effect of each filter for the filters used to create the final enhanced file. Screenshots of filter settings from the software are encouraged.
6. For files where the intelligibility cannot be increased, record the filters and settings used with the best results, and record the observations of why the intelligibility could not be increased.
7. The filter settings and observations of the filters' effects are the basis for the examiner's opinion.
8. When possible, the working copy of the file(s) with non-destructive editing states should be saved with the case record.

F. Save the enhanced recording to a new file with a name indicating that it is the enhanced version.

G. Copy the enhanced file to the destination media for the requesting agency and perform an MD5 hash check on the original and copied files.

V. Reporting Results, Interpretations, and Opinions

A. Positive - the examiner applied filters to the file and the requested signal was increased.

1. Reporting: state the audio was enhanced and list names of the filters used for the enhanced file.
2. Suggested statements:
   a. "I enhanced the audio file with levels, de-hum, and spectral de-noise filters."

B. Negative - the examiner attempted to enhance the file with filters, but the requested signal could not be increased.

1. Reporting: state the names of the filters with the best results. Filters with no results do not need to be listed.
2. Suggested statements:
   a. "I attempted to enhance the audio file with levels, de-hum, and spectral de-noise filters, but I was unable to enhance the intelligibility of the apparent voice due to the low signal-to-noise ratio."
   b. "I attempted to enhance the audio file with equalizer and dialogue-isolate filters, but I was unable to enhance the intelligibility of the apparent conversation due severe distortion."
C. **Inconclusive** - the examiner applied filters to the requested signal, but was unable to determine if the requested signal was increased.

1. Reporting: state the names of the filters used for the enhanced file.
2. Suggested statements:
   a. "I enhanced the audio file with levels, de-hum, and spectral de-noise filters. I was unable to determine if the requested signal was increased."

D. **Unsuitable** - the submitted file could not be examined, or the requested signal was not present.

1. Reporting: state the reasons the file was unsuitable for enhancement.
2. Suggested statements:
   a. "The requested video file did not have an audio channel to enhance."
   b. "At the requested time of the audio file (1:42min), no voice signal was present. No enhancement was possible."

**END OF DOCUMENT**
I. Purpose
   A. To improve the visibility of a video or part of a video.

II. Scope
   A. This procedure applies to video files where enhancement has been requested.

   B. Video enhancements include any process that changes the brightness, color, or clarity of any area of an video for the purpose of increasing visibility. Enhancements do not include changes to images that do not alter the content or do not increase visibility (e.g. cropping, rotating, labeling, and converting file types). See DE.10 Data Editing/Conversion for non-enhancement editing procedures.

III. Limitations
   A. It is not always possible to improve the visibility of a video or part of a video. Many factors may limit the ability to improve visibility, including noise, not enough resolution, not enough contrast, overexposure, underexposure, etc.

   B. Due to the numerous variables involved with computers, monitors, and lighting conditions, viewing videos on equipment other than the examiner's equipment may not accurately reflect the examiner's enhancement.

IV. Procedure
   A. All enhancement procedures will be done on working copies of the evidence.

   B. Preparing files:
      1. If a file must be extracted from another file (e.g. a proprietary player), record the extraction steps.
      2. If a file must be converted due to software compatibility, record the conversion steps.

   C. Review the submitted video to locate the pertinent areas based on the request.

   D. Evaluate the pertinent segments and note the factors detrimental to the visibility of the areas, such as compression artifacts, long shutter speed/motion, over or under exposure, etc.
1. If the video file is determined to be unsuitable for enhancement, record the observations for this conclusion.

E. Based on the request or upon discretion of the examiner, images from the video may be extracted and enhanced instead of video. Enhancement of images from videos follows the image enhancement policy (DE.07)

F. Applying, evaluating, and adjusting filters:
   1. Apply the appropriate filter based on the evaluation and request.
   2. Evaluate the filter's effects.
   3. Adjust the filter to the optimal settings (based on the examiner's subjective opinion).
   4. Add, evaluate, and adjust more filters as appropriate.
   5. Record the final settings and the effect of each filter for the filters used to create the final enhanced file. Screenshots of filter settings from the software are encouraged.
   6. For files where the visibility cannot be increased, record the filters and settings used with the best results, and record the observations of why the visibility could not be increased.
   7. The filter settings and observations of the filters' effects are the basis for the examiner's opinion.
   8. When possible, the working copy of the video with non-destructive editing states should be saved with the case record.

G. Rendering the enhanced video:
   1. The video render settings are at the discretion of the examiner and based on the request and original video parameters.
   2. Record the video settings and render the video.
   3. Name the enhance file with a name indicating that it is the enhanced version.
   4. Review the enhanced video to confirm the enhancements were not significantly affected by the rendering.

H. Copy the enhanced file to the destination media for the requesting agency and perform an MD5 hash check on the original and copied files.

V. Reporting Results, Interpretations, and Opinions

A. Positive - the examiner applied filters to the file and the requested video was enhanced.
   1. Reporting: state the video was enhanced and list names of the filters used for the enhanced file.
   2. Suggested statements:
      a. "I enhanced the video file with levels, shadow/highlight, and unsharp mask filters."

B. Negative - the examiner attempted to enhance the file with filters, but the requested area could not be increased.
1. Reporting: state the names of the filters with the best results. Filters with no results do not need to be listed.

2. Suggested statements:
   a. "I attempted to enhance the video file with levels, shadow/highlight, and unsharp mask filters, but I was unable to enhance the visibility of the requested license plate due to the low resolution of the video."
   b. "I attempted to enhance the video file with levels, shadow/highlight, and unsharp mask filters, but I was unable to enhance the visibility of the requested subject; the subject was too underexposed."

C. **Inconclusive** - the examiner applied filters to the requested video, but was unable to determine if the requested visibility was increased.

   1. Reporting: state the names of the filters used for the enhanced file.
   2. Suggested statements:
      a. "I enhanced the video file with levels, shadow/highlight, and unsharp mask filters. I was unable to determine if the visibility of the subject was increased."

D. **Unsuitable** - the submitted file could not be examined, or the requested area was not present.

   1. Reporting: state the reasons the file was unsuitable for enhancement.
   2. Suggested statements:
      a. "The submitted video stopped playing after 10 seconds. The requested time could not be viewed. No enhancement was possible."
      b. "At the requested time of the video file (1:42min), the requested vehicle was not present. No enhancement was possible."

END OF DOCUMENT
I. Purpose
   A. Data editing and conversion of audio, video, or images related to investigations or court without enhancement. Requests may include, but are not limited to:
      1. Converting a video to a different wrapper (file extension)
      2. Extracting a short clip or screenshots from a video
      3. Editing multi-camera videos to single-shot videos
      4. Creating a “wanted” video for social media
      5. Redaction (obscuring faces, voices, etc.)
      6. Combining multiple files of a similar type into a single file

II. Scope
   A. Data Editing/Conversion requests may be performed on submitted Audio, Video, or Image evidence.

III. Limitations
   A. Data Editing/Conversion requests do not include any process that changes an audio, video, or image file for the purpose of increasing visibility or intelligibility (enhancements).
   B. Data Editing/Conversion requests may be combined with enhancement or analysis requests (e.g. demultiplexing a video followed by enhancement). Combined requests will be categorized as an enhancement request.

IV. Procedure
   A. All production procedures will be done on working copies of the evidence.
   B. Review the submitted media to locate the pertinent areas based on the request.
   C. Use software tools to produce the requested result.
      1. Document the tool settings used to produce the final result. Screenshots of tool settings are encouraged. Full command line arguments are required for command line tools and batch files.
2. Some editing requests may be complex; summaries of the procedure are sufficient if they are in the correct order and have enough detail for another competent examiner to replicate the results.

3. Record the settings used for encoding video and audio files.

4. Audio and image files will be saved as an uncompressed format, unless requested otherwise.

5. Video files will be saved in a compressed format. The examiner will review the video to ensure no significant changes were introduced due to the compression.

V. Reporting Results, Interpretations, and Opinions

A. **Positive** - the examiner created the requested result.

1. Reporting: state the request was completed and the tools used.

2. Suggested statements:

   a. "I converted the 243 .dav files to one .avi file using FFMPEG."

   b. "I created a linear video of the requested vehicle from the four submitted surveillance videos using Adobe Premiere Pro."

B. **Negative or Unsuitable** - the examiner attempted the request but could not complete it, or the submitted files were unsuitable. Include any tools that were used.

1. Reporting: state the request could not be completed and the reasons why.

2. Suggested statements:

   a. "I could not extract clips of the submitted video. The video was embedded in a proprietary player and did not have an export function."

   b. "I could not convert the submitted video files. The videos were encoded with an unknown CODEC and could not be converted."

C. **Inconclusive** - the examiner created the requested result, but was unable to confirm the results. Include any tools that were used.

1. Reporting: state the request was completed, the tools used, and the reason the results could not be confirmed.

2. Suggested statements:

   a. "I converted the video 360-degree VR video format with Adobe Premiere Pro, but the laboratory does not have VR hardware to confirm the results. Please resubmit the video if any errors are found."

END OF DOCUMENT
I. **Policy:** Non-conforming work is an incident or problem encountered in casework, proficiency testing, testimony or the quality assurance program. When non-conforming work is encountered in the Digital Evidence Unit, action is taken to address the non-conformity.

A. The level of corrective action taken for any non-conformity is dependent on the type of incident or problem and its severity. In general, the greater the severity or its substantive nature, the higher the level of corrective action taken. The appropriate QA Action-Correction (QAC) taken is based on the type of non-conformity, the magnitude and scope of the problem, and whether it is a single event or repetitive. Types of non-conforming work and their corresponding level of corrective action are described below.

B. **QAC-1 (most significant):** Quality system non-conformities are discrepancies or incidents that raise immediate concern regarding the overall quality of the unit's work product or the competency of an analyst. These non-conformities rise to the level of significant concern for the quality system or a systemic problem within the Unit.

   1. Quality system non-conformities include but are not limited to:
      a) Erroneous or falsified tests, results, conclusions, records, or testimony
      b) Improper or deliberate misuse of methods, equipment, or evidence
      c) Audit findings
      d) Unsuccessful proficiency test
      e) Repeated QAC-2 errors

   2. A significant quality system non-conformity requires documentation of the corrective action per Division policy and procedure. See [FSD.15, QA.18, FSDF.06, FSD.44](#) for more information about the evaluation of significance, required elements of a corrective action, documentation and retention of corrective action records.

C. **QAC-2 (somewhat significant):** These discrepancies or incidents are not serious enough to cause immediate concern for the quality system or the Unit's overall work product, but do have an isolated effect on the work product, tend to be individual events, and are addressed on a case-by-case basis. These non-conformities are
typically detected prior to the release of results and conclusions, and have the potential to be remediated.

1. Level 2 incidents include but are not limited to:
   a) Improper use of methods or equipment when it is demonstrated their use did not impact the quality of work or validity of the result.
      (1) using equipment that has not been properly checked
   b) Procedure not being followed when it is demonstrated that its use did not impact the quality of work or validity of the result
   c) Improper conclusions or lack of documentation of conclusions
   d) Repeated QAC-3 errors

2. Documentation of a QAC-2 non-conformity will be maintained within the unit and will be evaluated by the supervisor. The documentation should include the following applicable sections:
   a) An explanation of the error or non-conformity. (What is the problem?)
   b) An evaluation of the impact on casework, equipment, etc. (How significant is the problem?)
   c) An explanation of how the error on non-conformity occurred. (Why did it happen?)
   d) An explanation of the action taken to correct the error or non-conformity. (What was done to correct the problem?)
   e) A summary of any monitoring or follow-up. (Was the correction effective?)

D. QAC-3 (least significant): Discrepancies or incidents that do not affect the significance of a conclusion, a reported test result, or impact on the quality system, are unlikely to recur, are not systemic, and do not affect the fundamental reliability of the work product.

1. Examples of a QAC-1 non-conformity include, but are not limited to:
   a) transcription errors: switching the month and day when documenting the date of an exam step
   b) grammatical or typographical errors: spelling or grammar mistakes in reports or notes, wrong agency case number or requester in LIMS, etc.
   c) omission errors: omitting relevant information (e.g. the data storage size of a hard drive)
d) When brought to the analyst's attention, this type of non-conformity is typically corrected immediately by the analyst. A record of the correction is captured when the analyst initials and dates the correction as outlined in the Case Record Division Policy FSD.42 and the Test Reports Policy, FSD.43.
I. Common Abbreviations
Additional abbreviations for commonly used terms in the forensic science community may not be listed.

ADSL - Asymmetric Digital Subscriber Line
AGP - Accelerated Graphics Port
AMD - Advanced Micro Devices
ASCII - American Standard Code for Information Interchange
ASIC - Application Specific Integrated Circuit
AT - Advanced Technology Attachment
ATI - ATi Technologies Inc.
ATX - Advanced Technology Extended
AVI - Audio Video Interleaved
BIOS - Basic Input Output System
BMP - Bitmap
BNC - Barrel Nut Connector
bps - Bits per second
Bps - Bytes per second
CAS - Column Address Signal
CD - Compact Disk
CDR - Compact Disk Recorder
CDRW - Compact Disk Re-Writer
CD-ROM - Compact Disk - Read Only Memory
CF - Compact Flash
CLI - Command Line Interface
CMOS - Complementary Metal Oxide Semiconductor
CPU - Central Processing Unit
CRT - Cathode Ray Tube
CSV - Comma Separated Values
DAT - Digital Audio Tape
DDR - Double Data Rate
DDR-SDRAM - Double Data Rate - Synchronous Dynamic Random Access Memory
DIMM - Dual Inline Memory Module
DNS - Domain Name System
DOS - Disk Operating System
DPI - Dots Per Inch
DRAM - Dynamic Random Access Memory
DSL - Digital Subscriber Line
DVD - Digital Versatile Disc
DVD-RAM - Digital Versatile Disk - Random Access Memory
DVR - Digital Video Recorder
ECC - Error Correction Code
ECS - Elitegroup Computer Systems
EDO - Extended Data Out
EEPROM - Electrically Erasable Programmable Read-Only Memory
EPROM - Erasable Programmable Read-Only Memory
eSATA - External SATA
FAT - File Allocation Table
FDC - Floppy Disk Controller
FDD - Floppy Disk Drive
FPS - Frame Per Second
FPU - Floating Point Unit
FSAA - Full Screen Anti-Aliasing
FSIZE - Front Side Bus
FTP - File Transfer Protocol
GB - Gigabytes
GDI - Graphical Device Interface
GHz - GigaHertz
GIF - Graphics Interchange Format
HDD - Hard Disk Drive
HSF - Heatsink-Fan
I/O - Input/Output
IC - Integrated Circuit
IDE - Integrated Drive Electronics
IRQ - Interrupt Request
ISA - Industry Standard Architecture
ISO - International Standards Organization
JPG - Joint Photographic Experts Group
LAN - Local Area Network
LCD - Liquid Crystal Display
LED - Light Emitting Diode
MAC - Media Access Control
MB - MotherBoard or Megabyte
MBR - Master Boot Record
MHz - MegaHertz
microSD - Micro Secure Digital
MIPS - Million Instructions Per Second
MMX - Multi-Media Extensions
MPEG - Motion Pictures Experts Group
NAS - Network Attached Storage
NAT - Network Address Translation
NEC - NEC Corporation
NIC - Network Interface Card
NTFS - NT File System
OC - Overclock
OEM - Original Equipment Manufacturer
OS - Operating System
PC - Personal Computer
PCB - Printed Circuit Board
PCI - Peripheral Component Interconnect
PCIe - PCI Express
PDA - Personal Digital Assistant
PCMCIA - Peripheral Component Microchannel Interconnect Architecture  
PGA - Professional Graphics Array  
PnP - Plug 'n Play  
POST - Power On Self Test  
PPPoA - Point-to-Point Protocol over ATM  
PPPoE - Point-to-Point Protocol over Ethernet  
PS/2 - Personal System/2  
PSU - Power Supply Unit  
RAID - Redundant Array of Inexpensive Disks  
RAM - Random Access Memory  
RAMDAC - Random Access Memory Digital Analog Convertor  
RDRAM - Rambus Dynamic Random Access Memory  
RGB - Red, Green, Blue  
ROM - Read Only Memory  
RPM - Revolutions Per Minute  
SATA - Serial Advanced Technology Attachment  
SCA - SCSI Configured Automatically  
SCSI - Small Computer System Interface  
SD - Secure Digital  
SDRAM - Synchronous Dynamic Random Access Memory  
SECC - Single Edge Contact Connector  
SODIMM - Small Outline Dual Inline Memory Module  
SOHO - Small Office Home Office  
SPARC - Scalable Processor Architecture  
SRAM - Static Random Access Memory  
SSD - Solid State Disk  
SSE - Streaming SIMD Extensions  
SVGA - Super Video Graphics Array  
S/PDIF - Sony/Philips Digital Interface  
TB - Terabytes  
TEC - Thermoelectric Cooler  
TIFF (TIF) - Tagged Image File Format  
UART - Universal Asynchronous Receiver/Transmitter  
USB - Universal Serial Bus  
UTP - Unshieled Twisted Pair  
VCD - Video CD  
VPN - Virtual Private Network  
WAN - Wide Area Network  
WAP - Wireless Access Point  
WiFi - Wireless Fidelity  
WLAN - Wireless LAN  
WMA - Windows Media Audio  
WMV - Windows Media Video  
WYSIWYG - What You See Is What You Get  
XGA - Extended Graphics Array  
XMS - Extended Memory Specification  
XT - Extended Technology

II. Digital Evidence Unit Abbreviations

CBP – Custom Built from Parts  
Comm Log – Communications Log  
CP – Child Pornography
CVIP – Child Victim Identification Program
FFT – Fast Fourier Transform
FTK - (Access Data) Forensic Tool Kit
KFF – Known File Filter
MD5 – Message Digest algorithm 5
MISC – miscellaneous
PP - (Adobe) Premier Pro
PS - (Adobe) Photoshop
SHA1 – Secure Hash Algorithm (160-bit)
SHA256 – Secure Hash Algorithm (256-bit)
SN or S/N – Serial Number
TSBPB – tape-sealed brown paper bag
TSCB – tape-sealed cardboard box
TSCE – tape-sealed coin envelope
TSME – tape-sealed manila envelope
TSPB – tape-sealed plastic bag
TSSB – tape-sealed slide box
TSSE – tape-sealed soil envelope
VC - Video Cleaner
VM – Virtual Machine

END OF DOCUMENT
I. The Digital Evidence Unit training program will be used to train examiners in the knowledge, skills, and abilities required to perform digital evidence analysis.

II. Introduction

A. New employees undergo a Forensic Services Division (FSD) orientation program prior to the commencement of Digital Evidence training. The FSD orientation covers several topics including safety, ethics, and quality assurance. Refer to FSDF.01 for a list of topics covered under orientation.

B. The Forensic Services Division Digital Evidence Unit training manual is designed to provide training in the fields of digital evidence analysis.

C. Digital evidence is a highly technical and rapidly changing field. Trainees are not expected to memorize the vast quantity of computer knowledge, but instead be able to research, find, and apply the information to casework.

D. Job titles held within the Forensic Services Division are listed within (FSD.03). The minimum qualification for an analyst to perform enhancements, forensic imaging, and field services is a bachelor's degree in a natural science and successful completion of the appropriate training modules.

E. Working within Digital Evidence requires specialized training and an aptitude for the discipline. Unlike many fields of scientific study, the skills and aptitudes that are requisite for examiners cannot be fully addressed in the academic environment. Degrees and coursework in computer science, computer programming, and related fields are not prerequisites for an assignment to the Digital Evidence Unit. A strong interest in the field and a desire to learn coupled with a strong investigative curiosity are indicators of a successful examiner.

F. Examiners will be warned that working in the field of digital evidence will involve material that is highly offensive, such as sexually explicit erotica, bestiality, graphically violent images, child pornography, etc.

III. Training Coordination

A. The training program will be implemented by the digital evidence supervisor and a training coach.

B. The digital evidence supervisor oversees the training program including scheduling classes, acquiring equipment, and coordinating the training program with the coach.
C. A training coach will be assigned to each trainee. A training coach is an experienced examiner who will mentor their trainee through the training program. They may be responsible for in-house training, demonstration, supervised practice casework, and other duties that benefit the trainee’s progress. The training officer will maintain the trainee’s progress (form DET.02) and update the Digital Evidence Supervisor of the trainee’s progress.

IV. Trainee Expectations

A. Complete each training module on a schedule determined by the training coach and supervisor. The entire training program will take approximately six months, with adjustments due to training and casework in other units.

B. Actively participate in discussions related to each training module.

C. Participate in professional discussions with any member of the Digital Evidence Unit.

D. Maintain training notes and records of training.

E. Communicate any feedback or concerns with the training to the training coach or supervisor.

V. Training Coach Expectations

A. Work with the trainee and Digital Evidence Supervisor to create a schedule to complete the training program.

B. Actively participate in discussions related to each training module with the trainee.

C. Periodically review the trainee’s Digital Evidence Training Record (DEF.02) to ensure accuracy.

D. Teach the trainee part or all of a training module.

E. Demonstrate casework to the trainee.

F. Communicate any feedback or concerns with the training to the trainee or supervisor.

VI. Training Modules

A. The Objectives outline the purpose of each study segment.

B. The Study Questions have a number of purposes:

1. To provide the trainee a guide for the depth of knowledge expected for each of the topics.

2. To promote active discussions between the coach and trainee using the questions as a starting point.

3. To prepare the trainee for potential expert testimony questions.

C. Answers to questions may be written or verbal as determined by the coach, and will be discussed with between the coach and trainee.
D. **Practical Exercises** are designed to provide the trainee firsthand experience with the main concepts of each study segment.

E. **Court and Legal Procedures** - Training modules include courtroom procedures, testimony, and legal information as it relates to each training module. Moot court may be combined for several modules when appropriate and will be noted in the training record.

F. **Suggested Reading and References** list some reading and reference material that should be read to successfully complete the study segment. Website locations may have changed since the module was created; trainees should attempt to find the new website location and inform the Digital Evidence Supervisor.

G. **Classes** – Training received out of the laboratory may meet training module goals. The supervisor may approve some or all of a training module after reviewing the content of the training. Practical, written, or oral technical exams may also be administered.

VII. **Training Documentation**

A. Training will be documented on the Digital Evidence Training Record (DEF.02). Each section of a training module will be initialed and dated by the trainee and coach. At the completion of a training module, the entire module will be reviewed and signed by the trainee, coach, and supervisor. The trainee will also maintain their training record in LIMS in accordance to FSD.21.

VIII. **Evaluating the Effectiveness of Initial and Ongoing Training**

A. The effectiveness of initial and ongoing training will be monitored and evaluated by the Digital Evidence Unit Supervisor and Technical Lead in one or more of the following ways:

   a. Requiring a teach-back or feedback from the analyst attending training.

   b. Evaluating yearly proficiency test results.

   c. 100% Technical and Administrative review of casework.

   d. Court testimony monitoring (FSD.26)

   e. Rotational presentations of various topics to the unit by staff.

IX. **Training of Experienced Personnel**

A. The Digital Evidence Supervisor will assess the qualifications of newly hired experienced examiners and may approve the completion of a training module.

B. Methods of verifying the completion of prior training may include, but is not limited to, reviewing the individual's job application, statement of qualifications, transcripts or prior training records.

C. Practical, written, or oral technical exams may also be administered.

D. Experienced examiners are required to pass a competency test prior to performing casework.

X. **Successful Completion of Competency Tests**

A. After completion of the training the trainee will be given a competency test. Upon passing the competency test, the trainee will be granted authorization to perform casework (DEF.01). The supervisor should monitor the new analyst's casework following
authorization. In addition, the supervisor, coach, or another qualified examiner should observe the newly qualified examiner in court testimony.

XI. Continuing Education

A. Digital Evidence is a difficult discipline in which to maintain up-to-date information. New hardware, software, operating systems, media, parts and devices are constantly introduced by the technology industry.

B. Digital Evidence Examiners should participate in continuing education to keep up with the rapidly evolving discipline. Examiners can keep up by reading technology websites and blogs.

C. Formal training classes on forensics topics will be taken as outlined in QA.12.

XII. Training Summary

![Prerequisites Diagram]

The hardware, forensic imaging, and field services training modules must be completed prior to any other training module.

- Hardware Training Module
- Forensic Imaging Training Module
- Forensic Imaging Competency Test
- Field Services Training Module

Image, Video, Audio Enhancement and Field Services may be completed in any order after the prerequisites.

![Image and Video Diagram]

Image and Video enhancement are very similar and the training modules are recommended to be completed concurrently.

- Image Enhancement Training Module
- Image Enhancement Competency Test
- Video Enhancement Training Module
- Video Enhancement Competency Test

![Audio Diagram]

Audio enhancement is unrelated to Image and Video enhancement, and may be completed at any time.

- Audio Enhancement Training Module
- Audio Enhancement Competency Test

END OF DOCUMENT
The hardware module is designed to familiarize the trainee with computer and electronics hardware commonly encountered in digital evidence examinations and field work. The focus of the training is to be able to figure out what an item is through research, rather than memorization.

I. Objectives: Research and become familiar with the topics below. The target audience of the hardware should be consumer to small business level – common hardware found in the field and submitted for evidence. Specialized hardware for professionals, audiophiles, or enterprise settings are not in the scope of this training. The overall objective for this module is to learn where data can be stored.

A. Common computer components
   1. Chassis (desktop, server, laptop, all-in-one, etc.)
   2. Motherboard
   3. Hard drives
   4. Optical drives
   5. Ports, plugs, and cables you can find in a computer
   6. Expansion slots and expansion cards (laptop and desktop)
   7. RAM
   8. CPU and CPU sockets
   9. Heat sinks and fans
   10. Power Supply
   11. Peripheral devices

B. Storage media
   1. Hard drives (internal and external)
   2. Solid State Drives
   3. RAID
   4. NAS, SAN, cloud drives
   5. USB thumb drives
6. Flash storage media (CF, SD, microSD, etc.)
7. Optical disks
8. Magnetic tape storage
9. Legacy disks
10. Ports, plugs, and cables related to storage media

C. **Learn how to remove media from a various computer hardware chassis.**

D. **Build a computer from parts.**
   1. The goal of this section is building a custom built from parts (CBP) computer, as well as understanding what each part does and how it interacts with the rest of the computer.

E. **Networking hardware and their uses**
   1. NIC
   2. Cables
   3. Hubs, switches, etc.
   4. Wireless devices
   5. Home network devices (router, cable modem, DSL)

F. **Display hardware and connections**
   1. Monitors, projectors
   2. Various display cables
   3. Analog vs. Digital
   4. Monitor vs. all-in-one

G. **Audio hardware and connections**
   1. Receivers
   2. Speakers, headphones
   3. Microphones
   4. Audio cables

H. **Recording devices**
   1. Cameras
   2. Webcams
   3. Microphones
   4. Surveillance cameras

II. **Study Questions**

A. **Common computer components**
1. What is a motherboard?
2. As a consumer, list some pros and cons between SSDs and platter hard drives.
3. Do peripheral devices normally contain storage media?
4. Name three different ways to connect an SSD to a motherboard.
5. Come up with an analogy to explain how the components of a computer work with each other.
6. What are some methods for identifying a port or plug?
7. How do you differentiate between a USB thumb drive and a wireless USB dongle? What should you do if you’re not sure?

B. Storage media

1. Name some common internal storage media used in computers.
2. How does a platter hard drive work? What are some ways it can break?
3. What is the purpose of a RAID?
4. Describe the method for storing data in solid state and magnetic media.
5. How do you access the common administrative interface for a home NAS?
6. Can NAS devices run software? What kind? What complications can this create?
7. List some problems with optical media, specifically when dealing with rewritable discs.
8. What is the TRIM command?
9. Unlike other storage media, what is the major problem with reading data off of a magnetic tape?

C. Removing media from devices

1. What are some search terms to use to find guides on removing hard drives?
2. What is the best resource for Apple product take down guides?
3. What are some options if removing media is difficult, time consuming, or may damage the device?
4. How do you remove the disc in an optical drive if the computer or drive will not power on?

D. Computer building

1. You turn a computer on an it starts beeping. What is going on?
2. Can you build a CBP Mac?
3. What are three methods for cooling a CPU?
4. List some issues with buying and installing RAM.
5. What is thermal paste used for?
6. List the minimum parts required for a working computer running an operating system.

7. Does every computer need a removable video card?

8. What are fans for?

9. What is a computer POST?

10. Detail the boot process of a computer.

E. Networking hardware

1. What are the two common networking devices found in a home? What does each one do? Can they be combined into one device?

2. How can a person hide network connected storage media in their house?

3. You are assisting with serving a search warrant at a house. The wireless network has no password. What are some complications for the investigation with a wireless network without a password?

F. Display hardware

1. What is the primary difference between an analog signal and a digital signal?

2. Why does a digital signal produce a better image?

3. What should you look for to determine if a monitor is a display vs. an all-in-one?

4. How can a monitor be directly connected to storage media?

G. Audio hardware

1. What should you look for to see if audio hardware has internal or external media storage?

2. Can you store more than audio data?

3. Is speaker wire analog or digital?

H. Recording devices

1. List some storage media for recording devices.

2. Can you store non-image files on a compact flash card?

3. List useful metadata that may be recorded with photos.

4. Do surveillance cameras normally have internal storage? Where is the recorded data stored?

III. Practical Exercises

A. Identify various electronic parts and the components of each. Explain the purpose of each. Name any predecessors or successors to the parts of components.

B. Identify various cables and ports. Explain the purpose of each. Name any predecessors or successors to the parts of components.

C. Build a computer from parts and disassemble it.
D. Install 2-3 operating systems on the computer you just built (each as a clean install).
E. Remove the hard drive from various computers.
F. Discuss the various methods to access a computer’s BIOS.
G. Go to a computer store and look for new hardware and components. Discuss the implications to Digital Evidence.

IV. Court and Legal Procedures
A. The trainee shall receive instruction and training on courtroom procedures, presentation of evidence, and legal procedures. Topics may include: penal codes, statute of limitations, search warrants, subpoenas, discovery, court structure, rules of evidence, voir dire, (expert) witness demeanor and ethics, and observation of testimony.
B. Moot court: The trainee will participate in oral mock testimony that includes direct and cross examination as well as the introduction of evidence/exhibits.
C. Court and Legal Procedures training may be combined for several training modules and will be noted as such in the Digital Evidence Training Record.

END OF DOCUMENT
The Forensic Imaging module is designed to teach the trainee how to create forensic images of electronic media to be used in examinations.

I. Objectives: research and become familiar with the topics below.

A. Evidence Handling and Case Records
B. Approved Tools
C. Logs
D. Case Records (notes)
E. Hardware and software write-blockers
F. Stand-alone imaging devices
G. Create forensic images of media (.E01, mirror)
H. Create forensic images of RAID arrays
I. Hash values and verifying images
J. Access a computer’s hardware settings (BIOS, firmware)
K. Wiping hard drives and other media
L. Restoring images
M. Logical copying

II. Study Questions

A. Hardware and software write-blockers
   1. What is a hardware write-blocker?
   2. How do you confirm a hardware write-blocker is working?
   3. What is a software write-blocker?
   4. What does forensic boot media do?

B. Stand-alone imaging devices
   1. Describe some advantages and disadvantages of stand-alone imaging devices.
2. What are each of the limiting factors that dictate the speed of imaging?

C. Create forensic images of media
   1. What is the purpose of creating a forensic image? What advantage does this have over other forensic fields?
   2. What is an .E01 image?
   3. What is a mirror copy?
   4. What are some advantages to using .E01 images? How is an .E01 image different than a mirror copy? How is it the same?
   5. Do you need to wipe a drive before writing an .E01 image on it? Mirror? Why?
   6. What is a live acquisition?
   7. What are some options if removing media is difficult, time consuming, or may damage the device?
   8. How do you differentiate between a USB thumb drive and a wireless USB dongle? What should you do if you’re not sure?

D. Create forensic images of RAID arrays
   1. What two steps should you do when imaging a RAID array? What order should these steps be done?
   2. What is the difficulty with working on individually imaged hard drives from a RAID?

E. Hash values and verifying images
   1. What is a hash value?
   2. Without using math, describe how a hash value is calculated.
   3. Why does changing a single bit drastically change a hash value?
   4. What is MD5 collision? Why is it not an issue in forensic imaging?
   5. What is a verification hash? What does this tell you?

F. Access a computer’s hardware settings (BIOS, firmware)
   1. What is targeted disk mode and when do you use it?
   2. What is the generic method for accessing the BIOS settings in a PC?
   3. What is dangerous with removing a hard drive from a DVR?

G. Wiping hard drives and other media
   1. What are some physical methods for erasing data on a hard drive?
   2. What is the forensic method for erasing a hard drive, and why do we use it?

H. Restoring images
   1. Why do you need to wipe a hard drive before restoring an image to it?

I. Logical copying
1. When is logical copying an option?
2. Can you verify logical copies of files?
3. What is not transferred with logical copies?

III. Practical Exercises
A. Image several different types of media on a computer with a hardware write-blocker. Verify the image and compare the hash values of the original media to the image.
B. Image several different types of media with a stand-alone imaging device.
C. Create a mirror copy.
D. Wipe several different types of media.
E. Restore an .E01 image.

IV. Court and Legal Procedures
A. The trainee shall receive instruction and training on courtroom procedures, presentation of evidence, and legal procedures. Topics may include: penal codes, statute of limitations, search warrants, subpoenas, discovery, court structure, rules of evidence, voir dire, (expert) witness demeanor and ethics, and observation of testimony.
B. Moot court: The trainee will participate in oral mock testimony that includes direct and cross examination as well as the introduction of evidence/exhibits.
C. Court and Legal Procedures training may be combined for several training modules and will be noted as such in the Digital Evidence Training Record.

V. Suggested Reading and References
D. Wikipedia MD5

END OF DOCUMENT
The Image Enhancement Module is designed to teach the trainee how to enhance image files. Many topics covered in Image Enhancement overlap with Video Enhancement as the filters applied to images may also be applied to video. The Image Enhancement and Video Enhancement training modules should be completed concurrently. This training module will also qualify the examiner for Image Production such as converting, annotating, fixing compatibility, and other functions with image files.

I. Objectives: Research and become familiar with the topics below.

A. Evidence Handling and Case Records
   1. Archives
   2. Working copies
   3. Approved Tools
   4. History log
   5. Case Records (notes)

B. File Formats
   1. Uncompressed (TIFF, BMP, etc.)
   2. Compressed (JPEG, GIF, etc.)
   3. RAW
   4. PSD, TIFF with layers

C. Metadata
   1. EXIF, IPTC
   2. Adobe Bridge, EXIFTool, MediaInfo, GSpot

D. Photoshop
   1. Saving, exporting
   2. Histogram
   3. Layers, Smart Layers, Smart Objects
   4. Camera RAW
   5. Brightness and Contrast Adjustments
      a. Curves
      b. Levels
      c. Exposure
      d. Contrast
      e. Whites and Blacks
      f. Shadows and Highlights
   6. Smart Sharpen, Unsharp Mask
   7. Shake Reduction
   8. Frame averaging
   9. Deinterlacing

II. Study Questions
A. Evidence Handling
   1. Archives
      a. Why do we create archives?
   2. Working copies
      a. Define a working copy.
      b. Why do we use working copies?
3. **Approved Tools**
   a. Why do we limit tools to the approved list?

4. **History log**
   a. What does the history log function in Photoshop do?

5. **Notes**
   a. What are the differences between the Photoshop history log and case notes?

**B. File Formats**

1. **Uncompressed (TIFF, BMP)**
   a. What is the definition of an uncompressed image file?

2. **Compressed (JPEG, GIF)**
   a. Describe image compression

3. **RAW**
   a. What is a RAW file?
   b. How is a RAW file different than a JPEG of TIFF created on a camera?
   c. Why does a RAW file have more data than a JPEG or TIFF?

4. **PSD**
   a. What is a PSD file?
   b. Why is it important to save layer settings in case files?

**C. Metadata**

1. **EXIF, IPTC**
   a. Cell phones (and some cameras) add what metadata that is extremely useful for investigations?

2. **Adobe Bridge**
   a. Bridge can be used to quickly access metadata, but what can Bridge do with Photoshop?

**D. Histogram**

1. Explain what a histogram is and how to read it.
2. How does a histogram work in a curves adjustment?
3. How does a histogram work in a levels adjustment?

**E. Layers, Smart Layers, Smart Objects**

1. Why is a smart adjustment layer most flexible than a filter?
2. What are the advantages of converting a raster layer to a Smart Object?
3. Why is it important to convert to Smart Object prior to Transforming a layer?

**F. Camera RAW**

1. Prior to using the Camera RAW filter, what should you do to the editing layer?
2. Can you use the Camera RAW filter on any image file type?
3. Explain the difference between using Camera RAW and each of the individual filters.

**G. Brightness and Contrast Adjustments**

1. Curves, Levels, Exposure, Contrast, Whites and Blacks, Shadows and Highlights - Describe each of these adjustments, what each adjustment tries to

**H. Smart Sharpen, Unsharp Mask**

1. Smart Sharpen vs. Camera RAW sharpen – What is the primary difference?

**I. Shake Reduction**

1. What is camera shake?
2. What artifacts are used to identify camera shake?

**J. Frame averaging**

1. Describe the theory behind frame averaging.
2. How does frame averaging remove noise?
3. Describe some situations where frame averaging may be used.

**K. Deinterlacing**

1. What is deinterlacing?
2. Where do interlaced images come from?
III. Practical Exercises
   A. For the following exercises, create a working copy, take case notes (include metadata), and save an uncompressed output file. Show the working copy, notes, and output file to your coach.
      1. Use a histogram to show that an area of an image is over or underexposed and no data is available in that area to enhance.
      2. Use several types of brightness and contrast adjustments on the same file and note the differences in the result. Minimally include Camera RAW filter, curves, and levels. Use smart objects and smart filters for each.
      3. Sharpening and blur reduction exercises
      4. Frame averaging exercise
      5. Deinterlacing exercise

IV. Court and Legal Procedures
   A. The trainee shall receive instruction and training on courtroom procedures, presentation of evidence, and legal procedures. Topics may include: penal codes
   B. Moot court: The trainee will participate in oral mock testimony that includes direct and cross examination as well as the introduction of evidence/exhibits.
   C. Court and Legal Procedures training may be combined for several training modules and will be noted as such in the Digital Evidence Training Rec

The Image Enhancement and Video Enhancement training modules should be completed concurrently. This training module will also qualify the examiner for Video Production such as converting, annotating, fixing compatibility, and other functions with video files.

I. Objectives: Research and become familiar with the topics below.

A. Evidence Handling and Case Records
   1. Archives
   2. Working copies
   3. Tools
   4. Notes

B. File Formats

C. Metadata
   1. GSpot, MediaInfo

D. Video File Structure
   1. Wrapper
   2. Video Codecs
   3. Audio Codecs
   4. Frame Size
   5. Frame Rate
   6. Aspect Ratio
   7. Pixel Aspect Ratio

E. Compression
   1. MJPEG
   2. MPEG-1, 2, 4
3. H.264
4. Interframe compression
5. i, p, and b frames
6. Group of Pictures (GOP)

F. Format Conversion and Source Extraction
   1. FFMPEG and FFPLAY
      a. Commands and batch files
      b. Playback, forcing codecs,
      c. Changing wrappers without affecting the codec
      d. Extracting i-frames
   2. VirtualDub
      a. Plug-ins and opening files
      b. Extracting frames and video segments
      c. Saving files and uncompressed AVIs

G. Video Cleaner
   1. Applying enhancements

H. Premier Pro
   1. Converting videos to play in Premier Pro
   2. Screen Capture
   3. Basic Editing
   4. Adding text and highlights
   5. Enhancements
   6. Stabilization

I. After Effects
   1. Adding text
   2. Stabilization

II. Study Questions
    A. What is the proper method for identifying metadata in a video file?
    B. Explain the structure of a video file, including wrappers and codecs.
    C. What is the difference between a wrapper and a codec?
    D. What is a common type of video where we encounter pixel aspect ratios?
    E. Explain interframe compression, and how i, p, and b-frames are used in it.
F. Why are i-frames preferred for enhancement?
G. What is FFMPEG?
H. What is the purpose of using different wrappers?
I. What is a potential problem when changing codecs?
J. What does stabilization do, and when can it be useful?

III. Practical Exercises

A. Enhance the practice files. Describe the issues in each file, then attempt to enhance them. Explain the purpose behind each filter you use.

B. Edit and convert the practice files. Document the process for each.

IV. Court and Legal Procedures

A. The trainee shall receive instruction and training on courtroom procedures, presentation of evidence, and legal procedures. Topics may include: penal codes, statute of limitations, search warrants, subpoenas, discovery, court structure, rules of evidence, voir dire, (expert) witness demeanor and ethics, and observation of testimony.

B. Moot court: The trainee will participate in oral mock testimony that includes direct and cross examination as well as the introduction of evidence/exhibits.

C. Court and Legal Procedures training may be combined for several training modules and will be noted as such in the Digital Evidence Training Record.

V. Suggested Reading and References

END OF DOCUMENT
The Audio Enhancement module is designed to teach the trainee how to enhance audio files. This training module will also qualify the examiner for Audio Production such as converting, fixing compatibility, and other functions with audio files.

I. **Objectives:** Research and become familiar with the topics below.

A. **Evidence Handling**
   1. Archives
   2. Working copies
   3. Tools
   4. History log
   5. Notes

B. **File Formats**

C. **Metadata**

D. **Sound**

E. **Frequency range of the human ear**

F. **Waveform display, spectral frequency display**

G. **Noise, masking, common problems with recordings**

H. **Distortion/clipping**

I. **Impulse**

J. **Signal to noise ratio (speech to noise)**

K. **Audio filters**
   1. Pass Filters
   2. Notch/Comb
   3. Graphic Equalizer
   4. Spectral Subtraction
   5. Reference Canceller
II. Study Questions

A. What is sound? How is sound created? How is sound transmitted?
B. What is the general difference between cheap and quality speakers (headphones)?
C. What is noise?
D. What is the frequency range of the human ear?
E. What is the frequency range of the human voice?
F. What does the Nyquist Theorem explain?
G. What is “masking”?
H. How can you identify distortion in a recording? What causes distortion during recording? Why is this a problem for audio enhancement?
I. Explain why repeated sounds (motors, fans) are easier to remove than random noise.
J. Describe the following audio filters:
   1. Pass Filters
   2. Notch/Comb
   3. Graphic Equalizer
   4. Spectral Subtraction
   5. Reference Canceller

III. Practical Exercises

A. Enhance the practice files. Describe the issues in each file, then attempt to enhance them. Explain the purpose behind each filter you use.

IV. Court and Legal Procedures

A. The trainee shall receive instruction and training on courtroom procedures, presentation of evidence, and legal procedures. Topics may include: penal codes, statute of limitations, search warrants, subpoenas, discovery, court structure, rules of evidence, voir dire, (expert) witness demeanor and ethics, and observation of testimony.

B. Moot court: The trainee will participate in oral mock testimony that includes direct and cross examination as well as the introduction of evidence/exhibits.

C. Court and Legal Procedures training may be combined for several training modules and will be noted as such in the Digital Evidence Training Record.

V. Suggested Reading and References

END OF DOCUMENT
The Field Services module is designed to teach the trainee how to recover audio, video, and image files from digital video recorders (DVR). Due to the numerous hardware, software, and operating systems in DVRs this training module is not designed to teach a step-by-step method for each DVR system. Instead, this training module is intended to introduce the trainee to different methods of recovery and to expose the trainee to different hardware, software, and operating system configurations.

I. Objectives: Research and become familiar with the topics below.
   A. Review the following Crime Scene policies: CS.01 CS.02, and CS.03
   B. Evidence Handling and Case Records
      1. Legal Authority
      2. Case Records (notes)
      3. Photographs
      4. Sketches with camera placement
      5. Evidence collection
      6. Technical assist
   C. Evidence photography
   D. DVR Hardware
      1. Stand-alone systems
      2. PC-based systems
      3. Cameras
      4. Cables
   E. Manuals
      1. Default passwords
   F. Recording DVR settings
      1. Hardware information
      2. Time and date
      3. Calculating time and date offset
      4. Video recording settings
   G. Exporting data
      1. Choose appropriate media
      2. Native file format
      3. Network export
      4. Video signal capture
5. Screen recording
6. Hard drive imaging
   a. Problems with HDD imaging

H. Scene considerations

II. Study Questions
A. Is DVR recovery a full crime scene or a technical assist?
B. List some of the required items in a search warrant related to DVR recovery.
C. Describe the photographs you should take when recovering video from a DVR.
D. PC-based DVR systems may also run other software for a business. What issues does this introduce?
E. Is it possible to have two identical DVRs with different operating systems?
F. Describe some useful information found in DVR manuals.
G. Why is it important to record a DVR’s time and date setting?
H. What are some words DVRs use to describe saving data to external media?
I. What is a native file format and what are some positive and negative consequences of it?
J. List some limitations of video signal capture.
K. List some complications with recovering videos from an imaged hard drive.

III. Practical Exercises
A. Recover videos from several DVR systems using different methods (native, video signal capture, network export, etc.) Document the systems with photographs and notes.

IV. Court and Legal Procedures
A. The trainee shall receive instruction and training on courtroom procedures, presentation of evidence, and legal procedures. Topics may include: penal codes, statute of limitations, search warrants, subpoenas, discovery, court structure, rules of evidence, voir dire, (expert) witness demeanor and ethics, and observation of testimony.
B. Moot court: The trainee will participate in oral mock testimony that includes direct and cross examination as well as the introduction of evidence/exhibits.
C. Court and Legal Procedures training may be combined for several training modules and will be noted as such in the Digital Evidence Training Record.

V. Suggested Reading and References

B. SWGIT Best Practices for Retrieval of Digital Video

VI. Digital Evidence Field Services Training and Competency
1. The recommended (but not required) training for Field Services training is the Federal Bureau of Investigation's DIVRT (Digital Imaging Video Response Team) class.
2. The Field Services competency test is contained within the Forensic Imaging competency test.

END OF DOCUMENT
I. General Information: The Latent Print Unit analyzes friction ridge detail from the palmar sides of the hands and the soles of the feet. The friction ridge detail may come in the form of latent prints, inked prints, livescan prints, major case exemplars, patent prints, plastic prints, body parts, or digital images.

A. The unit manual policies and procedures apply to all forms of friction ridge detail testing.

B. The term latent print is used most commonly throughout the manual, but the same methodology applies to all forms of friction ridge detail examinations.

II. Services Provided:

A. Comparisons

1. The latent unit tests friction ridge detail, developed on items processed in the laboratory or collected out in the field. Usable prints are compared to persons submitted as suspect or elimination.

2. Refer to LP.19 for further information on the use of the ACE-V method for friction ridge testing.

B. Automated Biometric Database Searches (ABIS)

1. Friction ridge impressions that qualify, may be routinely searched through the following databases:

   a. Local Database: Contra Costa County and Alameda County fingerprint and palm print records.

   b. California Department of Justice (DOJ) Database: fingerprint and palm print records.

2. Refer to LP.28 for further information on the use of an ABIS database for friction ridge testing.

C. ABIS Notifications

1. Agencies will receive an ABIS notification when an enrolled latent print has a potential match in the Unsolved Latent Database.
2. Once notified, agencies are responsible for following through on the ABIS notification, by re-submitting the evidence with a comparison request to the laboratory for further testing.

3. Refer to LP.14 for further information on ABIS notifications.

D. **Latent Print Development**

1. The latent unit uses a wide variety of chemical, lighting, photography, and physical techniques to process and collect friction ridge detail for further testing.

2. Refer to LP.31 for a complete list of approved processing techniques, policies, and procedures.

E. **Consultation**

1. The latent unit may provide consultation or assistance with the collection of known prints. For example, collection of exemplars from deceased or incarcerated individuals.

2. Qualifying analysts may provide consultation to other FSD staff during examination in other disciplines.
   
   a. Note: Quality interpretation for ridge detail present on items tested in another unit must be reported.

F. All testing will have a written report; communicated in a clear, accurate, and unambiguous manner.

G. Analysts may be called to provide expert testimony.

END OF DOCUMENT
I. The following are standard terminology used in Friction Ridge Examination:

A. Glossary:

2. Anchor Point: Any feature that gives discernible anatomical orientation and location (e.g., core, delta, distinct minutiae grouping, crease).

3. Arch:
   1. Plain Arch: A pattern type in which the friction ridges enter on one side of the impression and flow, or tend to flow, out the other side with a rise or wave in the center.
   2. Tented Arch: A pattern type that possesses either an angle, an upthrust, or two of the three basic characteristics of a loop.

4. Artifact: Any distortion or alteration not in the original friction ridge impression, produced by an external agent or action.

6. Bifurcation: The point at which one friction ridge divides into two friction ridges.

7. Blind Verification: The independent examination of one or more friction ridge impressions at any stage of the ACE process by another competent examiner who is provided with no, or limited, contextual information, and has no expectation or knowledge of the determinations or conclusions of the original examiner.

8. Bridge: A connecting friction ridge between, and generally at right angles to, parallel running friction ridges.

9. Carpal Delta: Area of the palm containing a delta formation nearest the wrist.

10. Characteristics (Features): Distinctive details of the friction ridges, including Level 1, 2, and 3 details.

11. Cognitive Bias: The effect of perceptual or mental processes on the reliability and validity of one's observations and conclusions.

12. Comparison: The second step of the ACE-V method. The observation of two or more impressions to determine the existence of discrepancies, dissimilarities, or similarities.

13. Competency: Possessing and demonstrating the requisite knowledge, skills, and abilities to successfully perform a specific task.
14. **Complex Examination**: The encountering of uncommon circumstances during an examination (e.g., the existence of high distortion, low quality or quantity, the possibility of simultaneity, or conflicts among examiners).

15. **Conclusion**: Determination made during the evaluation stage of ACE-V, including individualization, inconclusive, and exclusion.

16. **Confirmation Bias**: The tendency to search for data or interpret information in a manner that supports one's preconceptions.

17. **Conflict**: A difference of determinations or conclusions that becomes apparent during, or at the end of, an examination.

18. **Consultation**: A significant interaction between examiners regarding one or more impressions in question.

19. **Contextual Bias**: The effect of information or outside influences on the evaluation and interpretation of data.

20. **Core**:
   1. The approximate center of a fingerprint pattern.
   2. A specific formation within a fingerprint pattern, defined by classification systems such as Henry.

21. **Crease**: A line or linear depression; grooves at the joints of the phalanges, at the junction of the digits and across the palmar and plantar surfaces that accommodate flexion.

22. **Cross-Hatching**: Multiple interwoven creases, very commonly found in the Thenar area of the palm.

23. **Crows Feet**: Bifurcating creases which are part of the top crease, or at the base of the outside fingers, that tend to open toward the outside of the hand.

24. **Delta**: The point on a friction ridge at or nearest to the point of divergence of two type lines, and located at or directly in front of the point of divergence.

25. **Deposition Pressure**: The amount of downward pressure during the deposition of a print.

26. **Development Medium**: The substance used to develop friction ridge prints.

27. **Deviation**:
   1. A change in friction ridge path.
   2. An alteration or departure from a documented policy or standard procedure.

28. **Discrepancy**: The presence of friction ridge detail in one impression that does not exist in the corresponding area of another impression.

29. **Dissimilarity**: A difference in appearance between two friction ridge impressions.

30. **Dissociated Ridges**:
   1. Disrupted, rather than continuous, friction ridges.
   2. An area of friction ridge units that did not form into friction ridges, generally due to a genetic abnormality.
31. **Distal Transverse Crease**: The crease which separates the Interdigital and Hypothenar areas of the palm and is also known as the "Top Crease".

32. **Distortion**: Variances in the reproduction of friction skin caused by factors such as pressure, movement, force, and contact surface.

   1. Terms used to describe these variances may include, but are not limited to drag marks, compression, shifting, smudging, smearing, contrast issues, displacement, pressure, voids, misaligned ridges, and reversal.

33. **Dot**: An isolated friction ridge unit whose length approximates its width in size.

34. **Double Tap**: A subtle double impression where additional friction ridges will coincide or be close to running in the same direction, and in close proximity, as the existing ridge flow.

35. **Edgeoscopy**: Contour or shape of the edges of friction ridges.

36. **Elimination Prints**: Exemplars of friction ridge skin detail of persons known to have had legitimate access to an object or location.

37. **Enclosure**: A single friction ridge that bifurcates and rejoins after a short course and continues as a single friction ridge.

38. **Ending Ridge**: A single friction ridge that terminates within the friction ridge structure.

39. **Erroneous Exclusion**: The incorrect determination that two areas of friction ridge impressions did not originate from the same source.

40. **Erroneous Individualization**: The incorrect determination that two areas of friction ridge impressions originated from the same source.

41. **Evaluation**: The third step of the ACE-V method wherein an examiner assesses the value of the details observed during the analysis and the comparison steps and reaches a conclusion.

42. **Exclusion**: The determination by an examiner that there is sufficient quality and quantity of detail in disagreement to conclude that two areas of friction ridge impressions did not originate from the same source.

43. **Exemplar/Known Prints**: The prints of an individual, associated with a known or claimed identity, and deliberately recorded electronically, by ink, or by another medium.

44. **False-Negative Rate**: The proportion of the comparisons between mated prints that result in an erroneous exclusion conclusion.

45. **False-Positive Rate**: The proportion of the comparisons between non-mated prints that result in an erroneous individualization conclusion.

46. **Fault Line**: Shadowing in an impression in the form of a curved line. A visual clue that distortion may exist.

47. **Fingerprint**: An impression of the friction ridges of all or any part of the finger.

48. **Fish-Eye Void**: This is created by a small ball of fingerprint powder being left behind during the latent development phase which prevents the latent lift tape from sticking completely to the surface of the item, leaving behind an empty space with a small powder dot in the center, resembling an eye.

49. **Friction Ridge**: A raised portion of the epidermis on the palmar or plantar skin, consisting of one or more connected ridge units.
50. **Funnel Area**: Convergence of ridge flow near the top of the Hypothenar toward the center of the palm.

51. **Furrows**: Valleys or depressions between friction ridges.

52. **Ground Truth**: Definitive knowledge of the actual source of an impression.

53. **Half-Moon**: Typical ridge flow of the Thenar area.

54. **Henry Classification**: An alpha-numeric system of fingerprint classification named after Sir Edward Richard Henry used for filing, searching, and retrieving tenprint records.

55. **Hypothenar**: Area of palm below the Interdigital region on the ulnar or little finger side.

56. **Identification/Individualization**: The determination by an examiner that there is sufficient quality and quantity of detail in agreement to conclude that two friction ridge impressions originated from the same source.

57. **Impression**: Friction ridge detail deposited on a surface.

58. **Incipient Ridge**: A friction ridge not fully developed that may appear shorter and thinner than fully developed friction ridges.

59. **Inconclusive**: The determination by an examiner that there is neither sufficient agreement to identify, nor sufficient disagreement to exclude.

60. **Interdigital**: Area of the palm below fingers and above the Thenar and Hypothenar.

61. **Joint** (of the finger): The hinged area that separates segments of the finger.

62. **Latent Print**:
   1. Transferred impression of friction ridge detail not readily visible.
   2. A generic term used for unintentionally deposited friction ridge detail.

63. **Lateral Pressure**: Force applied parallel to the surface that the skin is touching (resulting in drag).

64. **Level 1 Detail**: Friction ridge flow, pattern type, and general morphological information.

65. **Level 2 Detail**: Individual friction ridge paths and associated events, including minutiae.

66. **Level 3 Detail**: Friction ridge dimensional attributes, such as width, edge shapes, and pores.

67. **Lift**: An adhesive or other medium used to transfer a friction ridge impression from a substrate.

68. **Loop**: A pattern type in which one or more friction ridges enter upon one side, recurve, touch or pass an imaginary line between delta and core and flow out, or tend to flow out, on the same side from which the friction ridges entered.
   1. Left slant loop: Pattern flows to the left of the impression
   2. Right slant loop: Pattern flows to the right of the impression
   3. Radial loop: Pattern flows in the direction of the radius bone of the forearm (toward the thumb)
   4. Ulnar loop: Pattern flows in the direction of the ulna bone of the forearm (toward the little finger).
69. **Major Case Prints**: A systematic and complete recording of all friction ridge detail appearing on the palmar side of the hands but may also include the plantar side of the feet. This includes the extreme sides of the palms, joints, tips, and sides of the fingers.

70. **Matrix**: The substance that is deposited or removed by the friction ridge skin when making an impression.

71. **Minutiae** (Galton Detail): Term referring to friction ridge characteristics attributed to the research of English fingerprint pioneer, Sir Francis Galton. Event along a ridge path, including bifurcations, ending ridges and dots.

72. **Morphology** (Friction ridge detail): An area comprised of the combination of ridge flow, ridge characteristics, and ridge structure.

73. **Open Field**: An area of uninterrupted ridges.

74. **Overlay**: A double impression where additional friction ridges overlap an existing friction ridge image. Overlays will not coincide with ridge flow and may exhibit some type of checkering. Overlays are not immediate double impressions of ridge detail, and may or may not be the same finger impression or be made by the same individual.

75. **Palm print**: An impression of the friction ridges of all or any part of the palmar surface of the hand.

76. **Patent Print**: Friction ridge impressions which are visible and have been caused by the transfer of foreign material from a finger onto a surface (e.g. impressions in blood or paint).

77. **Plastic Print**: Friction ridge impression left in a material that retains the shape of the ridge detail (e.g., prints left in clay, candle wax, putty, or thick grease deposits).

78. **Pattern Area**: The part of a fingerprint that contains the cores, deltas, and ridges that are used for classification.

79. **Pattern Force (Area)**: A region of friction ridge skin in which minutiae of a particular type are forced to form due to the flow of the ridges. For example, in the outflow of a loop where ridges are converging, forcing many ridge endings as space runs out; or in the delta area of a loop or whorl. Because the pattern forces these minutiae to form predictably and their configurations are more common and less random, they are properly assigned less weight towards an association between two impressions than other areas of friction ridge skin.

80. **Pattern Type**: Fundamental pattern of the ridge flow: arch, loop, whorl.
   1. Arches are subdivided into plain and tented arches.
   2. Loops are subdivided into radial and ulnar loops; or right slant and left slant loops.
   3. Whorls are subdivided into plain, double loop, central pocket loop, and accidental whorls.

81. **Poroscopy**: A study of the size, shape, and arrangement of pores.

82. **Proficiency**: The ongoing demonstration of competency.

83. **Proximal Transverse Crease**: The crease that runs across the middle palm and usually ends in the funnel region of the Hypothenar and is also known as the "Middle Crease".

84. **Quality**: The clarity of information contained within a friction ridge impression.

85. **Quantity**: The amount of information contained within a friction ridge impression.
86. **Radial Longitudinal Crease**: The crease that enters with or directly below the middle crease and exits the palm on the thumb side of the carpal delta. It is also known as the "Bottom Crease".

87. **Ridge Flow**: The direction of one or more friction ridges; a component of Level 1 detail.

88. **Ridge Path**: The course of a single friction ridge; a component of Level 2 detail.

89. **Scar**: A mark remaining after the healing of a wound.

90. **Short Ridge**: A single friction ridge beginning, traveling a short distance, and then ending.

91. **Simultaneous Impression**: Two or more friction ridge impressions from the same hand or foot deposited concurrently.

92. **Source**: An area of friction ridge skin from an individual from which an impression originated.

93. **Specificity**: The subjective weight of a feature depending on its rarity in a given location (how specific the feature is).

94. **Spur**: A bifurcation with one short friction ridge branching off a longer friction ridge.

95. **Streaking Ridges**: When the ridges touch down on a surface and move, they can leave streaks in the furrows.

96. **Substrate**: The surface upon which a friction ridge impression deposited.

97. ** Sufficiency**: The product of the quality and quantity of the objective data under observation (e.g., friction ridge, crease, and scar features).

98. **Sufficient**: The determination that there is sufficiency in a comparison to reach a conclusion at the evaluation stage.

99. **Suitable**: The determination that there is a sufficiency in an impression to be of value for further analysis or comparison.

100. **Target Group**: A distinctive group of ridge features (and their relationships) that can be easily recognized.

101. **Thenar**: Area of the palm below the Interdigital region associated with the radial or thumb side.

102. **Tolerance**: The amount of variation in appearance of friction ridge features to be allowed during a comparison, should a corresponding print be made available.

103. **Tonal Reversal**: A transferred impression representing the furrows of a friction ridge impression rather than the ridges creating the reverse effect than expected. Occurrence can be attributed to excess moisture present on the substrate or skin, as well as heavy deposition pressure.

104. **Transient Crease**: Creases which are not permanent.

105. **Type Lines**: The two innermost friction ridges associated with a delta that parallel, diverge, and surround or tend to surround the pattern area.

106. **Verification**: The independent application of the ACE process as utilized by a subsequent examiner to either support or refute the conclusions of the original examiner, and the final step of the ACE-V method.
107. **Vestige**: A group of ridges that flow perpendicular, or near perpendicular, to the ridges around them, normally found in the Thenar region.

108. **Waterfall**: Ridges that begin between the index and middle fingers, that flow outward towards the ulnar or little finger side of the palm.

109. **Whorl - Accidental**:
   1. A pattern type consisting of the combination of two different types of patterns (excluding the plain arch) with two or more deltas.
   2. A pattern type that possesses some of the requirements of two or more different types of patterns.
   3. A pattern type that conforms to none of the definitions of a pattern.

110. **Whorl - Central Pocket Loop**: A pattern type that has two deltas and at least one friction ridge that makes, or tends to make, one complete circuit, which may be spiral, oval, circular, or any variant of a circle. An imaginary line drawn between the two deltas must not touch or cross any recurving friction ridges within the inner pattern area.

111. **Whorl - Double Loop**: A pattern type that consists of two separate loop formations with two separate and distinct sets of shoulders and two deltas.

112. **Whorl - Plain**: A pattern type that consists of one or more friction ridges that make, or tend to make, a complete circuit, with two deltas, between which, when an imaginary line is drawn, at least one recurving friction ridge within the inner pattern area is cut or touched.

113. **Wobble**: Small movements during the touch on a surface resulting in the impression having an odd shape without indication of heavy shifting in any particular direction.

114. **Writer's Palm**: The outer edge of a palm print typically left on a document when people write. This impression includes the outer portion of the Hypothenar and may include the outer edge of the Interdigital region and little finger.

II. The following are common abbreviations/acronyms used in the Latent Print Unit. Additional abbreviations commonly used in society or Law Enforcement may not be contained in this list.

A. **Fingers/Fingerprint Classification**
   1. Accidental whorl: X
   2. Arch: A
   3. Central pocket loop whorl: C
   4. Double loop whorl: D
   5. Extreme fingertip: TIP
   6. Fingerprint: FP
   7. Joint: JT
   8. Left index: #7 / LI
   9. Left little: #10 / LL
   10. Left middle: #8 / LM
   11. Left ring: #9 / LR
12. Left slant loop: L
13. Left thumb: #6 / LT
14. Lower joint: LJ
15. Plain whorl: PW
16. Right index: #2 / RI
17. Right little: #5 / RL
18. Right middle: #3 / RM
19. Right ring: #4 / RR
20. Right slant loop: R
21. Right thumb: #1 / RT
22. Second joint: 2J / 2nd J
23. Tented arch: T
24. Third joint: 3J / 3rd J
25. Whorl: W

B. Palm Prints
   1. Carpal delta: CARP
   2. Hypothenar: HYPO / HYPOTHEN
   3. Interdigital: I / INT / INTER
   4. Left palm: LP
   5. Palm Print: PP
   6. Right palm: RP
   7. Thenar: T / THEN

C. Analysis/Comparison/Evaluation
   1. Alphabetical: ALPHA
   2. Alternate: ALT
   3. Applicant: APP
   4. Available: AVAIL
   5. Background: BKGRND
   6. Between: BTW
   7. Black and White: B&W
   8. Compression: COMP
   9. Contain or Containing: C: / C (with a line above)
10. Deposition: DEP
11. Detail: DET
12. Distortion: DIST / DISTORT
13. Double: DBL
14. Double Tap: DBLTAP
15. Duplicate(s): DUP / DUPS
16. Elimination: ELIM
17. Evaluation: EVAL
18. Exclusion Value: EV
19. Exemplars: EXEMPS
20. Exterior: EXT
21. Fingerprint Exemplar: 10-print
22. Friction Ridge Skin: FRS
23. From: FM
24. Identification: ID / IDENT
25. Identified: ID'd
26. Incipient ridges: INCIP
27. Inconclusive: INC
28. Insufficient- (applies to the exemplar): INS
29. Interior: INT
30. Latent(s): LAT / LATS
31. Latent Print: lp
32. Lateral Displacement: LATDIS
33. Left: LT
34. LiveScan: LS
35. Located: LOC
36. Medium: MED
37. Manual Identification: MID
38. Minutia difference: M
39. Movement: MOVMT
40. Multiple impressions of the same finger: 2X (twice), 3X (three times), etc.
41. Need Exemplar(s): NE
42. No Dissimilarities: ND / NO DIS
43. No Prints Visible: NPV
44. No Record Located: NRL
45. No Record: N/R
46. No usable print(s): NV
47. Not compared: N/C
48. Not Compared Same Surface: NCSS
49. Obscured Region: OR
50. Observation: OBS
51. Obvious: OBV
52. Palm print exemplar: PPE
53. Palm print to Latent Inquiry: P/LI
54. Pattern: PATT
55. Pattern & Minutia difference: PM
56. Pattern difference: P
57. Peer Review: PRV
58. Possible: POSS
59. Post Mortem: POST MORT
60. Pressure: PRESS
61. Pressure Distortion: PRESS DISTORT
62. Pressure Reversal: PRES REV / PR
63. Present: PRES
64. Previously Identified: PREV IDENT / PI
65. Record: REC
66. Registered: REG
67. Returned: RET
68. Ridge Flow: RF
69. Right: RT
70. Rotational: ROT
71. Ten print to Latent Inquiry: T/LI
72. Through: THRU
73. Undisclosed Location: UNDIS LOC
74. Unidentified: UNIDENT
75. Unknown: UNK
76. Victim: VIC / V
77. Visible: VIS
78. With: W/

D. Processing
1. Alternate Light Source: ALS
2. Amido Black: AM BLK / AB
3. Apparent: APP
4. Approximate(ly): APPROX
5. Atmospheric Chamber: ATMO / ATMOS
6. Bi-chromatic: BI-CHRO
7. Black: BLK
8. Black Powder: BP / BLK PDR / BLK PWDR
9. Blank Reaction Negative: BLANK- / B-
10. Cardboard Box: CB
11. Cartridge(s): CART / CARTS
12. Control Reaction Positive: CONT + / C+
13. Cyanoacrylate Ester: CA / CAE
14. Developed: DEV / DEVEL
15. De-Ionized water: DI
16. Electrical: ELEC
17. Envelope: ENV
18. Evidence: EVID
19. Expiration: EXP
20. Fingerprint Envelope: FPE
21. Headstamp(ed): H/S
22. Hungarian Red: HR / HUN
23. 1,2-Indanedione: IND
24. Laboratory Evidence and Latent Envelope: LE
25. Latent Print Envelope: LPE
26. Magazine/Pistol Magazine: MAG
27. Magnetic Powder: MAG PWDR
28. Manila Envelope: ME
29. 7-(p-methoxybenzylamino) 4-nitrobenz-2oxa-1,3-diazole: MBD
30. Model #: MOD #
31. Ninhydrin: N / NIN
32. Page: PG / P.
33. Paper bag: PB
34. Physical Developer: PD
35. Plastic Bag: PLSB / PLB
36. Powder: PWDR
37. Processed: PROC'D
38. Quality Check: QC
39. Relative Humidity: RH
41. Rhodamine 6G, Ardrox, 7-(p-methoxybenzylamino) 4-nitrobenz-2oxa-1,3-diazole: RAM
42. Ruthenium Tetroxide: RTX
43. Serial #: SER # / S# / SN
44. Small: SM
45. Submission: SUB
46. Substance: SUBST
47. Tape Sealed: TS
48. Tape Sealed Controlled Substance Envelope: TSCSE
49. Tape Sealed Envelope: TSE
50. Tape Sealed Fingerprint Envelope: TSFPE
51. Tape Sealed Manila Envelope: TSME
52. Tape Sealed Cardboard Box: TSCB
53. Tape Sealed Paper Bag: TSPB
54. Tape Sealed Plastic Bag: TSPLB
55. Ultraviolet Light: UV
56. Vacuum Chamber: V / VAC
57. Visible: VIS
58. White: WHT
59. Ziploc plastic bag: ZLPB

E. **Acronyms/Symbols**

1. A latent print that is qualified to search a database: *
2. Alameda County Sheriff’s Department: ACSD
3. Also Known As: AKA
4. Analysis, Comparison, Evaluation, and Verification: ACE-V
5. Automated Biometric Identification System: ABIS
6. Automated Fingerprint Identification System: AFIS
7. Automated Latent Print Search: ALPS
8. California: CA
9. California Drivers License: CDL
10. California Law Enforcement Telecommunication System: CLETS
11. Captain: CAPT
12. Contra Costa County Sheriff’s Office: CCCSO
13. Contra Costa Identification Number: CCIN
14. Corporal: CPL
15. Criminal Identification and Information: CII
16. Date of Arrest: DOA
17. Date of Birth: DOB
18. Department of Justice: DOJ
19. Deputy and Department: DEP
20. Detective: DET
21. Drivers License: DL
22. Federal Bureau of Investigation: FBI
23. Integrated Automated Fingerprint Identification System: IAFIS
24. Jail Management System: JMS
25. Lieutenant: LT
26. Next Generation Identification: NGI
27. Organization of Scientific Area Committees: OSAC
28. Person File Number: PFN
29. Record Management System: RMS
30. Scientific Working Group on Friction Ridge Analysis, Study and Technology: SWGFAST
31. Sergeant: SGT
32. State Identification Number: SID
33. Technical Lead: TL
34. Ten-Print to Latent Inquiry: T/LI
35. Training Coordinator: TC
36. Training Officer: TO
37. Unsolved Latent Database: ULDB

END OF DOCUMENT
I. Requests for Latent Unit services must be on the appropriate FSD Request Form (See FSDF.16) or Latent Lift Envelope Request Form. The request will be reviewed to determine if the laboratory has the capability to perform the work requested. See FSD.14 for more information.

A. Latent Request Information

1. A Criminalistics Request form or Latent Lift Envelope (also a request form) should be completed by the submitting agency.

2. The form should indicate the evidence being submitted (items for processing, latent lift cards, etc.) and what work is being requested. If the request form is submitted without evidence, the "Request only" box should be checked, or otherwise indicated.

3. Subjects to be compared (Suspect or Elimination) should be listed on the request form along with the individual's Date-Of-Birth.

4. If the request is a Rush, the appropriate area should be filled in on the request form, including the reason if known.

   a. Rush and Expedite/ASAP cases will be prioritized. Any case requiring unusually fast turn around time should be approved by a Supervisor, Manager, or designee. If the assigned analyst cannot meet the agreed upon completion date, the unit Supervisor, Manager, or designee must be notified.

5. The clerical staff should verify that the above criteria are met prior to logging the request into Laboratory Information System (LIMS).

6. Clerical staff must scan the request form and chain of custody information into LIMS. If either is not in LIMS, it is the responsibility of an analyst to complete this task prior to Admin Review.

7. Once logged in, clerical staff will typically transfer the evidence to the Evidence Storage Room and give the Request Form or Assignment Notification to the Latent Unit.

END OF DOCUMENT
I. Evidence Handling Policy: The latent print unit will maintain the integrity of evidence in the custody of the laboratory by handling and storing evidence in a way that will minimize loss, degradation, contamination and deleterious change. While in the custody of the latent unit, staff will maintain control and track evidence by recording secure evidence transfers using LIMS.

A. See LP.64 for information on contamination prevention while handling evidence.

B. Refer to FSD.35 and QA.09 for more information on evidence handling.

C. Accepting & Receiving Evidence

1. Evidence submitted for latent testing will be accompanied by a properly filled out request form. For information on requests for analysis, see FSD.14, and for the Criminalistics Request form, see FSDF.16.

2. Staff will determine if evidence received meets evidence acceptance requirements listed in FSD.35 and latent specific requirements below.

   a. The latent unit may choose not to process items under the following circumstances:

      i. evidence previously handled without gloves by the submitting agency.

      ii. items not conducive to latent residues, and are unlikely to yield favorable results.

      iii. evidence that pose a threat to the health and safety of staff.

   b. When staff choose not to process an item submitted for testing, the report will indicate the reason the item was not processed.

      i. The report will also indicate the disposition of the evidence, including evidence that is sent to another unit for testing.

   c. For information on halting In-Progress work, see LP.14.

3. Evidence is logged into the Laboratory Information Management System (LIMS) and is tracked through the electronic Chain of Custody. See CLER.CRIM.02 and FSD.35.

   a. Evidence returning to the laboratory for further testing after the original request is completed, will be given a subsequent request in LIMS.
i. Whenever possible, the analyst who completed the original request, will also be assigned to the subsequent request.

4. **Latent Print Cards**
   a. Should be submitted in a Latent Print Evidence Envelope (also serves as the request).
   b. For over-sized or numerous lifts, a larger Manila Envelope or Paper Bag may be used.
   c. Request information must be filled out and include the chain-of-custody.
   d. Packaging must be properly tape-sealed, including the initials of the person sealing the evidence.

5. **Items to Be Processed**
   a. Items requiring processing for latent prints are submitted in various types of packaging depending on the size and shape of the item. Packaging information must be filled out and include a chain of custody. Packaging must be properly tape sealed including the initials of the person sealing the evidence.
   b. Occasionally evidence can not be packaged and properly tape sealed due to the size and shape of the item. In this situation, all efforts to protect the surface areas of the evidence will be made.
      i. Gloves must be worn by any laboratory staff handling the evidence.
      ii. Once logged in, the item will be transferred in LIMS to an evidence storage location based on available space.
   c. Firearms **must** have an Unloaded label with date and initials indicating the firearm is unloaded. Upon verifying the presence of the sticker, mark the unloaded checkbox in LIMS, under the Additional Data Field.

6. **Exemplar Prints**
   a. Exemplar fingerprints and palm prints are not evidence and do not need to be in a sealed container, nor do they require a chain of custody.
   b. Exemplars potentially contaminated with body fluids should be sealed in a clear plastic container, allowing the contents to be examined through the plastic.

D. **Chain of Custody & Evidence Transfers**
   1. A chain of custody record provides a comprehensive and documented history of each case submission. All evidence will be securely transferred when the examiner obtains custody of the item or transfers the item to a person or designated location.
   2. Transfers of evidence are recorded in LIMS contemporaneously with the physical transfer of evidence to a location or person. The evidence transfer must be recorded in LIMS prior to breaking the seal on the evidence package.

E. **Inventory, Marking and Sealing of Evidence**
   1. When practicable, seals should not be disturbed to gain access to the evidence.
2. Care must be taken when more than one container is opened to prevent loss, cross transfer, contamination or deleterious change.

3. The contents of an evidence container will be inventoried as soon as it is opened and compared with the evidence description in LIMS, on the container, and the Request Form.
   a. If a discrepancy is found, the examiner must document the discrepancy in their case notes and correct the evidence description in LIMS accordingly. See FSD.42 for more information on discrepancy documentation requirements.
   ii. Depending on the situation and type of evidence discrepancy, analyst discretion will dictate whether or not clarification is needed from the requester or requesting agency. When necessary, the analyst may attempt to contact the agency for clarification and document the communication.

4. Each item of evidence will be marked with the examiner's initials, the laboratory number with request number, the item number, and the date.
   a. Under the following circumstances, the identifying information may be placed on the container as opposed to the evidence itself:
      i. The evidence is too small for the information.
      ii. Marking the evidence will damage the evidence or interfere with subsequent examinations.
      iii. The nature or texture of the item prevents it from being marked.
      iv. The number of items makes it impractical to mark each one.
      v. If evidence items are placed in secondary containers for convenience, the new container(s) must have the identifying markings as listed above.

5. Upon completion of the examination, evidence will be tape sealed; tape initialed and dated; and securely transferred to the appropriate location.

6. On Firearms evidence, ensure the firearms-processing checklist label is marked: check the latent box to indicate latent processing was completed, or "N/A" as appropriate.

F. Storage of Evidence
1. Prior to examination, evidence should be stored in the Evidence Room and its location recorded in LIMS.

2. In progress evidence will be stored in the examiner's personal workstation, holding-file, or processing room (indicated in LIMS as the analyst), and may be unsealed. Care must be taken to secure the evidence to prevent loss or deleterious change.

3. Evidence awaiting verification will be appropriately and securely clipped or closed, then transferred in LIMS to the appropriate Fingerprint Holding File, or directly to an examiner for review.

END OF DOCUMENT
I. Policy: All evidence submitted to the laboratory, or generated at the laboratory, will be itemized according to FSD.38.

A. It is the responsibility of the analyst to account for all evidence within a submission, itemizing at level 2 and below in LIMS, to capture evidence information concisely.

B. Packages containing a single digital image, or one latent lift card, will be itemized, as will single item evidence submitted for latent processing.
   1. If another unit in the laboratory does work on evidence prior to the latent unit, the item number reported for that evidence is maintained.

C. Lab-Generated Evidence is evidence that has been created from laboratory examination.
   1. CDs and DVDs created by the analyst, containing digital images of latent prints collected during laboratory processing, are considered lab-generated evidence.
   2. When beginning the electronic chain of custody in LIMS, analysts will use the agency representative Lab-Generated Evidence under the Forensic Services Division agency.
   3. See QA.09 (Lab-Generated Evidence) for more information and procedures.

D. Split Chain of Custody: the purpose of this process is to split the chain of custody of a child item from its parent in LIMS.
   1. An example of a time when split chain of custody would be used is when swabs are collected from an item.
   2. Ensure that the parent and child item are in the analyst's personal custody.
   3. See QA.09 (Split Chain of Custody) for more information and procedures for splitting the chain of custody.

E. Containerizing is grouping any split LIMS items into a new or different package.
   1. See QA.09 (Containerize Evidence) for more information and examples of containerizing.
   2. When beginning an electronic chain of custody in LIMS, analysts will use the agency representative Lab-Containerized under the Forensic Services Division.
I. POLICY: The test record includes all data, information, results and interpretations, and documentation from carrying out tests. The Latent Unit adheres to the requirements of the Division Manual in regards to Test Records (FSD.42) and Test Reports (FSD.43) with the following additions and clarifications.

A. Test Records: technical records and administrative records pertaining to testing performed. The following test record documentation is in LIMS or housed with the case file, and are included in the scope of the administrative and technical review process. For LIMS imaging procedures see QA.14.

1. Technical Records: data, documentation, and information from carrying out tests are included in the test record.
   a. Technical records to support a test report will contain sufficient information such that another reviewer possessing the relevant knowledge, skills, and abilities could evaluate what was done and interpret the data.
      i. Abbreviations used by the latent unit are specified in the Terminology and Abbreviations policy: LP.02
   b. LIMS will contain: original observations, tests conducted, reagents and equipment used, results, and analyst interpretations of all examinations. Additionally:
      i. Date evidence was received: pulls automatically from LIMS and prints on report.
      ii. Date(s) the evidence was opened and inventoried: in notes.
         1. cases must be assigned to an analyst in LIMS upon start of examination.
      iii. Date(s) when each test was performed: in notes.
      iv. Date, or range of dates of testing: pulls automatically from LIMS and prints on report.
         1. In the additional data field, enter the start and end dates of testing.
      v. Any supplementary pertinent case related information, or unusual circumstances with the case or appearance of evidence will be documented in the test record.
vi. Discrepancies in inventory of evidence will be changed in LIMS and noted in the test record.
   1. the evidence description in LIMS must reflect what is physically present in the evidence submission, even if different from the description provided by the submitting agency.
   2. items with high theft potential, such as controlled substances, money, or jewelry, must be verified by another employee of the laboratory as soon as practicable.

vii. Consultations: Documentation of significant interactions must be included in the test record notes and the Consultation box (check box located in the additional data field) selected. See LP.19 for more information on consultations.

viii. Any deviations from procedures will be documented and approved by the Supervisor, Forensic Manager, or Technical Lead prior to use in casework, and the justification will be included in the notes.

ix. Notes regarding other analysts who assisted on the case must be included (dated and initialed as necessary).
   1. Tests performed by an analyst other than the assigned case analyst will be reported.

x. Quality Log: populated by LIMS for every compared individual, and printed for verification documentation. See LP.24 for Quality Log procedures.
   1. If a verification was completed, the analyst(s) will be named in the Supplemental Information area of the report.

xi. Processing cases, when applicable, will have the following documented in LIMS:
   1. Presence of an appropriately labelled "Unloaded" sticker on gun containers (checkbox in the additional data tab in LIMS).
   2. Collection of biological evidence.
   3. Number and location of swabs collected.
   4. Presence of any visible prints prior to processing.
   5. Circumstances that interfere with or prevent the evidence from being processed.
   6. Type of processing techniques used, the sequence or order of techniques applied, and the results.
   7. Reagent Lot#s and expiration dates.
   8. Specific Equipment used.
   9. The results of control and blank reagent tests.
   10. Location of where latent prints were developed.
   11. Number of latent lift cards or digital images collected.
12. See LP.31 for more processing information and requirements.

c. Additional documentation to support tests included in the case file:
   i. **ABIS Printouts**: for required printout documentation see LP.28.
   ii. **ACE-V documentation**: for required GYRO documentation see LP.19.
   iii. Exemplars used for comparison testing; dated and initialed by analyst and verifier when applicable.
   iv. Digital images (See LP.45) and Latent lift cards (See LP.15).

1. Images of friction ridge evidence will be stored in Veripic. Refer to QA.21 for more information about uploading images to Veripic.

2. **Administrative Records**: records that do not constitute data or documentation resulting from testing. The following administrative records are in LIMS and are included in the test record:
   a. Communications (phone logs or emails from client agencies)
   b. Request form
   c. Chain of custody
   d. **Exception: Police reports**: to protect analysts from potential biasing information, the latent unit does not review and retain police reports prior to conducting tests. Police reports will not be contained within the test record.

B. **Procedure for entering information into LIMS**.

1. Enter the names of all **verifiers, processing staff, reviewers of processing results**, date(s) of testing, additional pages, and Unloaded checkbox for firearm evidence, in the additional data field of the Request tab.

2. Enter new individuals for comparison under the **Individuals Tab**, and relate to the latent request.

   a. Each person should be associated with the corresponding description of elimination, suspect, victim, or other. Persons may need to be added more than once if they are already associated with multiple requests. Include the name, DOB, and record number (ID#). An alternate name (AKA) will need to be entered separately to appear on the report. Additional DOBs or AKA information for subjects may be added as an Examination Result in LIMS.

3. **Latent Result** (Result Type): The information entered into this section will appear only in the notes.

   a. Select the appropriate evidence item, right click and select *add result*.
   b. From the Result Type drop-down menu, select *Latent Result*.
   c. Apply notes into the large note field and use the Ellipses button to add the check-box information, or to check that a consultation occurred on the case. This module is used to document a variety of notes, such as:

      i. Processing: notes are entered into notes field and use Ellipses button to: select all techniques used, processing results (see below for options),
and if photos were taken (yes or no).

ii. Any clearly specified notes documenting the ACE process (for example, analysis notes).

iii. The use of Photoshop to enhance images for comparison (*Ellipses*).

d. The ACE information entered into this field will be pulled into the Quality Log when the evidence has an associated compared individual.

e. Applicable notes and check boxes will need to be applied for each item of evidence.

f. Print Quality: use *Ellipses* button: apply anatomical location and suitability value of print.

   i. The *Screening* drop down menu is used when there is a latent print sufficient for comparison, to indicate the anatomy of the print (Fingerprint, Palm Print, Foot print, or Latent Print).

   ii. The following are *ScreenValue* drop down menu options (for descriptions of latent value determinations, see **LP.19**):

      1. **ABIS Value**: the latent print is sufficient for an ABIS search, and is also suitable for a comparison.

      2. **Identification Value**: the latent print is sufficient for identification or exclusion, but not an ABIS search.

      3. **Exclusion Value**: the latent print is sufficient for exclusion, but not an Identification or an ABIS search.

      4. **No Value**: no ridge detail, or partial ridge detail visible, but not suitable for further examination.

   g. The following are *Processing Result* drop down menu options:

      i. **No Ridge Detail Developed**: no latent prints (ridge detail) were developed.

      ii. **Ridge Detail Developed**: ridge detail developed and suitability will be determined subsequently.

      iii. **Ridge Detail**: ridge detail developed and suitability will be determined in subsequent report. This is only selected when a separate Comparison or ABIS request is generated in addition to the Processing report for the same case.

      iv. The drop down (Yes/No) selection for *Photos Taken* will be applied to indicate if photos were taken as a result of developing ridge detail.

4. **Latent Search (Result Type)**. This module is used to populate which latent database(s) were searched, and any clearly specified notes pertaining to the search of the database(s). A record of all database search transactions must minimally be documented in the notes. For more information on documentation requirements, see **LP.28**.

   a. Select the appropriate evidence item, right click and select *add result*.

   b. From the *Result Type* drop down menu select *Latent Search*. 
c. Enter search date(s), analyst(s) performing the search, and any search related notes into the large note field, select apply.
   i. The information entered into this section will appear only in the notes.

d. Select the Ellipses button.
   i. For each latent print, select the appropriate check box for the database(s) searched. If the search resulted in a hit, also select the check box from which database the hit occurred.
   ii. If a print is suitable for an ABIS search, but is identified and subsequently not searched, add the Latent Search result type without any boxes checked. This will automatically generate a statement on the report that the print was not searched through an ABIS database.

5. **Compared Individuals (Result Type)**. This module is used to populate comparison notes and results pertaining to the related compared individual.

   a. Select the appropriate evidence item, right click and select add result.

   b. From the Result Type drop down menu select Compared Individuals.

   c. Enter dates and other comparison notes into the large note field, select apply.
      i. This information will appear in the notes and will be pulled into the Quality Log.

   d. Select the Ellipses button.

   e. Select the appropriate name from the Compared Individual drop down menu.

   f. The following are the Stat Code drop down menu options:
      i. **ABIS HIT**: a hit was made from an ABIS search that resulted in an identification.
      ii. **Exclusion**: based on the available data, the named individual was excluded from the latent print.
      iii. **Inconclusive**: the named individual could neither be identified to, nor excluded from the latent print.
          1. include in notes, why the result is inconclusive, and to which area of friction ridge skin.
      iv. **INS**: the exemplars available were not sufficient to perform a comparison to the latent print.
      v. **MID**: the named individual was identified.
      vi. **Not Compared**: the individual was not compared to the latent print. Analysis documentation is not required when the latent is not compared.
      vii. **NRL**: no record (exemplar) was located for a comparison to the named individual.
      viii. **NRL/DOB**: a date-of-birth for the named individual was not provided by the requester, but is necessary to obtain exemplars.
g. When an identification is made, select the appropriate area of friction ridge skin from the following drop down menus:
   i. L/R
   ii. Anatomy

h. When an exclusion is made, complete the checkbox section to indicate how the comparison resulted in an exclusion.
   i. Level 1 = pattern/ridge flow differences
   ii. Level 2 = minutiae differences

i. Select the Hide DOB/ID box when the individual identified is a law enforcement officer, or when the date-of-birth and reference identification number needs to be suppressed from the report and notes.

j. Use the Insufficient Comment box for the following information, which when entered, will appear on the report:
   i. If the Stat code selected is INS, type in the specific area of friction ridge skin needed. For example, finger-tips or palm prints.
   ii. If the Stat code selected is NRL, type in the specific area of friction ridge skin needed. For example, palm prints or footprints.

6. **Notes (Result Type).** Information added into this field will only be printed in the notes, under the selected evidence description.

7. **Examination Results (Result Type).** Information added into this field is printed in the report and the notes. Information added to this field may include:
   a. Items that were not tested and why they were not examined.
   b. Statements indicating AKA or alternate date-of-birth information.
   c. Disposition of all evidence forwarded to another unit in the laboratory.
   d. Examinations performed by analysts other than the author of the report.

8. Under **Activities**, enter the time spent on the case with the appropriate date range and the type of examination.

9. After the examiner has determined that the case is complete, LIMS will be utilized to set the milestone to **Draft Complete**, and the report, note packet, and evidence (if applicable) will be submitted for review.
   a. Include the technical review worksheet with the case file for review. **LPF.50**

C. **Summary in Report**

1. **Comparison/ABIS:** A summary will appear on the report depending on selections made in LIMS under result type Compared Individuals. The summary automatically populates the report when:
   a. at least one identification is made.
   b. individual is completely excluded.
   c. individual is completely inconclusive.
2. **Processing:** A summary will appear on all processing cases. The default summary will state "The item(s) below have no useable prints" unless the following box(es) are checked in the request additional data field:

   a. **Usable Prints in Summary:** when this box is checked, the summary will state: "The item(s) below have useable prints." **Check this box when useable prints have developed on at least one of the items processed.**

   b. **Swab in Summary:** when this box is checked, the summary will state: "Item(s) were swabbed for potential DNA testing." **Check this box when at least one of the items were swabbed for DNA.**

3. No work reports will have no summary.

D. **ABIS Notification**

1. Agencies will be informed of their cases with potential matches in the Unsolved Latent Database (ULD) via an ABIS notification.

2. ABIS Notification reports require a verification and a technical review.

   a. the verifier will document their review of the hit on the ABIS hit print-out with their initials and date.

   b. the technical review will be reflected in LIMS as a milestone, or encompassed with the Administrative Review signature.

3. To complete the ABIS notification in LIMS, select **Case Synopsis** and include the following information, if known:

   a. the location or object from where the latent print was collected.

   b. the agency's item number(s) and the lab's item number(s).

   c. the name of the individual in the potential match.

   d. a disclaimer describing the qualitative significance of the positive association.

   e. a statement that the potential hit must be confirmed by resubmitting the evidence to the laboratory for examination.

   f. a disposition statement that the print record was deleted from the ULD database.

4. The notes to collaborate the ABIS Notification must include the ABIS hit printout(s), and may include other supporting documentation, such as the following:

   a. copy of lift card(s) from LIMS.

   b. report or notes from original request.

E. **In-Progress work halted**

1. If work must be stopped and can not continue without further information or clarification from the client agency, or for any other reason, staff will do either of the following:

   a. Report the work completed prior to stopping, and include in the report:

      i. a statement indicating what is needed to complete testing, or
ii. the reason(s) that work was halted and not completed.

b. Contact the client agency to get the required information or clarification to complete the work.

i. retain the communication documentation in the test record.

F. No Work Done Reports

1. When the Latent Unit determines that the requested work cannot or will not be performed, a report will be issued to the customer. The reason the requested work was not performed will be articulated in the report.

2. When the agency cancels a request for service and no work has been performed, a report will be issued. The identity of the individual cancelling the request will be included in the final report.

3. The following steps will be taken to document No Work Done Reports:

   a. In the Additional Data Field for the request in LIMS, select the "no work done" box.

   b. Select Edit Findings and choose Summary from the drop down to include the required information as stated above.

   c. If the unit chooses not to process an item, the evidence must be fully documented, including overall images, to be included in the test record.

   d. The report will also include a disposition of the evidence. For example, the item was forwarded to another unit for analysis.
I. Policy: Images of all friction ridge evidence must be legibly maintained in the test record. Latent lifts, or other friction ridge evidence, will be scanned on the EPSON perfection V700 PHOTO scanner for on-screen examination and retention in Veripic.

A. Procedure

1. All images scanned for the purpose of on-screen analysis and comparison will be scanned at a minimum of 1000 ppi.

2. Grayscale imaging will be set at a minimum of 8 bits.

3. Color digital imaging will be set at a minimum of 24 bits.

4. Friction ridge impression digital images, used for comparison purposes, will be stored and transmitted without compression, or with lossless compression. TIFF format is appropriate for scanning.

5. Refer to QA.21 for more information about uploading images to Veripic.

6. Refer to instruction manual for more information on the Epson scanner: INSLP.18

7. After opening the Epson Scanner software, make the following selections from the Epson Scan Screen:
   a. Mode: Professional Mode
   b. Document type: Reflective
   c. Document Source: Document table
   d. Auto Exposure Type: Photo
   e. Image type: 8-bit Grayscale or 24-bit Color
   f. Resolution: 1000 or 1200

8. Due to file size, the image may need to be cropped for a successful upload to Veripic.
   a. the non-evidentiary side of lift cards may be loaded into Veripic at a lower resolution, with image format type JPEG.

9. Select Scan (on the lower right corner of the screen).

10. A File Save Settings screen will open.
   a. Location: choose location to store the scanned image
b. **File Name:** choose a file name; for example Lab number

c. **Image Format:** TIFF

**B. Quality Assurance**

1. **Purpose**
   a. SWGFAST, SWGIT and NIST guidelines specify friction ridge impressions to be used for comparison purposes will be captured (color or grayscale) at a **minimum resolution of 1000 pixels per inch (ppi)** when the image is sized 1x or 1:1. While the 1000 ppi resolution standard permits the capture of level three detail in latent prints, it does not mean that any image recorded at a lower resolution would necessarily be of no value for comparison purposes.

   b. The relationship between nominal resolution and achievable resolution (resolving power) can vary greatly from different manufacturers. To determine that a scanner is capable of capturing an image at a given resolution, it is necessary to use a test target. The purpose of this procedure is to test the ability of the scanner to capture the necessary level of detail when viewed on a monitor.

2. **Frequency**
   a. In order to consistently and reliably capture images at the required resolution (1000 ppi), the scanners shall be tested **annually**.

3. **USAF 1951 Resolution Test Target**
   a. The test target used in the Latent Print unit is a 2" x 2" piece of glass from Edmund Industrial Optics with a positive (chrome on clear background) resolution test pattern. The pattern tests the resolving power of the scanner to capture latent prints for on screen analysis and comparison purposes.

   b. The format consists of six "groups" in three layers of patterns. The largest groups, forming the first layer, are located on the outer sides. The smaller layers repeat the same pattern but are progressively smaller towards the center. Each group consists of six elements, numbered one through six.

   c. Resolution for the test target is stated as line pair per millimeter (lp)/mm. The patterns repeat at a given frequency and may be referred to as cycles per unit of distance. Line pair means a black and white line.
d. Because nominal resolution of 1000 ppi corresponds to an achievable resolution of approximately 9.8 - 13 cycles per millimeter, any target within this range would be sufficient. The highlighted sections of the table correspond to an acceptable performance check (at least Group 3, Element 3 or higher). A performance check resulting in a resolution higher than 1000 ppi is also considered acceptable.

f. A resolution lower than the 9.8-13 cycles per millimeter (approximate 1000 ppi) is considered unsatisfactory. If there is an unsatisfactory performance check, the check will be repeated. If negative results continue, a Supervisor must be notified immediately and steps taken to correct the problem which may include, servicing or replacing the scanner(s).

4. **Procedure: Using the test target**

   a. Place the resolution test target face up on the scanner platen (similar to the placement of a latent print).

   b. Crop the image using the Preview feature to approximately 1 inch x 1 inch (similar to how a latent print would be cropped with a scale), then **Scan**.

   c. Open the image in the Windows Picture and Fax Viewer or in Photoshop.

   d. Do not manipulate or rotate the image.

   e. Scanners may have different resolutions in vertical and horizontal directions. To measure those independently, the resolution target has horizontal and vertical oriented bars.

      i. With the view set at 100% (original view), look **on the computer screen** for the element in which you can just differentiate with your eyes, two adjacent bars and still recognize the white gaps.

      ii. Read the element's number and group affiliation, then determine the resolution of the scanner using the reference table in the policy.

5. **Documentation**

   a. A **printscreen** of the test target in the viewer will be printed out and the element number and group affiliation from the test will be recorded. The date, staff member performing the check, and scanner # will be documented on the printout which will be retained in the maintenance binder with the completed maintenance log (**LPF.10**) for the appropriate scanner.

2. USAF 1951 SilverFast Resolution Target at www.silverfast.com

II. Images of documents may be scanned using the ESPON scanner for retention in LIMS.

A. Procedure: The following are setting selections for scanning documents into LIMS (for example: chain of custody or case-related email communication).

1. After opening the Epson Scanner software, make the following selections from the Epson Scan Screen:
   a. Mode: Professional Mode
   b. Document type: Reflective
   c. Document Source: Document table
   d. Auto Exposure Type: Photo
   e. Image type: 8-bit Grayscale
   f. Resolution: 200

2. Select Scan

3. A File Save Settings screen will open appear:
   a. Location: choose location to store scanned image
   b. File Name: choose file name
   c. Image Format: JPEG (*.jpg)
   d. The "show this dialog box before exit scan" checkbox should be checked.

B. Refer to QA.14 for more information about uploading images to LIMS.

END OF DOCUMENT
I. Policy: The results of all testing will be reported, and include all the information requested by the customer, and the information necessary for the interpretation of the results. The latent unit will provide a written test report to the customer that contains the results, conclusions, and interpretations reached, from all work performed, in a clear, accurate, and unambiguous manner. The Laboratory Information Management System (LIMS) is the primary location for laboratory case information.

A. General Information

1. Reports will be generated in LIMS for all testing completed by the latent unit. Latent service types include:

2. It is the responsibility of the analyst to ensure reports are accurate, error free, and clearly state the appropriate results for the type of request submitted.

3. The reported results will be supported by examination documentation, including:
   a. Computer generated print-outs, photographs, known exemplars, legible copies of latent prints, ACE-V documentations, quality logs, relevant email correspondences, notes and observations, or any additional documentation related to the case that supports the results and interpretations. The documents must be retained and retrievable.
   b. See LP.14 for more information about test records and entering results into LIMS.
   c. See FSD.43 for required information to appear on the report.

4. If an analyst, other than the author of the report, contributes to the testing of casework, that individual will be named in the report.

5. If an analyst from another unit performs testing on a latent request that is outside of the latent unit's scope of testing, the following is required:
   a. the results of the testing will be included in the report.
   b. the identity of the analyst performing the test will be in the report.
   c. the notes from the analyst conducting the test will include their initials, date(s) of testing, how test results should be reported, and a technical review of the work from another authorized analyst.
B. **Test Reports** will minimally include the following:

1. All test results for Processing, Comparison, and ABIS work that was done.

2. Complete description of the item(s) examined.
   a. For latent lift cards, if provided by the agency or lab staff, the location from where the lift was collected will be denoted in quotation marks. For example, latent lift card from "car door."
   
   i. When location information is not provided on the lift card, the description should indicate: *lifted from undisclosed location with or without a sketch*; and quote the location indicated on the request form, if provided.
   
   b. If an item was submitted for testing but was not examined, the report will indicate that the evidence was not processed for latent prints.

3. Print quality, or level of suitability, will be given for each latent print, and lift card or digital image, in accordance with LP.19.

4. Processing techniques used, including any swabs collected and the disposition of the swabs.

5. Databases in which the print(s) was searched (scope of the search), including the search results (Hit/No Hit).

6. Comparison examination results, including the name, date of birth, and record number (if one is located), for all individuals requested to be compared.
   a. Examinations that result in an **Identification** must include the area of friction ridge skin that was identified. For example, the Right Thumb or Right Palm.
      
      i. A qualifying statement regarding the **strength of association** for an interpretation decision of identification is provided in the Supplemental Information area of the report.
   
   b. Examinations that result in an **Exclusion** must indicate that the individual was excluded from the latent print.
      
      i. An exclusion decision is defined in the Supplemental Information area of the report.
   
   c. Examinations that result in an **Inconclusive** must include a qualification statement supporting the decision.
      
      i. A qualification statement is reported on the Supplemental Information area of the report, but the analyst will specify details regarding the inconclusive decision in their notes.
   
   d. If exemplars are deemed to be insufficient to complete a comparison, the report will specify the area of friction ridge skin that is required for comparison.
   
   e. If exemplars were not located, the report must state that exemplars were not located and would be needed for comparison.
7. The report will state when a latent print(s) is "Not Compared" to an individual(s) under the following circumstances:
   a. Not compared same surface: when additional latent prints are found on the same surface as an already identified latent print. See LP.19 for more information.
      i. exceptions: if the individual identified is the victim, or the case is a homicide.
   b. ABIS hit: when there has been an ABIS hit resulting in an identification, the remaining (non-ABIS quality) prints may not be compared to that individual. See LP.28 for more information.
      i. exceptions: if the ABIS hit is to the victim, or the case is a homicide.

8. If testing was carried out in a different location than the laboratory, the location of testing must appear in the body of the report.
   1. The name and address of the laboratory, where most testing occurs, already appears on the report header.

9. A description of, the condition of, and unambiguous identification of the items tested, items received (including items not tested), and items created (that were or could be tested).

10. See FSD.43 for information on releasing results prior to completion of a test report, and distribution of test reports.

C. Supplemental Information on report contains the following:
   1. Client address.
   2. Receipt of Evidence information.
   3. Outer package(s) were received by the laboratory in tape-sealed condition.
   4. Date(s) of testing.
   5. Evidence not pending further laboratory analysis will be returned to the requesting agency or Contra Costa County Property Services.
   6. A statement to resubmit evidence if further comparison testing is needed on unidentified prints.
   7. Database statements:
      a. A statement indicating why a latent print may not have been identified as a result of a latent print search.
      b. The latent prints searched and not identified are enrolled to the unsolved latent database and continue to search until deleted.
   8. The latent unit will routinely search for known exemplars throughout the State of California.
   9. Statements that define:
      a. Identification
      b. Exclusion
c. Inconclusive  
d. Sufficient and Insufficient print quality

10. The names of staff assisting with latent testing.

11. Statement regarding Photoshop enhancements.

D. **No work and partial work reports**

1. If laboratory staff or the client agency determine work is no longer going to be done, after a request for service has been generated, a report will be issued by the latent unit.
   a. The reason the requested work was not performed will be articulated in the latent report.
   b. If the agency cancels a request for service, the name of the individual cancelling the request will be included in the latent report.
   c. For procedures on completing a "no work" report, see LP.14.
   d. If work is halted, results of all partial testing will be reported, as well as the reason for stopping the work in progress.

E. For information on **Amended Reports, Confidential Reports, and Restricted Reports**, see FSD.43.

F. For information on **Latent Discovery reports**, see LP.70 and FSD.45.

G. For information on **ABIS Notification reports**, see LP.14.

H. For information on **Latent Proficiency and Competency reports**, see LP.63.

END OF DOCUMENT
I. Policy: The maintenance of equipment will be performed by Division Staff or outside service technicians to ensure their proper working order. All maintenance records will be retained in the corresponding equipment maintenance log which is stored in the Latent Unit - Equipment Maintenance Binder. ABIS maintenance is documented on the ABIS Maintenance Log located on the G-Drive in the Latent Folder. Maintenance records include calibration dates and results, adjustments or modifications made, damage to and repair of, planned intermediate checks and cleaning details, and other similar documentation. The Latent Unit will maintain a list of approved Equipment including Software/Firmware, Reagents, and Instruments. The list will include the equipment identity, manufacturer, version, or other unique identifying information.

A. Routine Cleaning of Equipment

1. Routine cleaning of equipment, work stations and work surfaces prior to use to prevent contamination and maintain clean work areas is not required to be documented.

2. All equipment will be checked for cleanliness and cleaned by users on a routine basis. Some examples include:
   a. wiping surfaces down with dilute (10-20%) bleach solution
   b. using soapy water to clean respirators
   c. cleaning camera or microscope lenses
   d. cleaning scanner glass

3. Refer to LP.64 for contamination prevention requirements.

B. Equipment Maintenance

1. If a problem with a piece of equipment or system is detected, the piece of equipment will be taken out of service, and labeled as such, until functioning properly.
   a. The Unit Supervisor or Technical Lead will be notified of any equipment failure or improper function.
   b. Actions taken to repair or correct the problem will be documented in the corresponding maintenance log.

C. Equipment Use and Maintenance including Intermediate Checks

1. Digital Scale- Balances are used to weigh latent processing chemicals. The amount of chemical used to prepare processing reagents is not a critical measurement and there is no acceptance criteria for their purpose in the Latent Unit. See table below.
   a. If there is an indication of a technical issue, the digital scale will be checked in-house against a series of NIST (National Institute of Standards and Technology) traceable reference standards. Records of the calibration checks will be maintained in the Latent Print Unit Maintenance Binder (Digital Scale Maintenance Log). LP.03
   b. To prevent unintended adjustments after yearly calibrations, the balance will be left in place and not moved from it's location in the Latent Unit.
   c. Annually, the balance is serviced and calibrated by an external calibration service that is NIST compliant. A service record sticker will be placed on the instrument by the vendor documenting the re-certification and due date of next calibration. A copy of the annual NIST certification will be maintained in the Latent Print Unit Maintenance Binder including the calibration results and any adjustments made.

2. Chemical Fume Hoods- The filtered fume hood enclosures are used to prevent unnecessary exposure of hazardous materials to staff.
   a. Ongoing, when an issue with the performance of the hood is detected or suspected prior to the annual scheduled maintenance, such as the smell of vapors outside the hood, the air flow should be checked with an anemometer. Using the anemometer/flow meter, check the face velocity of air drawn at the sash opening of the fume hood. If the minimum average face velocity is less than 100 linear feet per minute, the Supervisor must be notified and the vendor may be contacted for service.
   b. Monthly, the air flow will be checked with an anemometer or flow meter and records maintained in the Latent Print Unit Maintenance Binder. The face velocity of the air drawn through the sash should be 100 linear feet per minute or greater. If the air flow is not within the specified limits, the filter may need to be changed. Notify the Supervisor and the vendor may be contacted for service as needed.
   c. Annually, hoods are checked for proper air flow and certified. A service record sticker will be placed on the hoods by the vendor documenting the re-certification. The annual re-certification document(s) will be maintained in the Latent Print Unit Maintenance Binder. The filters will be replaced by the vendor as needed when proper air flow is not being met. The air filters (pre-filters) should also be changed annually by division staff.
   d. All maintenance will be documented in the Latent Print Unit Maintenance Binder (Fume Hood Maintenance Log). LP.12

3. Microscopes
   a. As needed, the microscope may be cleaned.
i. Use canned air to blow dust off the eyepieces, the stage and the objectives.
ii. Use a non-abrasive wipe (e.g. Kimwipe) to clean the objectives, eyepieces, stage, and body.
iii. A soft cloth dampened with water or a mild cleaner may be used as needed.
iv. The microscope should be covered with a dust cover when not in use.

b. **Annually**, a preventative annual external maintenance check is conducted on the stereo-microscopes to ensure compliance with specifications by a qualified vendor. Records of this will be maintained on the microscopes and on the Microscope Maintenance Log (LPF.06) located at the workstation near each microscope.

c. Microscopes are used to magnify latent prints for better visualization and do not have acceptance criteria for their purpose in the Latent Unit.

4. **Respirators**-N95 and Full Face Respirators

a. **Annually**, a medical evaluation will be completed to determine if there are medical issues that would prevent staff from performing their duties while wearing the respirator. After successful completion of the medical evaluation, a fit test will be performed to ensure proper fit of the respirator. See SAF.08.

b. N95 Respirators
   i. Ensure a proper seal prior to use.
   ii. Dispose of respirator after use.

c. Full Face Respirators
   i. Ensure the respirator forms a tight seal before use.
   ii. Dispose of filter cartridge after use.
   iii. Use positive and negative pressure to test respirator. If proper suction occurs the respirator may be used. If proper suction does not occur, re-tighten straps and test again. If a proper seal is not achieved, do not use the respirator and inform a Supervisor or Manager.

5. **Comparator**

a. **As needed**, maintenance performed will be documented in the Latent Print Unit Maintenance Binder (Comparator Maintenance Log). LPF.09

6. **Ridge Pro Plus Magnifier**

a. **As needed**, maintenance performed will be documented in the Latent Print Unit Maintenance Binder (Ridge Pro Plus Maintenance Log). LPF.46

7. **Fingerprint Brushes**

a. **Periodically**, brushes will be discarded as needed to prevent cross contamination, or if degradation of latent prints may occur due to the condition of the brush.

8. **Super Glue Wands**

a. **With every use**, a performance check is completed using a test print on a test strip, and the results documented in the case record.

b. **As needed**, maintenance performed will be documented in the Latent Print Unit Maintenance Binder (Superglue Wand Maintenance Log). LPF.17

9. **Canon Digital Cameras** - The cameras are used to capture images of the evidence and to photograph latent prints developed on items during latent print processing. SWGIT, NIST, and SWGFAST guidelines recommend ensuring images used for comparisons are captured at minimum resolution of 1000 ppi. Though cameras are marketed at a given resolution, it is understood that actual achieved resolution may not be the same.

a. **Annually**, each camera used in casework will be checked using a USAF 1951 resolution target to ensure the achieved resolution is at least 1000 ppi. Records of the achieved resolution will be maintained in the Latent Print Unit Maintenance Binder on the corresponding Camera Maintenance Log. LPF.08

b. **As needed**, maintenance performed will be documented on the corresponding camera maintenance log in the Latent Print Unit Maintenance Binder.

10. **Rofin Poli-Flare**

a. **With every use**, a performance check is completed using a chemically processed test strip and the results documented in the case record.

b. **As needed**, maintenance performed will be documented in the Latent Print Unit Maintenance Binder (Poli-Flare Maintenance Log). LPF.15

11. **Rofin Polilight**

a. **With every use**, a performance check is performed using a chemically processed test strip and the results documented in the case record.

b. **As needed**, maintenance performed will be documented in the Latent Print Unit Maintenance Binder (Polilight Maintenance Log). LPF.16

12. **Coherent TracER Laser**

a. **With every use**, a performance check is completed using a chemically processed test strip and the results documented in the case record.
14. Foster + Freeman Superglue Chambers

a. **As needed**, maintenance performed to the Laser will be documented in the Latent Print Unit Maintenance Binder (Coherent TrasER Laser Maintenance Log). LPF.48
   
   i. A service call may be made to Coherent (Arrowhead Forensics or other service vendor) as necessary.

b. **Periodically** some maintenance may be needed, however the Laser is designed to be relatively maintenance free.
   
   i. The filter in the rear of the laser box should be monitored and occasionally wiped for dust to prevent it from becoming clogged. If the filter becomes clogged, overheating may occur, however the built in thermal interlock will prevent damage to the Laser.

   ii. The output optic on the hand piece may be gently wiped occasionally with a non-scratch cloth.

13. **Automated Biometric Identification Systems (ABIS)** - The ABIS used in the Latent Print Unit are maintained by technical services, Records and Identification Unit, Cogent, the California Department of Justice and the FBI.

   a. **Quarterly**, performance checks will be done by searching one latent fingerprint and one latent palm print known to have a corresponding exemplar enrolled in the Cogent database. The performance check need only be done on one work station as CAFIS is the same at each work station. The performance check and other maintenance will be documented on the ABIS Maintenance Log located on the Sheriff's Network, in the Latent Folder.

   i. Ongoing performance checks are done by DOJ and FBI to ensure proper function.

b. Gateway and ULW searches testing the DOJ and FBI (NGI) databases are not permitted outside of new software upgrades. Only the Local CAFIS database may be tested regularly.

   i. The fan filter in the rear of the laser box should be monitored and occasionally wiped for dust to prevent it from becoming clogged. If the filter becomes clogged, overheating may occur, however the built in thermal interlock will prevent damage to the Laser.

   ii. The output optic on the hand piece may be gently wiped occasionally with a non-scratch cloth.

14. Foster + Freeman Superglue Chambers

a. **Monthly**, if in use, the glass windows will be cleaned and decontamination performed using the UV lights. Any superglue residue on the wire mesh of the humidity sensors should be cleaned using a soft brush; the mesh may be sprayed with compressed air (while wearing appropriate protective gear) to remove any lodged particles.

b. **With every use**, a performance check is completed using a test print on a test strip and results are documented in the case record.

c. **As needed**, any maintenance required and performed will be documented on the appropriate log. Examples may include:

   i. **Changing the door seal**. Appearance of white deposits may be an indication of superglue fumes escaping indicating a poor seal. Staff may phone consult with the manufacturer to change the seal in-house. Door seals may need to be replaced every 2-3 years.

   ii. **Cleaning the fans**: MVC3000 has a fan in the upper portion of the door and MVC5000 has two fans inside the cabinet door. The fans should spin freely by hand. Compressed air may be used to remove any particles lodged inside (while wearing appropriate protective gear).

   iii. **Changing the batteries on the control unit**: An "ERROR" or "REPLACE BATT" message indicates new battery is needed. The battery life is approximately 3 years.

   d. **Annually**, the hot plate temperature and chamber relative humidity (RH) will be checked using the Fluke t3000 K-type thermometer and the Vaisala HM40 hand-held Thermometer-Hygrometer. The two instruments may be used simultaneously during one chamber cycle.

   i. **Fluke t3000 K-type Thermometer**:

      1. Remove the hot plate ring and secure the end of the probe to the center of the superglue hot plate using heat resistant metal duct tape.

      2. Ensure the end of the probe is making tight contact with the surface of the hot plate and add another piece of tape to ensure the probe is secure. Replace the ring and turn on the Fluke thermometer.

      3. Set the thermometer to Celsius temperature reading and rest the thermometer outside of the chamber.

      4. Close the door and start the glue cycle. Begin to take readings from the chamber display and the Fluke thermometer.

      5. **Acceptance Criteria**:

         During the glue cycle, the temperature reading must reach within ±10°C of 120°C, but doesn't need to stay for the duration of the cycle, to be considered passing. If the chamber is not within this tolerance after two attempts, a service call will be needed and the instrument will be taken out of use.

   ii. **Vaisala HM40 hand-held Thermometer-Hygrometer**:

      1. Turn the instrument on. The display should automatically turn on to the temperature and relative humidity readings screen, and should appear in Celsius (°C). If not, adjust the settings with the up and down arrows.

         1. Refer to the user guide or the "quick guide" located with the thermometer-hygrometer in the carrying case for more information on device settings.

      2. Place the Thermometer-Hygrometer on the center of the center most shelf in the chamber, positioned so the display can easily be read through the cabinet window.

      3. Fill the cup with deionized water, close the door and begin the cycle.

      4. **Acceptance Criteria**:

         Once the chamber reaches 80% RH (relative humidity) it automatically switches from the humidity cycle to the glue cycle. During the humidity cycle, the humidity reading on the Vaisala instrument must be within ±10% RH of the chamber display of 80% RH to be considered passing. If the chamber is not within this tolerance after two attempts, a service call will be needed and the instrument will be taken out of use.

   iii. **Troubleshooting**

      1. If necessary during a service call, staff can access the service mode sequence. The chamber must be in the "Ready" mode, then press the small round buttons ("Aux," "Aux," "Aux") on the chamber panel in the following sequence: "Aux," "Aux," "Aux," "Aux." The service menu will appear with functions listed on the left and factory settings on the right.
2. If the keypad becomes unresponsive, hold down the on/off button until it beeps multiple times. If this does not work, hard reset the cabinet by turning off, then back on, on the 24 volt unit (gray box on the controller).

e. **Filters**: The superglue chambers are self-contained with carbon filters to protect employees from potentially dangerous superglue fumes. The safe use of the chambers requires replacing the active carbon filter every 75-80 cycles, as recommended by the manufacturer.
  
i. The user is responsible for checking the cycles remaining to ensure the filters get changed appropriately. The number of cycles left prior to the filters needing replacement can be checked upon turning on the unit or bringing it out of "stand-by" mode.
  
ii. Follow the instructions in INSLP.12 (MVC5000) and INSLP.14 (MVC3000).
  
iii. To "re-set" the counter to 80, after the filters have been changed, the equipment must "filter fault" by having the filters removed from the chamber (while the unit is off or in "stand-by" mode). Without the filters in place, turn the unit back on, and navigate through the menu on the display pad to the "renew filter" screen and press the "up" arrow to change from "NO" to "YES", then exit the menu screen. Turn the equipment to "stand-by" mode and replace the fresh filters. When powered back on the number of cycles should automatically reset to 80.
  
f. All maintenance will be documented in the Latent Print Unit Maintenance Binder, on the corresponding **Superglue Maintenance Log**. Foster + Freeman MVC3000 (LPF.04) or Foster + Freeman MVC5000 (LPF.05).

15. **Scanners**- The scanners located at each work station are used to scan latent prints into ABIS, Veripic, and/or for ACE-V processing and documentation. SWGIT, NIST, and SWGFAST guidelines recommend ensuring images used for comparisons are captured at minimum resolution of 1000 ppi. Though scanners are marketed at a given resolution, it is understood that actual achieved resolution may not be the same.

a. **Annually**, each scanner used in casework will be checked using a USAF 1951 resolution target to ensure the achieved resolution is at least 1000 ppi. Records of the achieved resolution will be maintained in the Latent Unit on the corresponding **scanner maintenance log** (LPF.10) located in a binder by each scanner. For further instructions on using the test target see LPF.45.

16. **CARON Heat and Humidity Development Chamber**

a. **Annually**, the temperature and humidity will be checked using the **Vaisala HM40 hand-held Thermometer and Humidity Meter**. The results will be documented in the Latent Print Unit Maintenance Binder (Chamber Maintenance Log) **LPF.13**

i. **NOTE**: if the CARON chamber is not in use for casework, the annual temperature and humidity check does not need to be performed. However, an intermediate check following the directions below will be done prior to use in casework if it has been longer than 1 year since the equipment was checked.

ii. To use the Vaisala thermometer-hygrometer, lay the probe inside the chamber as close to the center as possible. Leave the display outside of the chamber and close the door.

iii. Turn the instrument on. The display should automatically turn on to the temperature and relative humidity readings screen, and should appear in Celsius (°C). If not, adjust the settings with the up and down arrows.

1. Refer to the user guide or the "quick guide" located with the thermometer-hygrometer in the carrying case for more information on device settings.

iv. **Acceptance Criteria**: The instrument temperature reading must be within ±10ºC of the chamber temperature display, once the chamber reaches the set points, to be considered "passing." If the chamber is not within this tolerance after two attempts, a service call will be needed and the instrument will be taken out of use.

1. The temperature of the chamber will be checked at the two set points used in casework: 100ºC and 85ºC.

v. **Acceptance Criteria**: To check the humidity, set the chamber to 85ºC and 65%RH. Once the chamber display indicates 85ºC and 65%RH, take 3-5 RH readings with the thermometer-hygrometer over five minutes. The average RH reading must be at least 60%RH to be considered passing. If the chamber is not within this tolerance after two attempts, a service call will be needed and the instrument will be taken out of use.

b. **As needed**, maintenance performed will be documented in the Latent Print Unit Maintenance Binder.

c. **Periodically**, the window should be cleaned of any residue build up.

d. **With every use**, a performance check is completed using a test print on a test strip and results are documented in the case record.

17. **Fluke t3000 K-type Thermometer**

a. **Biennially (once every two years)**, the thermometer is calibrated by an external calibration service.

b. The calibration will be NIST traceable but **does not** need to be ISO 17025 compliant. See table below.

c. Calibration results may be evaluated for acceptance even if the result falls outside the originally stated tolerance criteria for this instrument.

18. **Vaisala HM40 Hand-Held Thermometer-Hygrometer**

a. **Biennially (once every two years)**, the humidity and temperature meter is calibrated by an external calibration service.

b. The calibration will be NIST traceable but **does not** need to be ISO 17025 compliant. See table below.

c. Calibration results may be evaluated for acceptance even if the result falls outside the originally stated tolerance criteria for this instrument.

19. **Reagents**: Refer to LPF.32

20. **External Calibration Table for all applicable equipment in Latent Unit**: Objective evidence for NIST traceable calibration is located in the maintenance binder.

END OF DOCUMENT
I.  Introduction

A.  Friction ridge impression examinations are conducted by examiners using the Analysis, Comparison, Evaluation, and Verification (ACE-V) method, which includes both qualitative and quantitative aspects to interpret data (details within friction ridge skin) that ultimately lead to conclusions.  ACE is not generally applied as a strictly linear process because it may include a return to any previous step of interpretation. Application of ACE includes observations, measurements, assessments, decision-making and documentation, which are enabled by the education, training, skill, and experience of the examiner.[1]

B.  The examination of friction ridge impressions and the resulting conclusions are based on examiner interpretations of ridge flow and ridge paths; the location, direction, and spatial relationships of minutiae; and ridge structure present in a print. [1]

C.  Unless reported otherwise, all latent lift cards, digital images, castings, or other forms of media generated internally (from latent print processing at the laboratory or at a crime scene), or submitted to the lab from outside agencies, will be analyzed to determine suitability and value of any latent prints present, as well as examined to discover potential donors of the friction ridge skin.

D.  An analyst should seek the advice of another competent analyst if there is a question of whether or not a latent print is of value.

II.  Examination Factors for Data Interpretation

A.  The following factors affect the qualitative and quantitative aspects of friction ridge impressions. Examiners will understand these factors, recognize that they occur in friction ridge impressions, and understand how they influence friction ridge impression reproducibility. These factors may cause an apparent dissimilarity between impressions from the same source. Failure to properly assess the occurrence and influence of these factors could result in misinterpretation. When applicable, the following factors must be considered in all steps of the ACE-V method:

1.  Anatomical aspects include the condition of the skin (e.g., scars and warts) and the morphology of the hand and foot relative to the shape and contour of the substrate.

2.  Transfer conditions include pressure applied during transfer, slippage or twisting, sequence of deposition (e.g., double taps and overlays) and an understanding of the limitations of friction ridge pliability.
3. Matrix includes bodily secretions and contaminants (e.g., sweat, blood, paint, dirt, oil, grease).

4. Detection techniques can be one or more of the following:
   a. optical (e.g., light sources and illumination techniques)
   b. physical
   c. chemical processing techniques

5. Recording or preservation techniques (e.g., photography, lifting, live-scan, ink).

6. Substrate (e.g., porous, non-porous, semi-porous, smooth, rough, corrugated, pliable, or textured surfaces).

7. Environmental conditions (e.g., protected, unprotected, wet, dry, cold, hot).

III. Levels of Friction Ridge Impression Detail for Examination

A. Level 1 detail refers to the overall ridge flow.

B. Level 2 detail refers to individual friction ridge paths, friction ridge events (e.g., bifurcations, ending ridges, dots, and continuous ridges) and their relative arrangements.

C. Level 3 detail refers to ridge structures (edge shapes and pores) and their relative arrangements. Creases, scars, warts, incipient ridges, and other features may be reflected in all three levels of detail.

IV. Procedure for Friction Ridge Impression Examinations (ACE-V Method) and Data Interpretation

A. Analysis
   1. The analysis phase leads to the determination of suitability. The determination of suitability is based on the assessment of the discriminating strengths of the features and their arrangements. Suitability is the determination that there is adequate quality and quantity of friction ridge features in an impression to continue to the next step.

   2. Analysis includes the assessment of the impression to determine its value based on Level 1, 2, and 3 detail. The assessment is affected by other relevant information and factors as described above in section II, as well as possible anatomical origin and orientation.

   3. The examiner will assess the friction ridge skin features and assign tolerances to the print to determine suitability. Tolerance is the allowance of variation in appearance of friction ridge features that will be accepted during comparison, should the corresponding print be available.[1]

   4. If the impression is determined not to be suitable for comparison, the examination will stop at the analysis phase and will be reported as such.

   5. Quality
      a. Quality is the assessment of the clarity of ridge features. Generally as quality increases so does the discern-ability and reliability of the ridge features. It is recognized that quality is not necessarily constant.
throughout an impression. The assessment of quality may represent just the areas of highest quality, a range of qualities, or a map or rating system of quality of various regions in a single impression.

b. The level of quality determines the degree of tolerances that will be used during the comparison process. High quality will lead to low tolerances and conversely low quality will require high tolerances.

6. Quantity
   a. As applied in this section, quantity is the number of ridge endings, bifurcations, and dots (minutiae) in contiguous ridges, determined without any reference to known impressions. All minutiae are considered here including indistinct minutiae for which type or exact location cannot be established.

b. It is recognized that this is an incomplete measure of the overall quantity of detail in a print. Level 2 detail encompasses more than minutiae counts (including the ridge path, areas with open fields, and selectivity of minutiae). Minutiae counts remain, however, as a discrete, measurable aspect of all prints and their enumeration is part of the systematic, formal consideration of quantity.

7. Data to be considered during the analysis phase include but are not limited to:
   a. Overall shape of the latent print and pattern, if known
   b. Anatomical region
   c. Potential orientations
   d. Rarity and specificity of: ridge flows, ridge counts, pattern regions, the shape of the delta, ridge lengths, location and type of minutiae, crease patterns and shapes, and scar detail
   e. Delta location
   f. Sequences of ridge lengths
   g. Robustness of: ridge path curvature and angles, minutiae shapes, ridge and furrow widths, edge shapes, and pore positions
   h. Presence and clarity of incipient ridges
   i. Presence and significance of temporary features (temporary damage or disease)
   j. Tolerance for within source variability due to distortion
   k. Potential for between source similarity

8. **Criteria for Determining Latent Print Suitability** (Note: The listed criteria are based upon the combined experience of the Latent Print Unit and are quality assurance standards adopted to prevent false conclusions and provide a minimum standard with which to evaluate analysts' determination of suitability for comparison).
   a. **ABIS Value**: observation determination during analysis, prior to comparison:
i. Should have at least ten clear minutiae for fingers or palms, **AND** one or more of the following:
   1. Discernible distal orientation.
   2. At least one focal point (e.g., core, delta, crease, scar).
   3. At least one region of robust and distinct target data.

b. **Identification Value**: minimum number of discernible minutiae located during analysis, prior to comparison:
   i. Eight minutiae **AND** one or more of the following:
      1. Discernible distal orientation.
      2. At least one focal point (e.g., core, delta, crease, scar).
      3. At least one region of robust and distinct target data.

c. **Exclusion Value**: the determination that the latent print likely contains insufficient detail to identify but has clear level one detail and/or enough clear minutiae to potentially exclude an individual. In analyzing a latent print, if it is determined there is sufficient information to exclude even one subject, that latent print will be marked "**Exclusion Value**".
   i. A latent print of this value has limited comparison potential, and will likely not be able to identify an individual.
   ii. The following will be considered in assessing exclusion value:
      1. Use of first and/or second level detail in the latent print to exclude a subject
      2. Location and orientation of latent print
      3. Focal points

9. **Discernible Detail**
   a. Discernible minutiae do not necessarily have to be continuous if the analyst can explain the breaks in the ridge paths (e.g., "ridge shift consistent with a decrease in pressure and movement").

10. **Flexibility**
   a. Due to the extreme variability of latent prints, a print that does not meet the above-listed criteria may be marked suitable for comparison at the discretion of the case analyst.
      i. For instance, a latent print may lack eight minutiae, but have other significant data (e.g., incipient detail, scar detail, or seven highly selective minutiae) or high clarity. The additional data will contribute to the determination of suitability for comparison.
      ii. The analyst will document which data permitted the determination of suitability for comparison when a latent print does not meet the above-listed criteria.

11. **Search parameters**
a. Markings and notations should indicate how the analyst interpreted the anatomical region and distal orientation of the print. Any uncertainty should also be captured or noted.

b. Latent prints determined to be of comparison value will be marked with a red alpha or numeric character, following the LIMS designated itemization scheme. Prints meeting the ABIS value criteria will be marked with an asterisk after the alpha/numeric identifier (e.g., A*). See LP.10 for more information on LIMS itemization for latent prints.

12. Not suitable for comparison

a. A print is referred to as having "no value" (for comparison) when no information is present in the latent print that can be used in any of the comparison groups specified above. This assessment is made when a print lacks sufficient and/or clear first and/or second level detail.

B. Comparison

1. The comparison phase involves observations and collection of data of similarities and dissimilarities between the latent print and the exemplar print.

2. Certain orientation focal/anchor points such as recurves, deltas, creases, and scars may provide specific guidance as to where to begin the comparison. If the analysis phase provides indicators as to the probable anatomical area, a side-by-side comparison with the appropriate area of the known print will be conducted. In the absence of indicators, all areas of available known impressions must be compared.

3. Comparison is accomplished through the side-by-side observation of all levels of details to determine whether the two impressions are in agreement or disagreement based upon features, sequences, and spatial relationships within the tolerances of clarity and distortion.

4. While there are many tools available for analysts to conduct a side-by-side comparison (i.e., hand held magnifying glass, fingerprint comparator etc.), latent prints of Exclusion Value or of overall low quality will be compared to the known exemplar by scanning and viewing on the monitor or by using Photoshop for optimal visualization.

5. Comparison begins with the determination of dissimilarity or similarity between two impressions at Level 1. If similarity is determined within tolerance at Level 1, a target group is selected from the features observed during the analysis phase and is then searched within the selected area of the other impression. When similarity with the target group exists, additional continuous arrangements of features are compared between impressions in a cyclical or recurring process from the unknown to the known impression to evaluate disagreement or agreement between the impressions. The process can extend to comparing features in the known with features in the unknown that were reanalyzed during the comparison phase. If the initial target group is not found, alternate target groups will be selected and compared.

6. Observation of agreement or disagreement between the impressions initiates the evaluation phase.

C. Evaluation
1. In the evaluation phase, the analyst will ultimately decide whether the latent print is from a different source or the same source as the exemplar print; is inconclusive to the exemplar print; or if better exemplars are needed.

2. The conclusions are based on the following premises:
   a. Friction ridge skin bears an extremely complex, unique and persistent morphological structure.
   b. Notwithstanding the pliability of friction ridge skin, the contingencies of touching a surface, and the nature of the matrix, an impression of friction ridge skin structure may be left following contact with a surface.
   c. The impression may display features of varying quality (clarity of ridge features) and specificity (weighted values and rarity).
   d. Notwithstanding variations in clarity and specificity, the unique aspects of friction ridge skin may be represented as highly discriminative features in impressions.
   e. An impression that contains sufficient quality and quantity of friction ridge features can be individualized to, or excluded from, a source.

3. Conclusions
   a. **Identification**: the determination the latent print and an exemplar print were made by the same source.
      i. The cumulative weight of the data in the latent print and exemplar print must be sufficient to:
         1. support the conclusion the impressions were made by the same source
         2. reduce the possibility the impressions were left by different sources to the point it can be disregarded
      ii. A *quality assurance standard* requiring a minimum of eight discernible minutiae with the same spatial relationship, type and direction and the overall ridge path in agreement to conclude identification was adopted to prevent false conclusions and provide a minimum standard with which to evaluate analysts' determination of identification.
      iii. Flexibility
         1. Due to the extreme variability of latent prints, latent print comparisons that do not meet the above-listed criteria may result in an identification at the discretion of the case analyst under certain circumstances, such as:
            1. A latent print may lack eight minutiae, but have other significant data (e.g., incipient detail, scar detail, or seven highly selective minutiae) or high clarity. The additional data will contribute to the determination of identification.
2. The analyst will document which data permitted the case analyst to determine the latent print was suitable for comparison and document the data used in both the latent print and the exemplar print to conclude identification when an examination does not have eight minutiae in agreement.

b. **Exclusion:** the decision that there are sufficient features in disagreement to conclude the two areas of friction ridge impressions did not originate from the same source.

   i. The cumulative weight of the data in the latent print and the exemplar print must be sufficient to support the conclusion that the impressions were made by different sources.

   ii. In order to render an exclusion, the analyst must ensure all necessary anatomical regions are clearly recorded for comparison within the exemplar prints.

   iii. First and/or second level detail will be used to reach an exclusion decision. The following are required and must be documented, though neither on their own is sufficient for an exclusion:

   1. **An anchor point** (for example, delta, core, major crease, distinctive ridge flow).

   2. **Second level detail around the anchor point.**

   iv. The analyst will use more than one target group of second level characteristics before reaching a conclusion of exclusion, whenever possible.

   1. Using multiple groups ensures that sufficient features are in disagreement.

c. **Inconclusive:** the conclusion by an examiner that an unknown impression of comparison value cannot be identified to or excluded from an individual.

   i. Reasons for an inconclusive decision may include:

   1. The latent print lacks sufficiency of detail and/or clarity for Identification or Exclusion.

   2. Corresponding features are observed but not sufficient to individualize.

   1. Data exists to support the inclusion of exemplar print(s) as a potential source of the latent print; however, the quantity, clarity, and/or selectivity of the available corresponding data is not strong enough to disregard the possibility that another source could have left the print.

   2. This potential source of the latent print may be reported to the agency if analyst documentation supports such a conclusion.
1. This conclusion will be verified.

3. Dissimilar features are observed but not sufficient to exclude.
   1. This potential exclusion of the individual from of the latent print may be reported to the agency if analyst documentation supports such a conclusion.

1. This conclusion will be verified.

ii. Inconclusive results may only be rendered after the analyst has determined that additional exemplars will not permit a definitive conclusion.

4. Other possible results from comparison:
   a. Insufficient Exemplar(s): the available exemplars are inadequate for comparison due to lack of quality and/or quantity of detail.
      i. The latent print may or may not have limited detail in agreement with the exemplar prints.
      ii. Additional exemplars of the friction ridge skin will be required and may permit the analyst to reach a definitive conclusion.
      iii. The report and notes indicate better exemplars are needed and of which anatomical region.
   b. No exemplars located: the determination that exemplars were not located after searching the various available databases throughout California to obtain exemplars of the appropriate anatomical region.
      i. The report and notes indicate exemplars were not located and which anatomical region would be needed for comparison.

5. Not compared: the documentation that the latent print and exemplar prints were not compared.
   a. Not compared same surface (NCSS): analysts may choose not to compare latent prints (excluding ABIS value prints) to the exemplar prints of a subject already identified to the same surface.
   b. Not compared ABIS hit: analysts may choose not to compare additional latent prints (excluding ABIS value prints) to subjects (excluding victims or any individuals listed for comparison) that resulted from an ABIS hit.
   c. The following are exceptions:
      i. Victims (and subjects requested for elimination) will be compared to all prints of value.
      ii. All ABIS value prints will be compared to all applicable subjects regardless of the location from where the prints were developed.
      iii. All latent prints in homicide cases will be compared to all applicable subjects.
iv. Special requests from the client, the District Attorney's office, and/or the court asking that all prints in the case be compared. This may be subject to approval from the Supervisor or Manager.

D. **Verification**

1. The verification phase is an independent application of the ACE process utilized by a subsequent examiner to either support or refute the conclusions of the original examiner. Refer to [LP.23](#) for verification procedures.

2. A conclusion of identification or exclusion will be verified.

3. A conclusion of inconclusive may be verified at the discretion of the Analyst, Technical Lead, or Supervisor.
   a. Inconclusive decisions with weight leaning towards an identification or exclusion, and reported as such, **will be verified.**

V. **Documentation**

A. The ACE-V process will be documented on the LIMS generated Quality Log. (See [LP.24](#))

B. The case analyst and verifier must have documentation to show the ACE process.

C. **GYRO** (described below) will be used to document the Analysis phase prior to the comparison phase for all latent prints that will be compared by the case analyst.

   1. This includes prints that will be compared to listed individuals and prints that hit to individuals in ABIS.

   2. Print or save the analysis documentation prior to adding more documentation during the comparison phase.

   3. GYRO analysis documents must be included in the test record.

D. Comparison/Evaluation documentation (mark-ups) will be completed by the case analyst for every latent print identified, and included in the test record.

E. **The Verifier** will document their ACE (analysis/comparison/evaluation) using GYRO at a minimum of one mark-up per individual identified.

   1. The verifier may document their ACE for subsequent identifications to the same individual on a GYRO worksheet or in the space provided "Verifier Observations" on the quality log.

F. **The Verifier** will document their ACE process for exclusions.

   1. Documentation may be on the quality log in the space provided "Verifier Observations" or as a GYRO worksheet.

G. Additional forms of documentation are optional.

H. **GYRO** documentation of analysis:

   a. The GYRO documentation system is an efficient and effective method for examiners to document the analysis and comparison stages of the ACE-V process. GYRO uses a color-coding system to convey the analyst's degree of confidence in the existence of a feature and the degree of variation to which that feature may appear in a corresponding exemplar print.
b. The primary benefit of GYRO is not just to communicate which features have been selected during the Analysis phase, but also to document the analyst’s level of certainty regarding the existence of the feature and the amount of weight the analyst will assign to the feature during the Comparison phase. It also documents the level of expectation that the feature will be present in an exemplar if the exemplar and latent print were produced by the same area of friction ridge skin, as well as the tolerance that has been assigned for that feature.

c. In GYRO, the “G” stands for \text{GREEN}; the “Y” stands for \text{YELLOW}; the “R” stands for \text{RED}; and the “O” stands for \text{ORANGE}.

i. A feature marked with \text{Green} represents high confidence in the existence of that feature in the latent print. A green feature will then accordingly be given more weight during the Comparison phase and the analyst will have high expectations to find the green feature in the exemplar print.

ii. A feature marked with \text{Yellow} represents medium confidence in the existence of that feature in the latent print. A yellow feature accordingly will have medium weight during the Comparison phase, and the analyst will assign a medium level of tolerance to that feature.

iii. A feature marked with \text{Red} represents a great deal of uncertainty regarding the feature and it’s existence in the latent print. Accordingly, a red feature will have high tolerance for how it may appear in the exemplar print. Red features should be given minimal weight during the Comparison phase because of the significant uncertainty the analyst possessed regarding the presence of the feature.

iv. A feature marked with \text{Orange} is used to represent features that were not observed initially in the Analysis phase, but rather were observed in the Comparison phase, while using the exemplar print to “see” the features in the latent print. Accordingly, orange features should be used cautiously and be minimally relied on to reach an identification decision. Orange features must not represent the majority color in a GYRO comparison documentation scheme.

v. Additional colors may be added to the color key of a mark-up documenting other features, such as 3rd level detail (creases, incipient ridges etc.) or areas of distortion.

VI. Consultation: A significant interaction between examiners regarding one or more impressions in question.

A. Consultations are a natural and positive part of the scientific process and should be supported.

B. Consultations may occur at any stage of the examination (analysis, comparison, evaluation, or verification), both before and/or after decisions are made.

C. Consultations may result in the recognition of differences in opinion between analysts, creating conflicts that require conflict resolution.

D. Conflict resolutions must be documented. Any documentation generated by other analysts will be retained within the case record.
1. See [LP.23](#) for Conflict Resolution during the Verification stage.

2. Conflict Resolution regarding suitability determinations will require the following actions:
   a. The unit supervisor will be informed of the conflict and will assign a 3rd party analyst to document their analysis of the print(s) in question (using "GYRO" or other documentation). The 3rd party analyst will not be informed of any prior opinions regarding the analysis of the prints(s) in conflict until after their analysis documentation has been completed.
   b. Upon completion of their analysis, the 3rd party analyst will discuss their opinion(s) with the original two analysts to determine if there is agreement. The consensus decision will determine the suitability for the print(s) in question.
   c. Depending on the results of the consensus decision, the case may be reassigned.

E. Consultations must be documented and the check box selected in LIMS within the Latent Result field (result data extension box).

F. Consultations can not occur on competency tests.

G. **Significant and Non-Significant Interactions**

1. *Non-Significant* Interactions are discussions falling below the level of a significant interaction that typically do not require documentation as those meeting the consultation standard. These typically have less potential to impact the key decision stages of ACE and are often related to case efficiency, strategy for workflow, or case management. Examples include, but are not limited to:
   a. Preliminary observations of suitability
   b. Searching efficiency “search smart clues”
   c. Processing choices
   d. Anatomical origin
   e. Orientation
   f. Determination of "lifter prints"

2. *Significant* Interaction examples include, but are not limited to:
   a. Presence of significant distortions impacting the analysis or comparison, outside of preliminary suitability determination
   b. Presence of specific features during the analysis or comparison

3. Flexibility:
   a. There may be situations where a discussion rises to the threshold of a consultation because it has a significant impact on the case.
   b. If there is doubt whether a discussion has risen to the level of a consultation, it should be treated as a consultation.
4. Documentation of a Consultation
   a. The purpose of documenting a consultation is to record information or guidance obtained as a result of the consultation.
   b. Discussions or other communications that do not reach the level of a consultation do not need to be documented.
   c. The documentation for a consultation must include the following:
      i. Specific friction ridge impression(s) reviewed or discussed
      ii. The nature and result of the consultation
      iii. Date and initials or signature of the examiners involved
      iv. Depending on the nature and extent of the consultation, the consultant examiner may satisfy the above minimum documentation requirements by including the information within the notes of the initial analyst. It is also possible in more extensive consultations that a separate set of notes, annotations, or images etc. be generated by the consultant examiner. These must be included in the case record.
   v. Consultants should not subsequently be used as verifiers.

H. References

1. SWGFAST Document #10, Standards for Examining Friction Ridge Impressions and the Resulting Conclusions (Latent/Tenprint) Ver. 2.0, 2013

END OF DOCUMENT
I. Policy: Latent print evidence submitted to the Laboratory will be examined to determine if there is sufficient friction ridge detail present for a comparison or an ABIS search.

A. General Information

1. A pre-screening of latent evidence is a preliminary observation of the friction ridge detail present which determines if the case has potential for further examination.

2. A full-screening of latent evidence is a complete inventory of the usable friction ridge detail present, prior to the ACE-V process. This may include the potential quality assignment and anatomical region of the print.

3. Analysts will follow the evidence handling and inventory procedures as described in LP.09.

4. Analysts will utilize the criteria outlined in LP.19, to determine the level of suitability of the friction ridge detail (if present) on the latent print cards or photos etc.

5. Upon first opening the evidence packaging, analysts will date and initial in the designated area. If the container is not a Latent Envelope, the date and initials should be written on the container in a location easily identified (for example, near the barcode).

6. The pre-screening process is not considered sampling.

7. To avoid mishandling of evidence, there should not be multiple unsealed or unclipped envelopes open at a time in the work areas.

B. While pre-screening is not required, the following will apply to cases that are pre-screened:

1. Cases that DO meet the following criteria during pre-screening will be retained at the Laboratory pending further examination:

   a. Examination requests with subjects listed for comparison must have at least one latent print meeting the criteria for Comparison Value (exclusionary or identification), or ABIS value.

      i. Once a print of value has been located, the pre-screening analyst may attempt to locate and obtain the required exemplars to conduct this
examination. For more information on the exemplar databases, see LP.27.

b. Examination requests with no subjects listed for comparison must have at least one latent print meeting the criteria for ABIS value. See LP.19 for more information about ABIS value.

c. Should a request be canceled by the agency following a pre-screening only, a report must be generated.

C. Procedure for cases pending further examination going into the backlog after pre-screening

1. The pre-screening analyst will mark the latent print of value in permanent red ink (or in Photoshop for digital prints) with the letter or number, as itemized by LIMS, in the correct anatomical orientation (if known), near the print. Marking the print indicates that it meets the minimum standard for ABIS and/or Comparison value. Though there may be more than one latent print of ABIS or Comparison value, only one will be marked during pre-screening.

2. All of the latent lifts or photos will be marked according to the evidence handling procedures in LP.09 and itemized in LIMS. See FSD.38 for more information on itemizing in LIMS.

3. The analyst will return the evidence to an evidence storage location at the completion of the pre-screening phase. The request form may be attached to the evidence (if stored together), or filed in a separate location.

4. The following documentation will be made in LIMS for each case that was pre-screened:

   a. Under the Request Tab, highlight and right click on the corresponding request to the case that was pre-screened and select Edit Findings

   b. Under the General Analytical Module, highlight and right click on the corresponding evidence that was pre-screened and select Add Result

   c. Change the Result Type selection to Latent Result

   d. In the Large Notes Area, enter the date and initials of the analyst who performed the pre-screening, along with a note of what work was performed (opened, itemized, pre-screened, etc.).

   e. Select Apply to save and close the documentation

D. Cases that DO NOT meet the following criteria will be completed after the pre-screening phase. These cases will typically shift from a pre-screening into a full-screening of the evidence.

1. The following are circumstances in which the evidence will be returned to the agency and a report will be issued reflecting the results of the submitted latent evidence:

   a. Examination requests with subjects listed for comparison and:

      i. The friction ridge detail does not meet the criteria for either Comparison or ABIS value OR

      ii. Exemplars were not located for the listed individuals and there are no prints meeting the criteria for ABIS value. All prints suitable for
Comparison (in scenarios with no exemplars to compare) will be marked following the alphabetic or numeric itemization by LIMS, and itemized in LIMS.

b. Examination requests with no subjects listed for comparison (or no DOB provided for subjects listed), and the friction ridge detail does not meet the criteria for ABIS value. All prints suitable for Comparison (in scenarios with no exemplars to compare) will be marked following the alphabetic or numeric itemization by LIMS, and itemized in LIMS.

2. The case will be assigned and completed in LIMS. See LP.14 and LP.16 for further instructions on examination records and entering results into LIMS.

END OF DOCUMENT
I. Policy: Verification is the independent application of the ACE process, as used by a subsequent qualified examiner, to either support or refute the decision rendered by the original examiner. The verification process is the "V" portion of the ACE-V methodology used by the latent unit.

A. Interpretation decisions reached by an analyst of Identification and Exclusion will be verified by at least one qualified examiner, authorized to perform verifications.

1. An inconclusive decision is verified at the discretion of the analyst, Unit Supervisor or Technical Lead.

B. Blind verification may be used on casework at the discretion of the analyst, Unit Supervisor or Technical Lead.

II. Procedures

A. Requesting Verification

1. The evidence, quality log, and exemplars used are securely transferred in LIMS, with a secure PIN, to a Fingerprint Holding File, or directly to a qualified examiner. The LIMS entry must occur contemporaneously with the physical transfer of evidence.

2. The evidence will be securely clipped to the necessary documents to protect the evidence from loss, contamination, or deleterious change.

B. Verifier Responsibilities

1. The verifying analyst will perform the following duties:

   a. In LIMS, transfer evidence and attached documentation to their possession.

   b. Verify case(s) in a timely manner.

   c. Initial and date all agreed upon results listed on the quality log. The date indicated on the quality log represents the date the verification was performed.

   d. Initial and date all exemplars used during the examination. The date(s) indicated on the exemplar(s) represents the date(s) the exemplar(s) was used to perform the verification.

   e. Documentation of ACE must be generated by the verifier for identification and exclusion decisions. Verifier documentation will be
returned to the original analyst to be included in the test record. All original observations must be retained.

i. See LP.19 for information on required documentation from the verifier.

f. If the verifier requires better exemplars, or exemplars from a different area of friction ridge skin, the verifier may locate suitable additional exemplars. If additional exemplars are not able to be located, the verifier will notify the case analyst, and the agency will be notified that additional exemplars are needed. All additional exemplars used for testing must be included in the test record.

g. Ensure all latent prints adhere to the suitability standards of quality defined in LP.19. Print Quality: ABIS, Identification, Exclusion, and No Value.

h. Upon completion of the verification, promptly transfer the evidence and documentation to an appropriate Holding File, or Analyst in LIMS. The physical transport of the case will occur contemporaneously with the electronic transfer in LIMS.

i. If the verifier observes non-conforming work beyond QAC-3, or a pattern of QAC-3 non-conformities, the verifier must bring it to the attention of the Unit Supervisor or Technical Lead. See LP.62 for more information on the levels of non-conforming work.

j. If the verifier does not agree with the interpretation decision(s) documented by the case analyst, the verifier will provide feedback that must be tracked. All evaluation decision disagreements from the verifier will be documented on the designated "verifier observations" area of the quality log.

i. If the case analyst agrees with the verifier, the case analyst will document the changes that were made on the designated "changes made after verification" area of the quality log.

ii. If the case analyst does not agree with the verifier, and there is no resolution through consultation, the two analysts will enter into conflict resolution (below).

C. Conflict Resolution: Verification

1. Conflict Resolution during verification is a process that takes place when the verifier does not agree with the result(s) determined by the case analyst, and there is no resolution through consultation.

   a. Interactions that take place between analysts, during the verification process, regarding the result(s) of a comparison, are considered significant, and will be documented in the test record. Refer to LP.19 for information on documenting consultations.

      i. Corrections needed for QAC-3 non-conformities are not considered significant.

2. The Unit Supervisor must be informed of the conflict resolution, and will assign a third analyst to examine the print(s) in conflict. The third analyst will not be informed of any prior examination decisions (written or verbal) until
after all three analysts have documented their findings. The Unit Supervisor will provide the necessary exemplars and evidence in conflict to the third analyst for examination.

3. **Assigned Third Analyst duties:**
   a. Document their ACE on GYRO mark-up worksheet(s).
   b. Discuss their decision(s) with the original and verifying analysts to determine if there is agreement. The reported result will be the consensus decision.
      i. If it is determined the comparison in question could have reliably rendered more than one result, the unit will report the **most conservative opinion**.
   c. If the original analyst does not agree with the final result, the case may be reassigned, but all documentation will be retained in the test record.
   d. Depending on the nature of the disagreement, the Laboratory may decide to have analysts outside of the FSD examine the print or case in question.
   e. **Original documentation of consultation and conflict resolution will be retained in the test record.**
   f. The Unit Supervisor will be advised of the outcome.

### III. Criteria to be a Verifier

A. For an analyst to be authorized to conduct verifications, certain goals must be met to the satisfaction of the Unit Supervisor and/or Technical Lead. The following outline these requirements:

1. The analyst must have conducted comparison casework of varying levels of difficulty (including complex comparisons) for **at least one year**.
2. The analyst must complete a **minimum of 20 "supervised" verifications** to the satisfaction of the Unit Supervisor and/or Technical Lead.
   a. The "supervised" verifications must include both Identifications and Exclusions.
   b. Feedback will be provided to the analyst by the Unit Supervisor and/or Technical Lead.

B. Once the above requirements are met, and the analyst has demonstrated competence in the Verification Process, Authorization will be granted.

### IV. Reference

A. SWGFAST Document #8 - *Standard for the documentation of ACE-V (Latent) Ver. 2.0, 2012.*

B. SWGFAST Document #10 *Standards for Examining Friction Ridge Impressions and Resulting Conclusions Ver. 2.0, 2013.*
I. POLICY: Analysts will use a LIMS generated Latent Quality Log to document friction ridge examination using ACE-V on all comparisons. Documentation of ACE will be made on the Quality Log at or near the time of the examination and prior to verification. Additional forms, such as GYRO analysis, or side-by-side comparison mark-ups, may be used as supporting documentation but will not replace a Quality Log for documenting the ACE-V process. The Quality Log will be retained as part of the case record.

II. Procedure

A. When a case is ready to be verified, the Quality Log is printed from LIMS by using Crystal Reports and selecting LAP QA LOG within the Report Category Latent Fingerprint Unit. The Quality Log will automatically populate from findings entered in LIMS. See LP.14 for procedures on entering ACE documentation into LIMS.

B. The Quality Log will document:
   1. all prints and persons compared.
   2. the lack of suitability of the exemplar, including area of friction ridge skin needed, when applicable.
   3. the need for exemplars when not located, including area of friction ridge skin needed, when applicable.
   4. the name, initials, and date(s) of examination of the verifier(s).
   5. the Screening Value of each print.

C. Analysis Documentation

1. Latent prints used for a comparison will be analyzed according to criteria stated in LP.19. The analysis documentation will populate an area on the Quality Log that corresponds with the item number for the latent print being analyzed. Analysis documentation will be completed prior to comparison.

2. Although all comparison examinations require documentation, the extent of the documentation is dictated by the complexity of the examination and the quality and quantity of information present in the latent print. At a minimum
the following will be documented on the Latent Quality Log when a comparison is made:

a. Anatomical source (fingerprint/palm print/foot print).

b. Description of level 1 (pattern type or region of palm) and quality of print.

3. The Quality Log may contain further Analysis documentation, or may reference further documentation detailed on a GYRO/Mark-Up sheet, which may include, but is not limited to:

a. Substrate information

b. Preservation method (Lift Card, Digital Image)

c. Development medium (Powder, CAE+Dye Stain)

d. Distortions present (including possible interpretations for variations in appearance)

e. Matrix (apparent blood, wet)

f. Deposition pressure (heavy, light)

g. Movement (lateral, rotational, drag marks)

h. Presence of any Level 3 detail (ridge path, pores, incipient ridges, creases)

D. Comparison Documentation

1. A legible copy of the known exemplar prints used for comparison will be retained in the case record.

2. At a minimum, a unique identifier of the exemplar, such as the name, will be documented on the Latent Quality Log.

3. With the exception of Law Enforcement personnel, the DOB and any known Record Identification Number will also be present on the Quality Log for compared latent prints.

4. Notes or observations generated during the comparison phase will be retained in the test record.

E. Evaluation Documentation

1. The comparison conclusions for each latent print to individual(s) will be documented on the Latent Quality Log. The analyst will also document the date(s) in which the comparisons were made.

2. Identifications will be documented as follows:

a. Anatomical source of the identification (Right Thumb). This will populate on the log from LIMS when entered in the Compared Individuals field.

b. The comparison result for an identification will appear as "MID" or "ABIS hit".

c. The number of corresponding minutiae or other detail will be noted.
d. Whether or not any dissimilarities were observed may be noted.

3. Exclusions will be documented as follows:
   a. The reason for the exclusion (differences of minutiae and/or differences of pattern).
   b. This comparison result will appear as "Exclusion" on the Quality Log.

4. For Insufficient Exemplars and Exemplars Needed, the area of friction ridge skin lacking or missing will be noted, and the comparison results will appear as "INS" or "NRL" on the Quality Log.

5. Inconclusive results will appear as "Inconclusive" on the Quality Log. An explanation for inconclusive result is in the report; however, specific details about the inconclusive decision must be on the Quality log (comparison notes), including the reason for the decision and specifically to which fingers or palms.

F. Verification Documentation

1. When applicable, the verifier(s) will document agreement with the case analyst by initialing and dating next to the evaluation results on the Latent Quality Log. The verifier will also sign their name in the Verified By field at the top of the log.

2. If the verifier(s) does not agree with the evaluation documentation, or is requesting more information or consultation with the analyst, a date and initial is not needed, and the log will not be signed until there is agreement.
   a. The Verifier will document disagreement of interpretation results in the "Verifier observation" area of the Quality Log.
   b. The case analyst will document corrections made as a result of the verification in the "Changes made after verification" area of the Quality Log.

3. For more information on Verification procedures, see LP.23.

G. The ACE-V process should be considered circular rather than linear. If during any phase of ACE-V, additional or new information becomes clear which would change a previous step, supplemental notes will be added and dated. However, original observations will not be discarded.

III. Reference

A. SWGFAST, Document #8: Standard for the Documentation of Analysis, Comparison, Evaluation, and Verification (ACE-V)(Latent), 9/11/12 ver 2.0

END OF DOCUMENT
I. Policy: Exemplars are needed for latent comparison examinations, and are obtained from law enforcement agencies, in compliance with CORI (Criminal Offender Record Information) regulations.

A. Fingerprint and palm print exemplars used in examinations may routinely be obtained from the Contra Costa County Sheriff's Records and Identification Unit, Cogent Automated Fingerprint Identification System (CAFIS) WebArchive, California Department of Justice (DOJ), and the Federal Bureau of Investigation (FBI). On occasion, exemplars may also be obtained from other Local, State, or Federal Agencies.

B. Foundation: Analysts in the Latent Print Unit are not custodians of any exemplar records.

1. The custodians of the CAFIS WebArchive exemplar records, and the exemplar reference samples in the CAFIS, are the staff in the Record and Identification Unit of the Contra Costa County Sheriff's Office and staff of the Alameda County Sheriff's Office.

2. The custodians of the DOJ Automated Archive exemplar records are the staff in the California Department of Justice's Fingerprint Unit.

3. The custodians of the FBI exemplar records, and the exemplar reference samples, are the staff in the Federal Bureau of Investigation's Fingerprint Unit.

4. Priority will always be given to the most suitable exemplar over location (county) from which the exemplar originated. However, an attempt to locate a sufficient record should start with exemplars from Contra Costa County agencies. If the exemplars from Contra Costa County are not suitable, the analyst may attempt to find a suitable exemplar from another agency within the state of California. In some circumstances it may be necessary to obtain a suitable exemplar from another state, if available.

C. California Department of Justice: CLETS Search

1. To obtain the DOJ record number, open the MSS Web Workstation or the Automated Archive System using the Internet Explorer web browser and Log in with User ID and Password.

2. MSS Web Workstation:
a. From the CLETS main page, in drop down selection by MASKS, select "RAPS-Criminal History" and select the GO button.

b. A Criminal History Inquiry screen will open, and the following mandatory information will need to be entered to obtain the DOJ record number:
   i. **Route Data**: employee number and laboratory number associated with name being searched.
   ii. **Alpha Name Inquiry (QHA)**: Last, First of name being searched.
   iii. **Sex**: "M" for male, "F" for female, "X" for unknown.
   iv. **DOB**: Year, month, and day of birth (yyyymmdd); if exact date of birth is unknown, the age may be entered instead.
   v. When the FBI number or social security number is known, it can be entered here as well to search for the DOJ record number.
   vi. Once the mandatory fields are completed, select the SEND MSG button.
   vii. To retrieve the DOJ record number of the individual, select the NEXT MSG button.
   viii. Locate the DOJ record number next to the individual listed with a corresponding name and DOB to that of the Criminal History Inquiry search.
   ix. Records with **DSP** after them do not have fingerprint records on file.

3. **Automated Archive System**:
   a. Enter **Name** and **DOB** in the field "Name and DOB" and select Query Archive.
   b. A reason for the search (For example, Lab or employee number) must also be entered.
   c. If a record exists matching the Name and DOB searched, a box will open with the DOJ record information for the individual.
   d. If a record does not exist, "No Hit on Name/Date of Birth" will be indicated.

D. **California Department of Justice Automated Archive: Exemplars from DOJ**

1. Exemplars are printed using the Automated Archive System.

2. The Query Archive screen will open, fill in the following fields:
   a. **SID**: enter the DOJ record number obtained from the CLETS search (see above).
   b. **Reason**: enter the Laboratory number or other reason for the search and select Query Archive.
   c. **Choose Document Type** window will open, select Document Type: All or NIST Fingerprint Record.
   d. Select the Document List button and choose desired record(s) to print.
3. Prints not available in the Automated Archive System must be obtained by emailing the California Department of Justice.
   a. Send the request to the following email address: email.prints@doj.ca.gov
   b. The following wording for the request is recommended by DOJ (followed by your name and contact information):
      i. Please email fingerprints/palm prints for CII: (enter the number). A police department requested the subject be compared in a latent print examination as part of an ongoing active criminal investigation.
   c. A response should be received within 48 hours.

4. Exemplars may also be obtained by contacting the California Department of Justice Expedite desk: (916) 227-3307 or (916) 227-3244.

E. Cogent Web Archive System: Exemplars from CAFIS
   1. Open the Contra Costa Web Archive Program.
   2. Enter the User Id and Password (case sensitive).
   3. Select Search Archive.
   4. Fill in the Last Name, First Name and DOB (optional) fields and select Search.
   5. Search Archive Query Results - listing will appear if there are records on file.
   6. Click on the corresponding record to the subject being searched, which will become highlighted once selected.
   7. Select Details.
   8. The record will download and a NistViewer Screen will open.
   9. Fingerprint Records:
      a. Select the Tree View icon, then Fingerprint Image Data.
      b. To print a fingerprint record, select the printer icon.
      c. A notification will appear reminding the analyst to print to a certified printer, select OK.
      d. A Print Options Dialog box will open.
      e. Select Tenprint on Paper, then OK.
      f. A Print box will open, select the correct printer, then print.
   10. Palm Print Records:
      a. Select the Tree View icon, then Palm Print Image.
      b. To print a palm print record, select the printer icon.
      c. A notification will appear reminding the analyst to print to a certified printer, select OK.
      d. A Print Options Dialog box will open.
e. Select *Palm on Paper*, then **OK**.
f. A **Print** box will open, select the correct printer, then **print**.

F. **Federal Bureau of Investigation: Exemplars from FBI**

1. Exemplars can be requested by email through a LEO account.
2. Exemplars can also be obtained through the IRQ in ULW. **See procedures below.**
   
a. Open Transaction Manager
   
i. Select *Create Image Request* (IRQ) button.
   
ii. A new box will open.
   
   1. Fill in the **Subject Identifier** with the FBI Number.
   
   2. Select a drop down option for **Finger Number:** 00 - Unknown or 20 Unknown Palm.
   
   3. Select a drop down for **Image Type:** 1 - Fingerprint (event) or 3 - Palm Print.
   
   4. If there is a specific record being requested, enter the BSI number from the search in the BSI section, or leave section blank if unknown.
   
   iii. Select *Create IRQ and Submit*.
   
   b. Open up **Inbound/Outbound**
   
i. Select *Send*. A new box will open to upload file; click *Browse* to locate the Image Request file; select *Open*, then **OK**.

   ii. A new box will appear indicating the request was received: select **Close**.

   iii. The request will appear as EXEC in the Job Queue until the search is completed.

   1. To refresh the screen press F5, then RETRY in the box that appears.

   iv. A Green Box next to the search indicates the job is complete and ready to be reviewed.

   v. Click the Green Box next to the **IRR** search and select **Save**.

   c. Go back to Transaction Manager
   
i. Select the IRQ search.

   ii. Click *Manually Add Response to Case* button (under Case Preview tab).

   iii. Browse to find the Image Request Response for that case (may be in Downloaded files), and select **Open**.

   iv. Select the **IRR Preview** tab, and then **View Ten-Print Image**.

   v. A new window will open displaying the Ten-Print Image, select **Print**.
I. Policy: Unidentified latent prints meeting the minimum ABIS value standard are searched against the Local Cogent Automated Fingerprint Identification System (CAFIS Version 6.2) and any other applicable ABIS databases to attempt to establish the source of the prints.

A. General Information

1. Automated Biometric Identification System (ABIS) databases are used to attempt to establish the source of a latent print in casework (fingerprints or palm prints).

2. See LP.19 for minimum standards for search eligibility.

3. Latent Unit reports must include the scope of the database searches (Local, DOJ, FBI).
   a. The frequency, time frame, and potential deletion of enrolled prints will also be addressed in the reports. (See Compliance Statements LP.16).

4. Latent prints are searched through the following databases: Local (Contra Costa County and Alameda County regional database) and Federal Bureau of Investigation (FBI).
   a. The Next Generation Identification (NGI) database of the FBI is searched after there was no identification made by first searching the Local CAFIS database.
   b. The California Department of Justice (DOJ) database is not routinely searched, but may be searched after there was no identification made by first searching the Local CAFIS database.

5. Software for the ABIS databases are installed onto the computers of all staff in the Latent Unit.
   a. The individual ABIS workstations are not uniquely identified. If CAFIS (Local ABIS), DOJ (CA state ABIS), or NGI (FBI ABIS) are unavailable, all unit terminals will not have access.

6. All analytical conclusions made in casework are formed by a latent print analyst not an ABIS database.

7. Any case with a single usable print which hits in ABIS, and is subsequently identified, may be verified by more than one qualified analyst.

8. The top 15 candidates will be compared prior to determining a "Hit" or "No-Hit."
   a. If possible, when the same individual appears in the top 15 candidates more than once, more records will be reviewed until 15 different candidates have been compared.
      i. More 6-packs or side-by-side printouts will be needed to document the 15 different candidates.

9. Unidentified prints on Comparison Competency or Proficiency tests will not be searched in ABIS regardless of their quality.

10. The dates of all database searches must be captured in the technical record, including the name or initials of the analyst(s) performing the searches.

11. A screen shot displaying the minutiae selected for each print searched will be included in the technical record.
B. Authorization

1. The databases are restricted to personnel authorized by the Supervisor of the Latent Print Unit. See FSD.41.

2. ABIS users have different levels of access, authority, and responsibility depending on their assigned position.
   a. The Supervisor of the Latent Print Unit will coordinate with staff from Contra Costa County Sheriff's Technical Services to assign the appropriate user security level to each analyst (CAFIS user).
   b. Analysts in the Latent Unit have the ability to:
      i. search latent prints
      ii. view, edit, and delete (as necessary) enrolled latent print records
      iii. retrieve search results from latent print and ten print-latent print (T/LI)/palm print-latent print (P/LI) inquiries.
      iv. access WebArchive. (LP.27)
   c. Analysts in the Latent Unit do not have the ability to upload, alter, or delete exemplar samples.
   d. Staff from Contra Costa County Sheriff's Technical Services work with Cogent and the Department of Justice to maintain, install, and upgrade the ABIS.
      i. Software version upgrades are verified prior to use in casework. (LP.69)

3. A firewall within the CAFIS prevents the users in Alameda County from viewing, altering, or deleting the Contra Costa County latent print records within CAFIS.

C. Quality Assurance

1. To ensure CAFIS is working properly and continues to conform with specified requirements, a control print known to be enrolled in the databases will be searched quarterly on any one of the terminals utilizing an ABIS for casework. A positive control result occurs when the correct finger or palm from the expected source appears as one of the top fifteen candidates. The print will be searched and documented in accordance with current policies and procedures.

2. Major upgrades to Cogent software will require a performance verification.

3. For negative control results, when the known print does not appear as expected, the following steps will be taken:
   a. An additional search will be done.
   b. If the known candidate still does not appear as expected, the Supervisor and all analysts (CAFIS users) will be notified, the ABIS terminals will be taken offline and labeled "out of service," and a service call will be made to the appropriate Help Desk or Cogent representative.

4. Details of any damage, malfunction, modification to, or repair of ABIS software (including all databases being searched by the unit) will be documented on the ABIS Maintenance/Performance Check Log (LPF.07) located in the ABIS Maintenance Binder and electronically on the Sheriff's Network, in the Latent Folder.
   a. All technical interactions with a Cogent representative or Biometric Specialist will be documented on the log.

5. See LP.18 for further information on maintenance documentation and performance checks.

6. Technical Review of an ABIS search includes:
   a. a review of all screen-shots that contain minutiae and other markings used to launch a print through CAFIS.
      i. the technical reviewer will concur that the information selected by the analyst would result in a successful search.
ii. as deemed necessary, the technical reviewer may request for another search to be completed, using additional or different markings.

b. a review of any 6-pack (no-hit) printouts.

D. **CAFIS Procedures: Local Search**

1. **Optimal screen resolution/display settings for Cogent applications are 1680 x 1050 and Smaller.**

2. **Entering the latent print into CAFIS**
   a. From the home screen, select **Scan**.
      i. Select **Scan** if using the Epson Scanner to enter the latent.
      ii. Select **File Import** if importing an image from a file, such as from a DVD.
         1. **Note:** the image will have to be saved as a JPEG for importation into CAFIS.
         2. If the image needs to be re-sized, from the drop down box **Resize to 100%**, select the **Resize by Ruler** option. Select a starting and ending distance on the ruler of the image and the system will change the image to the equivalent size. If this size is correct, select **apply**. If it is not correct, reset the distance until the system reads the image size properly.
   b. A red crop box will appear on the image. Press and hold down the left mouse button to move the box over the latent print to be searched. Press and hold down the mouse wheel to rotate the box to ensure proper orientation (the thick red line should be at the bottom of the latent print). Select **Clip and Save**.
   c. A **Clip and Save** dialog box will open. Adjustments to brightness and contrast may be made on this screen, as well as selecting **LT** for a fingerprint and **PL** for a palm print. Select **Save**.
   d. The Demographic Entry Dialog box - Latent Document Information screen will open. **The following fields must be completed:**
      i. **Case No.:** The Laboratory number including the request number.
      ii. **Latent Card ID:** The item number - lift card number and alpha (for example: 1-1-A is entered as 1011).
      iii. **Memo:** The agency case number and abbreviated agency name, (for example: CCCSO 19-1234).
      iv. **Misc. No.:** miscellaneous information (optional as needed).
      v. **Crime Date:** The date the latent print was lifted or photographed; or the offense date.
      vi. **Crime Code:** The offense code.
   e. Select **Save/Clear** or **Save/Reuse** when completed.
      i. Save/Reuse allows this information to be saved and applied to a subsequent latent search.
   f. Select **Return**.

3. **Editing the latent print for search (Best Practices)**
   a. Double click on the transaction in the queue, or highlight the transaction and select **Latent Processing**.
   b. Edit the minutiae selection by adding or deleting minutiae, clearing the minutiae, or select **Reprocess**.
      i. **Follow the ridges** and mark as many true events (ridge endings and bifurcations) as are present on the latent up to about 30, when present.
      ii. Cogent trainers recommend looking for clusters or groups of minutiae to mark, preferably away from low specificity areas of the print.
iii. When possible, avoid crossing over large areas of the print (two marked minutiae with several intervening ridges not marked), as this may be misinterpreted as an open field.

iv. Avoid plotting detail in tightly curved areas, such as the core, as this may be read as "false minutiae" due to the known prints in the database not containing these features.

v. For more pointers on best searching practices, refer to the Latent Training Manual.

c. Latent fingerprints that have less than 20 to 30 minutiae plotted, may also have the core circled, **if one is present and if there is also a delta present**. Marking both the core and the deltas is particularly important for **whorl patterns**. For examples of when to mark cores and deltas, refer to the training manual.

i. To set the core, select the "Add and move a core" button and angle the tail to slant with the ridge flow.

ii. To set the delta(s), select the "Add and move a delta" button and adjust the circle to include the delta location. Select the left and right deltas for whorl patterns.

d. Not required, but the ridge flow **may** be edited as follows:

i. Select the "Edit ridge flow" button and shift the red lines until they are in concert with the flow of the ridges.

e. The pattern **may** be entered on the local search.

i. FBI searches will require pattern or finger position selections to lower the file penetration.

f. Once the latent has been correctly marked for search, select **Save and Return**.

g. Select **Yes** when the Latent Processing box opens asking "**Are you finished editing the record?**"

4. **Searching the latent print**

a. Select **Search**.

b. A Latent Search Parameter box will open. Ensure all appropriate finger(s) or palm region(s) to be searched are checked and select **Continue**.

c. All local searches should be at a priority 9. If a rush case requires an expedited priority, authorization from the Supervisor, Forensic Manager, or designee is needed to change the priority setting at the local level.

5. **Viewing the search candidates**

a. When the search is complete, the queue will display the search transaction as **TP Hit/Wait 4 Verify (for fingerprints)**, or **Wait: PP/Verify (for palm prints)**. From the Verification Screen select **Candidates**.

b. The candidates may be viewed on either the **Single pair view** screen, or the **Six pack view** screen. More than fifteen candidates may appear, but staff must review the top **fifteen candidates** for potential identifications and exclusions.

c. If the latent is a palm print, the candidate box should be moved **as necessary** to allow for the correct anatomical region to be displayed and compared as a possible source.

6. **ABIS Hit**

a. A "Hit," or potential identification decision, is reached when an analyst observes a sufficient amount of agreement, without unexplained differences, between the search print and the known print candidate.

i. ABIS hits are preliminary observations that lead to full ACE-V examinations. See **LP.19** for further information on the ACE-V method and process.

b. If a potential identification is made at the local level, there is no need to search the latent print in any other database.
c. If it is determined there is a hit, the analyst will still review the remaining top 15 candidates.

d. Hits must be marked as Confirm Yes.

e. To close out of the candidate view screen and complete the transaction, select End Trans.

f. A printout of the Single Pair View screen, showing the latent print next to the candidate from the potential hit, including pertinent queue information (for example: lab#, item#, record#), must be included in the technical record.

g. A screen shot displaying the minutiae selected for each search (excluding a relaunch for ULF enrollment) must be included in the technical record.

h. ABIS searches resulting in Identifications are meant to be investigative leads. If as a result of an ABIS search, a subject other than the victim is identified, staff may choose to compare the subject to only the ABIS value prints. All other prints are not required to be compared unless instructed to do so.

i. Exception: In homicide cases, all prints will be compared.

7. ABIS No hit

a. A "No-Hit" decision is reached when an analyst observes a sufficient amount of features in disagreement between the search print and the known print candidate. Other reasons for an analyst to determine a "No-hit" may include:

i. the known print is lacking adequate quality in the specific area of friction ridge skin present and clear in the latent print.

ii. the latent print contains an undetermined feature from smudging, background noise, or other distortion causing the latent to appear to have disagreement to the known print candidate.

b. If it is determined that the latent print did not hit to any of the top 15 candidates, mark Confirm No to the first candidate, then select End Trans. It is not necessary to indicate Confirm No to every candidate.

c. Printouts of the Six Pack View screens showing the latent print and the top fifteen candidates must be included in the technical record. Also included on the printouts will be the laboratory number, latent print identification number or item#, and any other pertinent queue information.

d. A screen shot of the first search and second search is necessary if the print was searched locally twice.

e. Searches that do not result in an identification must be enrolled in the local and FBI Unsolved Latent Database/Unsolved Latent File (ULD/ULF).

f. Unidentified prints searched through local CAFIS will subsequently be searched in the FBI's NGI (DOJ as required) database(s) using the Latent Gateway or ULW (see procedures below).

8. No hit enrollment:

a. Local database: To enroll a print into the ULD, select Insert into DB. Select Return to complete the transaction and return to the main queue.

b. FBI database: To enroll a print into the ULD, relaunch the remote search to the FBI, In the box that opens, select "YES" for the drop down "Unsolved Latent File" - this will enroll the print once the search is completed.

c. For information on checking future subsequent results in the unsolved latent database, both CAFIS and NGI, as well as information on issuing ABIS Notifications, see LP.30.

9. As a quality assurance measure, prints that do not hit, are recommended to be searched again following the best practice examples listed above with slight differences from the original search. For example:

a. Do not add the core and delta

b. Try adjusting the ridge flow
c. Select a different cluster of minutiae to plot

d. Generally speaking, prints with about 30 minutiae marked will not require additional searches unless a large print has an additional area available to search. For example a large latent palm print.

e. To re-launch the print through the local database, select **Duplicate Transaction** and the analyst will edit then launch the print to search.

f. Upon completion of the second search, the analyst will print out a screen shot of the latent with plotted minutiae to maintain in the technical record.

   i. For a No-hit on the second search, the screen shot along with "No hit" indicated by the analyst will be the only required documentation.

   ii. For a Hit on the second search, a split screen ("single pair view") screen shot will be required showing the hit.

---

E. **Latent Gateway to search DOJ and FBI Databases**

1. Export From CAFIS

   a. Complete the local search in CAFIS.

      i. **Note:** The fingerprint pattern and palm or finger position may be selected prior to or after the initial CAFIS search.

   b. Open the transaction to be searched against the DOJ or FBI database.

   c. In the split screen window, select **Transaction** followed by **Remote Search**.

   d. A box will open asking to relaunch search. **Select OK.**

   e. A window will appear, select the appropriate remote database (DOJ or FBI) to be searched. Select Latent Friction Ridge Features Search (**LFFS**) as the **Type of Transaction**. **Select OK.**

      i. An LFFS search is performed using the features that have been manually extracted from the selected image by the operator.

      ii. Latent Friction Ridge Image Search (**LFIS**) is the other available **Type of Transaction** which is performed using automatically extracted features from the selected image. **This method is not used by the Latent Unit.**

   f. An LFFS Entry Dialog window will open and the fields will be completed as follows:

      i. **CASE INFORMATION:** Lab #, latent item#, agency and agency case#

      ii. **LATENT INFO:** Pattern and Latent Position

         1. Use this field to lower the penetration value of the search.

         2. **Note:** It is highly recommended that the penetration percentage be lowered to at least 50% prior to launching an FBI search.

            i. Palm searches will still indicate "100%" penetration; however, adding the search area (for example: left entire palm or left upper palm) will lower the search penetration.

      iii. **NAME ABBR FIELD VALUE:** Attention Indicator: **analyst launching search.**

      iv. **SUBJECT DESCRIPTION:** not used.

   g. Select **Search** when completed.

      i. **Note:** If there is an error, ensure the "Case Identifier" or latent item number is present; it may need to be re-entered.

   h. Return to queue.

2. Check Search Results

   a. The phrase **TP Hit/Wait 4 Verify (for fingerprints) and Wait: PP Verify (for palm prints)** appears in the queue when the search is complete.
b. The comparison and documentation requirements are the same as for a local CAFIS search (see above).

c. If a transaction font turns Bold, or reads "Completed", this is an indication of an error or a non-candidate list return.
   i. Relaunch the search to attempt to get a valid result. Try to lower the penetration further (may require multiple searches).
   ii. If the same error occurs, a service call should be placed to the appropriate Help Desk or Cogent representative.
   iii. To determine the type of error:
      1. Highlight the transaction, right click to bring up the transaction menu, and select Show Error Message.

F. Deletion from the NGI (ULF) database
   a. To delete a latent record from the FBI, select Remote Database Review
   b. In the box that opens, select the following:
      i. Remote Database Name: FBI
      ii. Data Type: LT (finger) or PL (palm)
      iii. Database Operation Type: Delete a record from a remote database.
      iv. Note: TOT and ORI should already be populated.
      v. ATTN (Operator ID): user name
      vi. CIN Case Prefix: Transaction number
      vii. CIN Case Identifier: Laboratory number (for example 19-123-1)
      viii. CIX Case ID Extension: Print number (for example 1011)
      ix. UCN: FBI number generated when ULM is returned. This is now also referred to as SCNA and is a ten-digit numerical number.
      x. Note: This number can be located under "CSI ID"
   c. The queue will show the record as "deleting record" until the transaction is complete "Query completed."

G. IRQ (Image Retrieval Submission) - FBI Hit
   1. Take the following steps to retrieve exemplars from the NGI:
      a. Select Remote Database Review
      b. In the box that opens, select:
         i. Remote Database Name: FBI
         ii. Database Operation Type: QUERY a record from a remote database.
         iii. Type in the FBI#/UCN (Universal Control Number) into the provided field "FBI No."
         iv. Note: BSI refers to a particular record, should that be necessary to retrieve from the NGI, but is not required.
      c. The IRQ will return and appear in the Tenprints/Palm Prints queue.
      d. Right click on the highlighted IRQ and select open NIST package.
      e. Print the exemplar as well as the demographic information provided within the NIST package.
         i. Note: the exemplar will not have any demographic information on it.
H. Universal Latent Workstation (ULW) version 6.6.3 Inbound-Outbound Server for FBI Search (Finger and Palm latents)

1. ULW version 6.6.3 is a modular software suite containing the Transaction Manager, Latent Editor, and Comparison Tool, which together enable examiners to search latents through the NGI.

2. Latent prints must be scanned as a TIF in 8-bit greyscale, at 1000 dpi for search in ULW.

3. Digital images captured at 1200 dpi, will need to be scaled down to 1000 dpi for search into ULW. The following steps can be taken prior to ULW upload:
   a. Open the image in Photoshop and open a new blank page
   b. Change pixels to inches (make the image 8.5 X 11)
   c. Change dpi to 1000
   d. Color mode: RGB 8-bit and click OK
   e. Return to latent image and select all (Ctrl+A), then copy (Ctrl+C)
   f. Return to blank page and paste (Ctrl+V)
   g. Image is 1:1 and may now be adjusted as needed
   h. File then Save As (Uncheck the "Layers" box) and ensure image is .tif, then Save
   i. Image is now ready for upload into Transaction Manager for ULW search

4. In Latent Editor, select File then Program Settings, and be sure the following settings are selected added prior to use:

5. 
   a.
f.

Note: the "Colors" tab is for preferences only and has no impact on system operations

h.
6. A folder will need to be created for both latents ready to search "ULW Outbound", and for search results "ULW Inbound". Once completed, ensure that the folder(s) are entered and saved in the following settings:

   a. The "ULW Inbound" and "ULW Outbound" folder locations will need to be saved under the File Transactions Tab, within the Admin Tab, in the Transaction Manager (see below)

   b. The "ULW Outbound" folder will also be saved in the Latent Editor under File Locations. (See F.4.e above)

7. See the instruction manual for more set-up and system information, as well as any optional searching procedures not mentioned in this policy. (INSLP.16)

8. Launching a search through ULW
a. Open the Transaction Manager.
   i. The first time transaction manager is used an ADMIN User will need to be created. Thereafter, Log-in as ADMIN (no password needed). This will enable users to manage and delete searches once they're completed.

b. Under the Home tab, in the upper left corner, select Create Case.

c. In the new window that opens, select Import Image into New Case as Latent Feature Search (LFFS).

d. In the box that opens, the following information will need to be populated:
   i. Case Prefix: LAB #
   ii. Case ID: Latent # (eg., 1011)
   iii. Priority drop down: select 1 (high)
   iv. Select OK, then open the latent to be searched (location where latent was saved will automatically open if Latent Editor setup was done. See F.4.e above)

ey. A Case Preview box will appear in the lower left corner containing the latent to be searched.

f. Select Edit Search in ULW-LE from the menu of options under "Actions to Current Case" (to the right of the Case Preview box).
   i. The Latent Editor will automatically open with the latent present ready to be edited prior to launch.

g. In the Feature Markup tab, the following tasks can be completed:
   i. Under Image Tools, to use the Crop feature (optional), drag the red square to the area of the latent to be searched. The square can be adjusted as needed, then select OK in the dialog box that appears. A larger view of the latent will appear.
   ii. Prints may also be Inverted if necessary and Rotated as needed under Image Tools.
   iii. If the position (fingers and palms) and/or pattern class (fingers only) are known, enter that information under the Latent Info section.
      1. While fingers can be searched at 100% File Penetration, it is encouraged that it be brought down to 50% or lower whenever possible.
      2. Palms search at 100% File Penetration.
   iv. Under the Features section, it is recommended to leave the Feature Set at Quick Minutiae Search (the default setting).
   v. The Region of Interest (ROI) must be drawn for the search to function properly. To select the ROI, draw a polygon with the mouse around the best area of the latent, leaving out unwanted ridge detail, artifacts, etc. If the polygon appears acceptable, select Accept. Select Cancel to try again if necessary.
   vi. Select Find Minutiae and minutiae will appear marked automatically.
      1. Individual minutiae marked can be removed by left clicking on them, and the number of minutiae marked can be decreased/increased by sliding the Reject scale.
      2. Select Options, then Accept all Minutiae as Shown.

h. Select File then Save (NOT Save As), and close the Latent Editor.
   i. Return to the Transaction Manager, and the latent will now appear on the task list with a check under the Edited tab.

j. Ensuring the latent that was edited is still highlighted on the task list, select Submit Search from the menu "Actions to Current Case."

k. A box will open with the latent and it's information; select Save and Submit.
l. On the task list in the Transaction Manager, a check under the **Submitted** tab will appear.

m. Open the **NEC ULW Inbound/Outbound** portal using Internet Explorer.
   
i. Select **Continue to this website (not recommended)** when the certificate error appears.

n. Log in to the Latent Access Server
   
i. The Agency ID is CA0070000

o. Select **Send** then **Browse** in the window that opens. Find the latent ready to search by Lab number in the "ULW Outbound" folder that was created.

p. Select **Open**, then **OK** and a box will appear indicating the request was received.

q. The latent will appear as "EXEC" in the Job Queue until the search is completed.
   
i. To refresh the screen press F5, then **RETRY** in the box that appears.

r. A Green Box next to the search indicates the job is complete and ready to be reviewed.
   
i. A Red Box next to the search indicates there was an error, in which case the search should be launched again. If an error appears again, after ensuring all steps were done properly, the FBI system may be down.

s. Select the Green Box and **Save As** then save to the folder created "ULW Incoming".

q. Once saved, select **Open** and the ULW Comparison Tool will open with the candidates appearing on the right side of a split screen.

u. Select **File**, then **Open EBTS File** and locate the saved search print from the "ULW Outgoing" folder for comparison.

v. The result will need to be printed.
   
i. Prior to printing a Side by Side "Hit" screen, the eraser tool can be used to remove minutiae counts that block ridge detail.

   ii. To print a "No Hit" screen, select **Print Screen** on the keyboard and ensure all top 15 candidates appear on the list that is printed.

   1. Optional: the candidate list may be isolated for printing by using the rectangle cropping feature on the print screen.

   iii. Use the **SRL Preview** (lower left) tab in the Transaction Manager to view the candidate names, FBI#s, etc., and/or if needed for printing.

9. See above (Quality Assurance) for intermediate checks of the ULW software.

10. Major upgrades to ULW software will require a performance verification.

I. **Missing Candidate Image**

1. Sometimes during a FBI search, an error ("Query candidate failed! It may have been removed or sealed from database") may occur when a potential hit is to a flat (4 finger or 1 thumb) impression which has a cropping error and the image returns as "missing". In this scenario, the following steps will need to be taken in order to compare the exemplar print to the latent.
   
a. Select OK inside the error box.

   b. Click "Candidate" in the upper left corner and select "Query Candidate" from the drop down.

   c. A new screen will open with the candidate exemplars that are missing which can be used for comparison to the latent print.

   d. Click "Return" in the lower right corner and the split screen will appear again (after a quick automatic step back to the main transaction screen).

2. Should the error message occur on a local search, the above steps will not work because the record has been removed or sealed from the database.

J. **Documenting Searches:**
1. A record of all database search transactions must minimally be documented in the notes.

2. Opening the transaction search result to view the candidate list, constitutes work and must be reported.
   a. A search transaction deleted prior to viewing the candidate list is not considered work. This event should be rare and must be documented in the notes.

3. See LP.14 for instructions on entering results into LIMS.

4. See LP.27 for instructions on obtaining Exemplars.

END OF DOCUMENT
I. POLICY: Latent prints not identified after a search in the Automated Biometric Identification System (ABIS) are registered in the Unsolved Latent Database (ULD) and must be reviewed periodically for potential matches.

A. General Information

1. In the ULD, registered latent prints are continuously searched against the changing database.

2. The ABIS produces a queue containing potential matches for some of the registered latent prints.

3. See LP.28 for further information on ABIS.

B. CAFIS Procedure

1. To review the ULD queue, log into the Cogent system under the latent region and select the Tenprint/Palm print field located in the upper right-hand corner of the screen. The queue will display all ULD transactions with potential matches waiting for review. The transactions will appear as "Wait:LT/Verify" for fingerprints, or "Wait: PL/Verify" for palm prints.

2. Right click in the tool bar area to change the column selection appearance of the queue, or the appearance within the verification screen.

3. The size of the queue defaults to 10,000 transactions, but can be increased as needed to view all potential matches in the ULD. Take the following steps to increase the queue size when the transactions in the queue are greater than 10,000:
   a. Open the Configuration tool.
   b. Select "General" in the "Transaction Queue."
   c. Enter the desired queue size in the "Number of Transactions to Display" field and select Apply.

4. Determination of a potential Hit
   a. Double click on the transaction to open a side-by-side comparison screen.
   b. If the latent to tenprint/palm print is not a hit, select "Confirm NO," then select "End Trans" and return to the queue. This will complete the
transaction for that latent, removing it from the potential match queue, and no further work is necessary.

c. If the latent to tenprint/palm print appears to be a hit, print out the side-by-side latent and candidate images, and ensure that all pertinent latent and candidate information is captured on the printout. The case and candidate information is needed to open a subsequent request (ABIS Notification) for laboratory analysis. Select "Confirm Yes," then select "End Trans." This will remove the latent print from the queue.

i. It is the responsibility of the analyst issuing the ABIS Notification report to ensure the prints (latent and known) on the side-by-side printout are in fact a hit. The hit will also need to be verified.

ii. Once the latent print has been verified, delete the enrolled print from the ULD using the Database Query.

iii. The ABIS Notification will inform the requesting agency that further work can be done on a case. To complete the comparison of a hit, the evidence and a comparison request form will need to be submitted by the agency receiving the ABIS Notification report.

iv. Whenever possible, the new comparison request will be assigned to the original analyst, or the analyst who issued the ABIS Notification report.

v. For information on completing an ABIS Notification report, see LP.14.

C. Unsolved Latent Match (ULM)

1. The Tenprints/Palm Prints queue will accommodate the Unsolved Latent Match (ULM) transactions from remote database enrollments.

2. If the ULM transaction errors, the print may have been removed from the database. Otherwise the following may be attempted to retrieve the transaction for a comparison:

a. Highlight the ULM transaction in the Tenprints/Palm Prints queue.

b. Right click and select Side By Side View.

c. When the side by side view window appears, change the following settings on the right side, then click the Query button:

i. Data Source: Drop-down selection: Database

ii. Database Name: Drop-down selection: Criminal Database

iii. Record Type: Drop-down selection: LT/PL

iv. The query button opens the Query Criteria window. In the Case No. field, enter relevant case number and click OK.

v. The query will bring up all the enrolled transactions for the case number entered. If known, select the appropriate transaction, or Select All, and click OK.

vi. In the side by side view window, selected transactions will appear on the right in the split screen with the latent from the ULM on the left.
Move through the candidate transactions by using the **Next Pair/Previous Pair** buttons.

d. If the ULM transaction does not appear, the record was removed from the database and the transaction may be completed as a No-Hit.

3. If the ULM is a hit, follow the steps above for a hit and ABIS Notification. Refer to **LP.28** for procedures on deleting a record from the NGI.

4. To retrieve demographic information on a ULM hit, take the following steps:

a. Highlight and right click on the ULM transaction from the queue.

b. Select **View NIST packet**.

c. Select **Descriptive Text** and all case related and exemplar print information for a potential hit will be located under **Descriptive Data**.

d. **Print all necessary information before selecting "Confirm Yes" and "End Trans."**

END OF DOCUMENT
I. Processing Techniques

A. The following techniques have been approved and may be utilized in casework:
   1. Amido Black (LP.36)
   2. Cyanoacrylate Ester (LP.42)
   3. Dye Staining of Superglue-Fumed Latents (LP.39)
   4. Fingerprint Powders and Magnetic Powders (LP.33)
   5. Hungarian Red (LP.38)
   6. Ninhydrin (LP.40)
   7. Physical Developer (LP.41)
   8. RTX (LP.37)
   9. Wet Print (LP.35)
   10. WETWOP (LP.34)
   11. 1,2-Indanedione (LP.71)

B. Sequencing: While there is some analyst discretion as to choice of approved processing techniques to use, proper sequencing of multiple techniques must be followed. The following are some acceptable technique sequences:
   1. Porous Evidence:
      a. Ninhydrin followed by Physical Developer.
      b. 1,2-Indanedione followed by Ninhydrin.
   2. Non-Porous Evidence:
      a. Cyanoacrylate Ester followed by Dye Stain.
         i. This is the preferred and most sensitive technique available and should be used on most non-porous items.
         ii. This will be the selected sequence of techniques for a homicide case whenever feasible.
         iii. Fingerprint Powder can be applied after the Dye Stain.
      b. Cyanoacrylate Ester followed by Fingerprint Powder.
   3. Semi-Porous Evidence:
      a. Cyanoacrylate Ester followed by Fingerprint Powder, then a porous technique (e.g. Ninhydrin and/or Indanedione).
         i. Depending on the surface, magnetic powder is usually recommended.
         ii. Some semi-porous surfaces have too glossy of a finish to absorb a porous development technique. If the item does not appear like it's able to absorb a porous development technique, test a small area of the item with dye stain prior to using powder. Some apparent semi-porous (high gloss or plastic) substrates are better suited to be processed as non-porous.
   4. Blood Evidence:
      a. Cyanoacrylate fuming may be detrimental to Amido Black processing. The appropriate technique or sequence of techniques should be determined based on the case circumstances.
   5. Adhesive Evidence:
      a. Wetwop or Cyanoacrylate Fuming followed by Wetwop.
   6. RTX must be used prior to any other methods.

C. Flexibility

1. It is understood that various types of evidence may be submitted to the laboratory (i.e. porous, non-porous, adhesive, etc.) and the nature of the case or evidence and/or subsequent examinations may require use of a specific technique which does not
follow normal procedure. The best technique will be determined by the analyst; however, if it involves using the technique in a manner not validated or outside the scope of approved use for the technique the supervisor must be notified prior to processing to ensure the appropriate documentation is completed.

D. **Preservation**

1. Usable latent prints present prior to processing, or that develop on processed evidence will be preserved for examination. Latents will be preserved with digital images (LP.45), latent lifts, castings, or other forms of media. Photographed images taken for examination purposes must be taken with a camera and lens combination that passed the resolution test.

II. **Quality Assurance**

A. As a quality assurance measure, test strips will be photo-documented for all applied processing techniques and included in the test record. The photo does not need to be uploaded to Veripic.

1. If the control reaction is "weak" the following steps will be taken:
   a. **Check the expiration date.** If the reagent is close to expiring, make a new batch or use a new lot# and discard old reagent.
   b. **Check if reagent was newly made.** If the reagent is being used for the first time, check the reagent log and talk to the preparing analyst to ensure it was made correctly.
   c. **Check the environmental conditions.** Humidity or more time developing may need to be added for a better result.
   d. **Check the equipment.** Was the equipment properly maintained recently? Did the processing cycle run as expected?
   e. **Re-run the process/application using a new test strip.**

2. Below are examples of **good test strip reactions**:

   ![Image of good test strip reactions]

   a.

B. The purpose of a test strip (control) is:

1. to ensure equipment is working as expected.
2. to ensure prints can develop when following the selected sequence of processing for the evidence. When testing a sequence of techniques, the test strip will mimic the evidence.

C. All items of evidence will be reviewed by a competent examiner other than the case analyst to **confirm that ridge detail present has no value**. This may be accomplished by reviewing the evidence in person (peer review) or by reviewing digital images. See LP.14 for further information on reporting results.

1. Ridge detail categorized as having **no value**, is anything insufficient of or lesser than an **Exclusion Value** print.
2. Ridge detail determined to have **no value** must be digitally captured if the latent **could** be categorized by another competent examiner as having value or potential value for comparison. An example of **potential value** would be ridge detail with probable Level 1 (ridge flow) determination and no or very little (less than 3) discernible Level 2 features.

3. See LP.19 for the definition and description of an **Exclusion Value** print.

D. All control, chemical, lot#, and equipment information must be recorded in the test record.

E. Use caution when making decisions for processing that may have a negative effect on downstream evidence collection, particularly on potential DNA. For example:

1. Steps that require multiple solvents or washes.
2. High-intensity lasers or UV light pointed directly at the evidence for a period of time.
3. Excessive heat.

III. **Collection of Possible Biological and/or Trace Materials**

A. At the request of the agency, or when evidence preservation may be necessary, potential biological stains, touch DNA, and trace material will be collected prior to and/or following latent print processing.

1. Wear proper PPE (e.g. lab coat, gloves, and mask) to prevent possible contamination of the evidence. **Change gloves between handling different items of evidence.**
   a. For more information on cross-contamination prevention, see LP.64.

2. Moisten the swab(s) using sterile water without making contact with the swab. Use a QC’d sterile water ampule or other sterile water source.
   a. Record in the notes the lot number of the sterile-deionized water that was used.

3. Rub the swab(s) rigorously over the target area. Optimally, use the entire surface area of the swab to collect as much material for potential biological testing.

4. If necessary, for non-porous surfaces, use a dry swab to collect the residual moisture from the target area.

5. For stained areas, a substrate control may be collected. Repeat the above procedure on a visually **unstained** area.

6. A substrate control is not necessary when evidence collection is for contact DNA.

7. Package the swab in a properly labeled evidence envelope and allow it to dry completely.

8. Swabs from different items or locations must be packaged separately.

B. For typical firearm biological collection, collect three to four swabs from the following **three areas** and package separately:

1. Trigger and trigger guard

2. Sight areas, muzzle, slide

3. Grips
   a. At times using two swabs maybe necessary depending on how textured the grip is or how saturated and torn the swab becomes during collection.

4. Some modifications may be needed to the areas of collection depending on the firearm.

5. If collecting contact DNA swabs from unfired cartridges or fired cartridge cases, collect one wet and one dry swab from each group of cartridges or cartridge cases. If necessary, comparative evidence unit staff may be consulted to determine groups based on class characteristics. For large groups of cartridges or cartridge cases (over 10), multiple pairs of wet and dry swabs may be needed. Package the swabs from a single group together in one envelope.
I. Reagents must adhere to the applicable equipment requirements listed in Division Policy.

A. Reagents are stored in the Latent Unit at room temperature unless otherwise stated on the container, in the specific policy, or on the reagent log.
   1. Refrigerated or Frozen storage must be indicated on the container.
   2. Room temperature storage is in a darkened cabinet in the latent unit separated by flammable and non-flammable.

B. Appropriate NFPA or pictogram labels will be placed on all reagent containers.

C. All latent unit reagents are used in the laboratory.

II. Reagents prepared in the laboratory must include the following information on the container and corresponding reagent logs:

A. Identity of the reagent.

B. Individual who prepared the reagent.

C. Components used in making the reagent (Log only).

D. Reagent lot number (includes date of preparation).
   1. The designated lot number for reagents prepared by staff is: the date the reagent was prepared with the analyst's initials. For example, Lot# 010119KN.

E. When applicable, the container will also indicate the expiration date.

F. Reagents will be prepared in accordance with the approved reagent procedures published in PowerDMS.
   1. Once prepared, reagents will be tested prior to use with a positive and negative control.
   2. Reagent logs stored in the latent unit reagent binder are used to document the preparation and quality control information of stock and working solutions.

G. Deionized Water is obtained from the biology unit.
   1. The biology unit maintains the records for the filtration system.
2. The lot number for the water is the date the container was filled and the initials of the staff member who filled it.

III. Purchased pre-made reagents and kits

A. Containers will be marked with analyst initials and both: date of receipt and date opened.

B. Staff will use the lot number provided by the vendor for documentation in the test record unless otherwise indicated in the specific policy.

C. As needed, purchased reagents may be tested prior to use and must be tested following the intermediate checks described below.

IV. Quality Assurance and Maintenance

A. To ensure a reagent is working as expected, intermediate checks will consist of a positive and negative control run prior to, or concurrent with, all evidence processing casework.

1. The results of the reagent check will be documented in the test record.

2. Reagents that fail intermediate (control) checks will not be used on casework.

3. See individual reagent procedures for further information on failed reagent checks and troubleshooting.

4. Failed reagent testing must be brought to the attention of the Supervisor or Technical Lead.

V. Safety

A. The appropriate personal protective equipment will be worn when working with all chemicals.

B. Apply a "CAUTION: EVIDENCE CHEMICALLY TREATED, HANDLE WITH GLOVES" sticker or similar label on the outside of the evidence package for all processed items.

END OF DOCUMENT
## I. Introduction

A. Fingerprint powders for latent development are available in a variety of types and colors to provide contrast and friction ridge visualization depending on the substrate being examined.

B. Powders will adhere to most moisture or contaminants present on evidence, such as sweat or oils; irregularities on a surface, such as texture or scratches; and to superglue polymers deposited on an item.

C. Powders work well on non-porous and semi-porous surfaces, such as glossy magazine pages. However, powders have a tendency to fill in the background of coarser paper or cardboard.

## II. Quality Assurance

A. A test print is laid down on a non-porous or semi-porous surface (piece of plastic, foil, or similar surface to the item to be processed) and processed with a powder.

1. If the powder does not develop a visible test print then do the following:
   a. Re-apply the powder
   b. Re-hydrate the test print (iron or humidifier with deionized water)
   c. Use a different test print donor
   d. If the test print still does not develop, try another powder or choose another development technique, such as dye-stain.

2. If the evidence has been fumed, the superglue control print should be used to test the powder.

B. The test print (Control) result must be documented in the case notes.

C. Disposable brushes and powders are used whenever possible to avoid cross contamination.

   1. If powder is being used from a larger jar, pour the desired amount into a secondary container for use rather than dipping the brush directly into a large container.

D. All brushes, including Zephyr, Feather or Camel Hair should be discarded if soiled.
E. New brushes will be used on evidence if it is known that the evidence may later be tested for the presence of DNA.

F. Typically fingerprint powders do not have expiration dates; however, when small ball-like chunks begin to form, the powder should be discarded to avoid creating "fish-eye voids" during processing.

G. Brushes and powders are considered disposable. If not working properly, they are discarded and replaced.

III. Application

A. Brushes

1. Use one brush for each color of powder.
   
   a. Fiberglass brushes are typically used with regular fingerprint powders (for example, black, white, or bi-chromatic powders).
   
   b. Feather brushes are commonly used with fluorescent powders because of their finer texture. Fluorescent powder must be used very sparingly to avoid filling in the background of the item being processed.
   
   c. Magnetic wands/applicators are used with all magnetic powders.

B. Fingerprint Powders

1. Powder should be applied sparingly to the bottom of the brush fibers and any excess powder shaken off prior to dusting the evidence. The brush should then be lightly brushed over the area to be processed.

2. A visual examination with light at various angles will usually reveal any latent prints developed. An ALS (Alternate Light Source) or Laser must be used at the appropriate setting for the type of powder selected to visualize and photograph developed fluorescent prints.

3. A latent print that will only accept a light deposit of powder can be humidified and re-powdered to improve contrast.

C. Magnetic Powders

1. Place the end of the magnetic applicator into the magnetic powder and withdraw, shaking slightly to remove any excess powder. A ball of magnetic powder will have formed, making a "brusk-like" appearance at the base of the wand or applicator.

2. Gently move the ball of powder over the surface to be processed being careful not to let the head of the applicator touch the evidence surface, as this could scratch the latent print. Continue until the latent print has developed.

3. Over a disposable or secondary container, lift the rod in the center of the applicator to remove the excess powder from the wand.

4. Place the clean applicator over the area just processed to pick up any excess powder.

IV. Preservation of the developed Latent Print

A. Once a latent print is developed it must either be preserved by digital capture of the latent in place, or by lifting the latent with lifting tape; or both.
B. Latent print lifts:

1. Fingerprint tape will be carefully pressed over the latent print(s) to be lifted. If applicable, a directional arrow will be marked on an area of the tape with no latent prints. The tape is then slowly pulled off of the surface and placed onto the **glossy side** of a latent lift card of a color that will contrast with the color of the powder used.

2. Tape that tears easily when used or is known to have been in use for more than 3-4 years should be discarded and replaced.

3. The back of the latent lift card will be filled out with at least the following:
   a. Lab number.
      i. Agency case number (if known).
   b. A description from where the lift was collected and a sketch of the item.
      i. The sketch should also have an arrow matching the proper orientation of the directional arrow drawn on the fingerprint tape.
   c. LIMS Item number, if known.
   d. The analyst's initials or signature and date of collection.

C. Photographs of latent prints

1. Images of latent prints developed will be captured following the procedures described in **LP.45**.

V. Safety

A. Whenever possible, the application of powders should be performed in the fume hood with the sash lowered. If it is not possible to process items inside the fume hood, the NIOSH-approved particle mask may be worn, see **SAF.08 Respiratory Protection Plan**. Also a lab coat and gloves must be worn.

END OF DOCUMENT
I. Introduction
   A. Wetwop is a non-flammable pre-made liquid that is physically attracted to the oily components in latent print deposits.
   B. Wetwop is most commonly used on the adhesive side of tapes and on various types of gloves.
   C. Application is with a camel hair brush.
      1. The brush must be bleached prior to use on evidence known to be later examined for potential DNA.
   D. Cyanoacrylate Ester may be applied prior to Wetwop; however, it is not required.
      1. See LP.42 for more information on Superglue fuming.
   E. Wetwop is currently available in black and white. Color selection depends on the color of the evidence item. Select the color that would provide the most contrast for visualizing developed prints.

II. Procedure
   A. Agitate the Wetwop container prior to use.
   B. Pour a small working amount into a shallow container and apply the liquid onto the item using a camel hair brush.
   C. Allow the item to set for approximately 15 seconds, then rinse the excess Wetwop under running cool tap water.
   D. Lay the item in the fume hood (if possible) and allow to dry.
   E. After examining the processed item for latent prints, re-application of Wetwop may be done to darken any ridge detail.
      1. Photograph developed ridge detail prior to re-application of Wetwop.
   F. Latent prints developed in this manner must be photographed for preservation and further examination.

III. Quality Assurance
   A. Intermediate Checks
      1. All results from Wetwop reagent testing must be documented in the notes.
2. For the control, obtain a piece of non-evidence tape similar to the evidence and place a test print on the adhesive side.

3. If the evidence item is not tape, use a similar item as the control, if available. Otherwise use tape.

4. Proceed to develop the test print following the procedure above.

5. If the reagent is not reacting to the test print, re-apply the Wetwop or start over with a new test print (a new donor may also be required).

6. If the Wetwop is still not reacting to the test print on the second attempt, discard the bottle. A new bottle may be required regardless of expiration date, especially if the Wetwop appears to be drying out.
   a. The shelf-life for Wetwop is one year after the date the bottle was opened.

B. Wetwop and camel hair brushes are disposable. Both are discarded when not working properly.

IV. Safety

A. A lab coat, goggles and gloves should be worn while using this product.

B. Non-hazardous disposal.

C. Refer to SDS for more safety information.

END OF DOCUMENT
I. Introduction
   A. Wet Print is a liquid fingerprint powder solution that works well with wet or previously wet non-porous evidence items.
   B. Wet Print may work on evidence items that have been lightly washed.
   C. Wet Print may be used on items where mud, dirt, or heavy dust have covered the surface making ridge detail difficult to develop by conventional means.
   D. Wet Print is currently available in black and white. Color selection depends on the color of the evidence item. Select the color that would provide the most contrast for visualizing developed prints.

II. Safety
   A. A lab coat, protective eye wear, and gloves should be worn while using this product.
   B. If reagent gets sprayed into the eyes, immediately flush with large amounts of water for at least 15 minutes. If reagent gets sprayed onto skin, immediately wash with soap and water.
   C. Non-hazardous disposal.
   D. Refer to SDS for more safety information.

III. Quality Assurance
   A. Intermediate Checks
      1. All results from Wet Print reagent testing must be documented in the notes.
      2. For the control, place a test print on a strip of plastic or foil and dampen with tap water.
      3. Proceed to develop the test print following the procedure below.
      4. If the reagent is not reacting to the test print, re-apply the Wet Print solution or start over with a new test strip (a new donor may also be required).
      5. If the control print is still not developing as expected after the second attempt, discard the Wet Print reagent. A new kit may be required regardless of expiration date, especially if solution appears to be drying out.
         a. The expiration date for Wet Print should be located on the kit.
b. If the expiration date is not located, shelf-life is one year after the date the kit was opened.

IV. Procedure

A. Shake "Wet Print 1" container to disperse solids.
   1. Turn spray nozzle to OFF before shaking and after use to prevent leakage.

B. Adjust spray nozzle for a fine soft spray.

C. Spray "Wet Print 1" onto the item allowing the solution to roll down and spread over the evidence surface.

D. Repeat "Wet Print 1" spray 3 to 4 times or until ridge detail is completely developed, allowing about 30 seconds between each subsequent application.

E. Rinse as necessary with tap water using "Wet Print 2" sprayer from kit to clear off excess Wet Print solution.

F. If developed ridge detail appears to be clogged with residual Wet Print solution, spray a fine mist of tap water from the "Wet Print 2" container over the print.

G. Once prints are fully developed, photograph and let air dry.

H. Dried prints may then be re-photographed as needed and may also be lifted by conventional means.
   1. Be sure prints are dry before lifting.

END OF DOCUMENT
I. Introduction

A. Amido Black, also known as Naphthalene Blue-Black, Naphthol Blue Black or Naphthalene Black 12B, is a biological dye that stains the protein present in blood producing a dark blue color.

B. Amido Black should only be used to enhance apparent bloody ridge detail.

II. Precautions

A. Amido Black may be detrimental to biological examinations; therefore, blood samples for DNA analysis should be collected prior to latent processing. A consultation with staff from the Forensic Biology Unit is highly recommended prior to processing potentially bloody evidence.

B. Potentially usable ridge detail must always be photographed prior to application of Amido Black.

C. Apparent blood impressions should be dry before applying the Amido Black stain.

D. Use caution to not overdevelop ridge detail through reagent over-saturation. This can be particularly easy to do on porous items.

III. Incompatibilities

A. Amido Black should be used prior to other techniques.

B. Superglue fuming may be detrimental to the development of ridge detail with Amido Black.

C. Painted surfaces may be deteriorated by the methanol based developer and rinse solutions.

D. The water based method and the optional second rinse with distilled water in the methanol based method are not recommended for use on surfaces that may suffer from corrosion, such as firearms.

E. Amido Black may interfere with examinations for handwriting, inks, paper, and indented writing.

F. Amido Black may interfere with fiber, hair, paint, and other similar evidence types.

G. Use caution and watch development time closely when using Amido Black on heavily blood saturated evidence, as well as on porous items.
IV. Quality Assurance and Intermediate Checks

A. Amido Black will be tested with a blood standard control at the time the reagent is made and the results will be documented on the appropriate reagent log.

B. The reagent will be tested with a blood standard control and must obtain positive results just prior to use in casework. The control test results will be documented in the test record.

C. Control Procedure:
   1. A known blood sample will be obtained from the Biology Unit for use as a control and the records for the blood sample are maintained therein.
      a. Using the designated stamp, apply blood and create several blood standard strips for testing the reagent.
   2. Use the pre-made blood strip standards to test the reagent prior to use on evidence and record those results in the test record.
      a. The QC Lot number for the blood standards are maintained in the Latent Unit and will be documented in the test record.
      b. The Lot number should also be recorded on the bottom of the reagent log for reference.
   3. Apply the reagent to the swatch containing the known blood sample.
      a. If the known blood control turns a blue-black color it is a positive result. If the known blood does not turn a blue-black color it is a negative result.
      b. If a negative result is obtained, re-apply the Amido Black onto a new swatch. If negative results continue, the reagent must be discarded and a new solution must be made and tested.
      c. When a reagent fails the control test after reapplication, the Technical Lead or Supervisor must be notified.

D. Shelf Life (water-based and methanol-based):
   1. Literature indicates the shelf life for Amido Black is indefinite. However, for quality assurance purposes, the expiration date will be two years after preparation.

V. Water Based Formula with Fixer (Fischer 98)

A. Amido Black water-based formula is a one-step process that includes a blood fixer and a tap water rinse. The sensitivity and color intensity of the process are similar to that of the Amido Black methanol-based formula.

B. Reagent Preparation ([LPF.21 Amido Black Water Based Reagent Log](#))
   1. Developer Working Solution:
      a. The working solution is prepared on a stirring device by combining the following ingredients in the order in which they are listed and mixing for about 30 minutes.
         i. 500 ml Distilled water
ii. 20 grams 5-Sulfosalicylic acid

iii. 3 grams Naphthol blue black

iv. 3 grams Sodium Carbonate

v. 50 ml Formic acid (slowly pour)

vi. 50 ml Glacial Acetic acid

vii. 12.5 ml Kodak Photo Flo 200

b. Dilute the mixture to 1 Liter using distilled water. Although this mixture will be ready to use following dilution, allow the mixture to stand for several days prior to use for best results.

2. Rinse Solution: Rinse with tap water.

C. Application Procedure

1. Ensure all reagents are evenly distributed through the container prior to applying to the control stain and evidence by shaking the sealed bottle or by using a stirring device.

2. Spray/Squirt Bottle Method:

   a. Apply Amido Black by spraying or squirting the reagent to the surface in a uniform manner.

   b. Allow the Amido Black to stay on the surface for approximately 3-5 minutes or until blue-black ridge detail is visible.

   c. Rinse.

3. Tray Immersion:

   a. Immerse the item in the developer working solution for 30-60 seconds.

   b. Remove from solution and rinse, or immerse the item in a tray of rinse solution for one minute.

   c. Allow the item to air dry.

4. If the Amido Black ridge detail is too light, repeat the steps above and rinse as needed.

5. Allow the surface to dry prior to visualization and photography.

VI. Methanol based formula

A. Reagent Preparation: The methanol based method is prepared by combining the ingredients for each solution on a stirring device (LPF.20 Amido Black Methanol Base Reagent Log).

1. Developer Working Solution:

   a. The working solution is prepared on a stirring device by combining the following ingredients in the order in which they are listed and mixing for about 30 minutes.

   i. 1 gram Naphthol blue black (Amido Black)
ii. 50 ml Glacial Acetic acid  
iii. 450 ml Methanol  

2. Glacial Acetic Acid-Methanol Rinse Solution  
a. Combine ingredients and mix with a stirring device.  
i. 100 ml Glacial Acetic acid  
ii. 900 ml Methanol  

3. Glacial Acetic Acid-Distilled Water Rinse Solution (optional)  
a. Combine ingredients and mix with a stirring device.  
i. 50 ml Glacial Acetic Acid  
ii. 950 ml Distilled Water  

B. Application Procedure: Same as above.  

VII. Ridge Detail Visualization  
A. Detail is visualized by a chemical/stain reaction.  
B. Development is complete when the maximum contrast of the blue development color is achieved.  
C. Preserve developed ridge detail with photography.  

VIII. Safety  
A. Biological hazards are biological substances that pose a threat to human health. Use extreme caution when working with and being exposed to biological evidence.  
1. All biological evidence must be treated as if it is hazardous.  
2. Proper protective equipment must be worn to protect the employee, including gloves, a lab coat and protective eye wear. A particle mask should be worn when the evidence has flaking blood, or when collecting samples for DNA testing.  
3. Bench tops and shared work surfaces are routinely cleaned with a bleach and water solution before and after the examination of blood contaminated evidence and use of known blood controls.  
4. Butcher paper is placed on the bench top work area prior to use to capture potential shed biological material. The paper is disposed of after use, into the trash or biohazard container, depending on the amount of soiling.  

B. Chemicals may posses health and/or physical hazards.  
1. A fume hood or full face respirator is required to prepare and apply the working solution (and rinse for the methanol based application). SAF.08  
2. Proper protective equipment (gloves, lab coat, eye wear) should be worn when using Amido Black. Use of proper safety precautions when handling and disposing of chemicals is expected. See SAF.06, SAF.08 & SAF.10.
3. The methanol-based formula is highly flammable, and can damage some surfaces. Therefore, it is suggested that the water-based formula be used whenever possible.

C. Apply a "Caution: Evidence Chemically Treated, Handle with Gloves" sticker on the outside of the evidence package after processing.

IX. Reference Materials

A. Chesapeake Bay Division of the International Association for Identification website http://cbdiai.org/Reagents/main.html

I. Introduction

A. Ruthenium Tetroxide (RTX) solution is a latent print processing technique that can be used on a variety of substrates. RTX works on both porous and non-porous objects, with the exception of some dark or black items due to poor developed print visibility.

B. The RTX fumes react with organic compounds, particularly fatty oils or fats contained in sebaceous contaminants found in latent print residues.

C. The developed latent print is brownish-black in color and can be darkened if necessary by more exposure to the product.

D. RTX developer can be applied in different ways; however, the fuming method with the provided air pump is recommended by the manufacturer, as is directly applying the liquid to porous and semi-porous items.

E. For sequencing purposes, RTX should be applied to an item before any other latent print processing techniques, such as Powders, Ninhydrin, and Cyanoacrylate Ester. Most other processing techniques may interfere with the effectiveness of the RTX developer and RTX does not interfere with the effectiveness of other reagents.

   1. If sequencing will be done on a case, first conduct a test using a similar substrate prior to starting the latent processing sequence.

F. The developer is a solution of Ruthenium Tetroxide (RuO$_4$) and an organic solvent and appears as a yellow/transparent liquid.

II. Quality Assurance

A. Intermediate Checks

   1. All results from RTX reagent testing must be documented.

   2. For the control, obtain a piece of plastic, foil, paper, or similar item to the evidence and create a test print.

   3. Proceed to develop the control following the procedure below.

   4. If the reagent is not reacting to the test print, re-apply the RTX or start over with a new test print (a new donor may also be required).

   5. If the RTX is still not reacting to the test print on the second attempt, a new bottle of reagent will likely be required.
6. RTX does not have a definite shelf-life. Black precipitates may form on the bottom of the reagent bottle; however, its effectiveness should not vary as long as the solution remains a transparent yellow in appearance.

III. Safety

A. RTX must be used in a fume hood with adequate ventilation.

B. Proper protective equipment must be worn. Including safety goggles, chemical resistant gloves, and a lab coat.

C. If skin contact is made, wash thoroughly with soap and water. Staining may be removed with alcohol or diluted bleach (sodium hypochlorite).
   1. Clorox brand bleach is 5.25% sodium hypochlorite and should be diluted down to 3% for contact with the skin.

D. Never spray the developer out directly toward the human face.

E. RTX is not poisonous or toxic to humans, but the fumes can irritate the eyes and respiratory tract.

F. RTX developer solvent is not known to be hazardous to the environment, nor is it flammable.

G. Non-hazardous disposal.

H. Refer to SDS for more safety information.

IV. Procedure

A. Fuming Method
   1. The fuming device may be used for blowing fumes out of the developer by making bubbles in the solution with an air pump or compressor. The pump is composed of a glass cylinder which has a cap and an air blow nozzle with a pipe for fumes to exit. The air pump is battery operated and may be used with RTX to fume both porous and non-porous objects.

B. Liquid/Dipping Method
   1. Dip items, such as paper or tape, directly into the RTX solution which may be poured into a glass or ceramic tray. The reaction time should be immediate and prints would become visible after exposure to RTX (approximately 5 seconds). If the developed prints do not appear dark enough, a second dip into the solution is recommended.

C. Collection of developed ridge detail is done by photography.

END OF DOCUMENT
I. Introduction
A. Hungarian Red is used to recover nearly invisible ridge detail left in blood deposits.
B. Hungarian Red is supplied in ready-to-use premixed quantities, typically in a sprayer bottle. However, the procedure requires the application of a blood fixative solution (below) prior to applying the reagent.
C. Hungarian Red may be used on most porous and non-porous surfaces.
D. Visible ridge detail should be photographed prior to the application of this product.
   1. If the ridge detail has potential to be usable, it must be photographed prior to using Hungarian Red.

II. Quality Assurance
A. Precautions
   1. Hungarian Red can be detrimental to subsequent forensic examinations.
      a. The process of using a blood fixative and Hungarian Red will likely interfere with the potential for DNA analysis; therefore, blood or other physiological collection must occur prior to latent processing.
      b. Paper with ink handwriting may run with the use of Hungarian Red; therefore, evidence should be photographed prior to latent processing.
B. Intermediate Checks
   1. Hungarian Red will be tested with a control (test strip) and must obtain positive results prior to use in casework. All control testing results will be documented in the test record.
   2. Control Procedure:
      a. A known blood sample is obtained from the Biology Unit and records for the blood sample are maintained therein.
      b. The lot number for the blood swatch is retained in the Latent Unit and will be documented in the test record.
      c. Follow the procedures below for application onto the control (test strip).
d. A positive control reaction occurs when the blood swatch turns a red color and fluoresces when using the Coherent TracER Laser or the ALS (at 515-560nm). The control test strip fails if the blood swatch does not react.

e. If a negative result is obtained, re-apply the Hungarian Red. If the reagent fails the control test after reapplication, notify the Technical Lead or Supervisor. The reagent will likely need to be discarded.

III. Procedure

A. Hungarian Red solution is supplied in a ready to use container. However, a sulfosalicylic acid solution used prior to the Hungarian Red is prepared at the laboratory.

B. Sulfosalicylic Acid Solution (LPF.18 Sulfosalicylic Acid Log)
   1. Mix in a fume hood using a magnetic stirrer:
      a. Weigh 20-23 grams of 2% sulfosalicylic crystals and mix into one liter of distilled water.

C. Apply the sulfosalicylic acid solution to the evidence: spray directly or moisten tissue paper or paper towel and keep over the surface for a minimum of three minutes to fix the blood.

D. Spray Hungarian Red onto the item from a distance of about six to nine inches.

E. Allow one minute for the dye to set and then wash lightly with distilled water.

F. Remove any remaining water droplets with compressed air.

G. Developed ridge detail may be photographed and lifted using a "gel-lifter" (below).
   1. The surface must be completely dry before attempting to lift developed prints.
   2. Ridge detail that has potential to be usable must be photographed prior to attempting to lift because the print will migrate into the gelatin causing a loss of detail.

H. Lifting technique
   1. Do not use normal lifting devices such as hinge lifters or fingerprint tape.
   2. The most effective lifting devices are gelatin-type lifters such as Sirchie "GELifters."

I. Forensic Light Source Examination
   1. Alternate Light Source (ALS): Use green light (515-560nm) to illuminate the surface with red or orange barrier filter for viewing and photography.
   2. Coherent TracER Laser: Use the adjustable laser light intensity with the provided orange barrier filter for optimal viewing and photography.

IV. Safety

A. A lab coat, safety goggles, and gloves should be worn while using this product.

C. Refer to SDS for more safety information.
I. Ridge detail, stabilized by superglue polymers, may be dye-stained for development, visualization, and collection.

A. Introduction

1. Attempting to dye-stain without superglue fuming first will generally wash ridge detail away.

2. Best practice is almost always to use a Dye-Stain rather than Powder on non-porous items following superglue fuming.

3. Care must be taken not to over superglue fume the evidence, as this will increase background staining. Fume exposure time, amount of superglue used, and temperature and volume of water (humidity) all have an effect on a latent being properly developed or over-developed. Refer to LP.42 for superglue procedures.

4. Acetonitrile, used in procedures below, will slightly soften polymerized ridge detail and allow the dye stain to penetrate more effectively.

5. Fluorescent dye-stains used at this lab are diluted to a degree that rinsing is not generally necessary. However, in some cases, rinsing may be needed to remove background noise and provide better contrast. Rinsing should be performed using the same ingredient used as a carrier in the dye stain formula (Methanol).

6. The following dye-stains are currently available:
   a. Rhodamine 6G
   b. Ardrox
   c. MBD
   d. RAM (mixture of Rhodamine 6g, Ardrox, and MBD)

B. Quality Assurance and Intermediate Checks

1. Fluorescent stains (working and stock) are tested on the date they are made and again with every use.
a. Test results when the reagent is first made will be documented on the corresponding reagent log.

b. Results of controls tested with every use will be documented in the case notes.

2. Obtain a superglue fumed test strip (control).

3. Apply the dye-stain over the visible superglued test print.

4. Allow the strip to dry and view the florescence under various wavelengths using the Alternate Light Source (ALS) or with adjustable laser intensity using the Coherent TracER Laser.

5. If the reagent test is negative (test print does not fluoresce), reapply the dye-stain or obtain a new superglue fumed print and apply (a new donor may be required). If the test fails again, a new batch of dye-stain must be made and tested.

6. Shelf-life and hazard information is located on each reagent log. Most stains expire after one year.

C. Application

1. Dye-stains may be applied by dipping, squirting, or by pipette and allowed to air dry prior to viewing.

2. Various wavelength combinations of the Polilight or various laser light intensities should be tried to obtain the best latent contrast with the surface being processed.

3. The wavelength at which fluorescence is optimal may be adjusted in accordance to the personal preference of the examiner for optimal visualization.

4. Developed ridge detail is photographed using the orange barrier filter (with applied forensic light source above 365nm).

D. Preparation and Procedure Rhodamine 6G

1. To make Rhodamine 6G Stock Solution (LPF.29 Rhodamine Stock Solution Reagent log), under fume hood:
   a. Weigh 0.1 grams Rhodamine 6G and place into a storage bottle
   b. Add 100 ml Methanol
   c. Use a magnetic stirrer until completely dissolved.

2. To make Rhodamine 6G Working Solution (LPF.28 Rhodamine Working Solution Reagent log), under fume hood:
   a. Pour 5 ml Rhodamine 6G stock solution into a storage bottle
   b. Add 5 ml Acetonitrile
   c. Add 90 ml methanol
   d. Cap and shake well before using.

3. Rhodamine 6G Procedure
a. Rhodamine 6G is a fluorescent stain that is applied to prints developed with cyanoacrylate ester.

b. For best visualization using the Polilight, view under range of 495-540nm with an orange or red barrier filter.

c. For best visualization using the Coherent TracER Laser, adjust the laser light intensity (1-8 watts) and use an orange barrier filter.

4. Incompatibilities: Items that inherently fluoresce in the 555nm range.

E. Preparation and Procedure Ardrox

1. To make Ardrox Working Solution (LPF.19 Ardrox Working Solution Reagent Log), under fume hood:
   a. Pour 1 ml Ardrox into a storage bottle
   b. Add 5 ml Acetonitrile
   c. Add 94 ml methanol
   d. Cap bottle and shake well before using

2. Ardrox Procedure
   a. Ardrox is a fluorescent stain that is applied to prints developed with cyanoacrylate ester.
   b. For best visualization using the Polilight, view under UV (clear UV-rated goggles are required for protection - no filter is required for photography) or view under range of 435-480nm using an orange or yellow barrier filter.
   c. For best visualization using the Coherent TracER Laser, adjust the laser light intensity (1-8 watts) and use an orange barrier filter.
   d. Note: If rinsing is desired, try using a tap water rinse and check for background reduction before applying a methanol rinse.

3. Incompatibilities: Items that inherently fluoresce in the 500nm range.

F. Preparation and Procedure MBD: 7-(p-Methoxybenzylamino) - 4-Nitrobenz-2-Oxa-1-3-Diazole

1. To make MBD Stock Solution (LPF.23 MBD Stock Solution Reagent Log), under fume hood:
   a. Pour 100 ml Acetone into a suitable beaker
   b. Add .1 gram of MBD
   c. Use a magnetic stirrer until completely dissolved.

2. To make MBD Working Solution (LPF.22 MBD Working Solution Reagent Log), under fume hood:
   a. Pour 5 ml MBD stock solution into a storage bottle
   b. Add 5 ml Acetonitrile
c. Add 90 ml methanol
d. Cap and shake well before using.

3. MBD Procedure
   a. MBD is a fluorescent stain that is applied to prints developed with cyanoacrylate ester.
   b. For best visualization using the Polilight, view under range of 415-505nm with an orange barrier filter, or 415-470nm using a yellow barrier filter.
   c. For best visualization using the Coherent TracER Laser, adjust the laser light intensity (1-8 watts) and use an orange barrier filter.

4. Incompatibilities: Items that inherently fluoresce in the 515nm range.

G. Preparation and Procedure RAM (a fluorescent dye stain blend of Rhodamine 6G, Ardrox and MBD)

1. To make RAM Working Solution (LPF.27 RAM Working Solution Reagent Log), under fume hood:
   a. Pour 30 ml Rhodamine 6G stock into the RAM storage container
   b. Add 2 ml Ardrox (Sirchie Stock Solution)
   c. Add 12 ml MBD Stock solution
   d. Add 8 ml Acetonitrile
   e. Add 948 ml methanol
   f. Cap and shake well before using

2. RAM Procedure
   a. RAM is a fluorescent stain that is applied to prints developed with cyanoacrylate ester.
   b. For best visualization using the Polilight, view under range of 415-485nm with an orange barrier filter.
      i. Note: Fluorescence of prints stained with RAM can occur throughout the range of Polilight settings. Select the setting and viewing filter that provides the best contrast between the ridge detail and the background.
   c. For best visualization using the Coherent TracER Laser, adjust the laser light intensity (1-8 watts) and use an orange barrier filter.

3. Incompatibilities: Items that inherently fluoresce in the 555nm range.

H. Safety

1. Wear the appropriate personal protective equipment:
   a. Rubber or nitrile gloves (latex gloves are not sufficient for methanol formulations)
b. Safety glasses or goggles
c. Laboratory Coat

END OF DOCUMENT
I. Using Hexane-based Ninhydrin to process porous items for latent prints

A. Introduction

1. Since it was introduced in 1954, Ninhydrin has been the most widely used chemical technique for processing porous evidence (e.g. papers, cardboard). Ninhydrin has been known to develop latent prints known to be over 30 years old.

2. Ninhydrin chemically reacts with amino acids to produce a dark purple product known as Ruhemann's Purple (RP). Amino acid components of latent prints are stable compounds that will attach themselves to the cellulose of a paper product. The amino acids will not migrate (as do fats and lipids - a concern in Iodine fuming) over a period of time or as long as the paper remains dry. Amino acids are water soluble, therefore, Ninhydrin would not be the proper technique if the porous evidence was wet or exposed to excessive moisture over a period of time, such as high humidity or fog. Physical Developer (LP.41) should be used for processing evidence that is or was wet.

B. Quality Assurance

1. A test strip will be used to ensure the Ninhydrin is properly reacting to amino acids by using an Amino Acid Reference Pad. See LP.31 for information on test strips and documentation requirements.

   a. If an Amino Acid Reference Pad is not available, donor prints may be used to test this reagent. Also, a donor print may be used in conjunction with the stamp and Amino Acid Reference Pad.

   b. The reference pads contain a mixture of L-amino acids in a concentration of 2%.

   c. The sticker on the bottom of the reference pad lists the work order number and the date of manufacture. The reference pads have a shelf life of 6 months from the opened date.

      a. If multiple pads are being used they should also be labeled numerically (1, 2, 3, etc.) with the initials of the analyst receiving the pads.

      b. The Lot Number for the reference pads is a combination of the work order, the pad being used, the analyst who opened the pad...
and the expiration date. **For example:** A pad with a work order # of 2842216 and an opened date of 10/21/14 would have a lot # of: **2842216-1 MC 4/21/15.**

d. Gloves will be worn while pressing a rubber stamp onto the amino acid portion of the reference pad. Press the rubber stamp onto a piece of paper 3-4 times sequentially creating a test strip. The test strip will then be processed with Ninhydrin following the application technique noted below.

   i. A positive reaction occurs when a pink/purple color develops in the pattern of the rubber stamp used.

   ii. A negative reaction occurs when a pink/purple color develops the background or no color change occurs in the area stamped with amino acid.

   iii. Refer to [LP.31](#) for examples of good test strip reactions.

   iv. Should a negative or weak reaction occur, run a second test strip using a different amino acid pad and test print. A new batch of Ninhydrin may also be needed. Refer to LP.31 for troubleshooting and notify the Supervisor or Technical Lead if the control does not improve.

C. **Application**

   1. Ninhydrin may be applied by dipping (for no more than 5 seconds), by brushing, by pipette, or by spraying (spraying should be a last resort for safety reasons). Application should be done in the fume hood and with proper safety protection (see Safety below). Evidence should be allowed to thoroughly air dry prior to storage.

      a. Apply Ninhydrin to evidence item.

      b. Allow item to dry.

      c. **The CARON heat and humidity chamber may be used if the evidence item will not be tested for DNA. The heat will affect potential DNA collection downstream. See [LP.55](#) for instructions.**

      d. A humidifier may be used to add humidity without heat. Place the humidifier (large or small) with the evidence into the (turned OFF) Caron chamber, Superglue chamber, or fume hood for optimal humidity.

      e. The processed item should be stored in a darkened area for continued development for at least 72 hours.

      f. If prints seem too faint, the steps listed above can be repeated.

      g. A clothes iron in the "steam" mode may also be used, but it affords little control over humidity levels and care must be taken to protect the evidence from the heat and accidental water leakage of the iron.

D. **Development Conditions**

   1. Subjecting most evidence to heat and/or humidity after applying Ninhydrin is highly recommended, particularly when the relative humidity levels are
naturally very low. The added heat or humidity can intensify the color reaction
and may shorten development time; however when practical, the evidence
should be left to continue development for at least 72 hours. If photos are
taken of developed prints prior to the 72 hour period, the same developed
prints do not have to be photographed again after the 72 hours. The CARON
chamber, which allows control of both heat and humidity is approved for use
with Ninhydrin treated evidence; refer to LP.55 for more information.

2. Although Ninhydrin may be applied in a lighted room, the development
should be allowed to occur in the dark, at room temperature over a 72 hour
period. Latent prints have been known to take several days to develop.

3. Ninhydrin developed latent prints may fade over a period of time and must be
photographed or scanned for preservation. Development should be monitored
to not over-develop and to ensure photographs are taken at an optimum point.
Secondary treatments with Ninhydrin has, on some occasions, enhanced a
weakly visible print.

4. Applying green excitation light from an alternate light source or using a green
filter may improve digital images.

E. Ninhydrin with Hexane

1. To make Stock Solution (LPF.25 Ninhydrin Stock Solution Reagent Log):
   a. Under Fume Hood:
      i. Add: 25 gm Ninhydrin crystals to 100 ml ethanol; using
         magnetic stirring,
         Add: 25 ml acetic acid, continue stirring until completely
         dissolved

2. To make Working Solution (LPF.24 Ninhydrin Working Solution Reagent
   Log):
   a. Under Fume Hood:
      i. Add: 30 ml Stock Solution (from above) to 1 liter of Hexanes.
         (Stir using magnetic stirrer until well blended and a clear light
         yellow solution is attained).
      ii. Caution: Use of rubber gloves is required due to the Hexanes
          while mixing the working solution.
      iii. Transfer to a working solution bottle and label appropriately.

3. NOTE:
   a. A dark yellow oily substance may appear at the bottom of the bottle
      that may cause inks to "feather" or blur. Use the working solution as
      needed until the oily substance is reached, then pour or pipette this
      substance out and discard it.
   b. The working solution may also be made using 30 ml of the stock
      solution from the Ninhydrin hexane formulation.
   c. Hexanes are flammable.
   d. Hexanes will not run most inks.
e. Hexane or n-Hexane must be used in this formulation and is the carrier approved for use at this lab.

F. Safety

1. A lab coat, eye protection and nitrile or thick rubber gloves should be used in addition to the fume hood. Lightweight latex and vinyl gloves are not adequate protection for the user. A full-face respirator must be worn if a fume hood is not available.

END OF DOCUMENT
I. Physical Developer (PD)

A. Introduction

1. Physical Developer is a silver-based liquid reagent which reacts with lipids, fats, oils and waxes present in fingerprint residue and is a productive means of developing latent prints on porous objects.

B. Procedure

1. Physical Developer has been found to work well on numerous porous items. In particular, PD can be used on wet or previously wet paper materials, on which other chemical processing techniques may not be used. Physical Developer has also worked well on items which have not been touched in years.

   a. Paper with an alkalinity factor above pH 7 is not suitable for processing with the PD solution. It will turn dark and the latent prints can be lost.

      i. Thermal paper is an example of unsuitable paper.

   b. Porous items are to be treated with Ninhydrin (LP.40) and/or 1,2-Indanedione (LP.71) prior to Physical Developer.

2. Any usable latent prints developed during processing should be photographed prior to further processing, as subsequent steps may obliterate prints that developed.

C. Quality Assurance

1. Ensure that the reagent being used has not expired.

   a. The PD kit contains three parts. The expiration of the solution is the date of the first expiring part, even if the other components have not yet reached their expiration date.

2. Use a gold chloride test strip (control) to run through all application steps listed below prior to use on casework. All results must be documented in the case notes.

3. If a negative reagent reaction occurs, run a new test strip through the baths again. If the reagent continues to fail, do not use on casework and notify the Supervisor or Technical Lead. New PD will likely be required.

D. Application

1. Do not poke or dent the paper items while they are submerged in Physical Developer. Handle items carefully even when wearing gloves. Dents made by
tweezers and glove marks may cause deposits of silver which may obliterate usable prints.

2. Additional baths of distilled or deionized water can be used between each step, if needed.

3. **Prior to each use, inspect the trays being used for the baths.** If there are excessive scratches or any cracks in the trays, new glassware or other trays will be needed.

4. The use of a slightly acidic pre-wash (Maleic Acid) is recommended to neutralize alkaline binder, fillers, and whiteners. The Maleic Acid pre-wash is prepared by stirring 25g of Maleic Acid into 1 liter of distilled water until dissolved.
   a. Pour the Maleic Acid pre-wash into a clean glass or plastic tray. Immerse the item being processed into the Maleic Acid pre-wash for at least 5-10 minutes or until no more bubbles rise from the paper item, whichever is LONGER.

5. Pour the Physical Developer working solution into a second clean glass or plastic tray.
   a. Drain the paper item momentarily of the Maleic Acid wash and move the paper item into the tray of Physical Developer solution.
   b. Gently rock the tray. A rotating rocking device may be used.
   c. Generally, latent prints begin to develop in approximately 5 minutes or less; however, do not process the item for longer than 15 minutes. Keep in mind that latent prints can be over-developed and background color may also develop which can obscure the fingerprints.
   d. During this phase the items should be continuously inspected as over processing cannot be reversed.

6. After processing the item, rinse in tap water.
   a. This can be done by placing another clean tray in a sink and allowing a continuous gentle flow of water to run into the tray.
   b. Rinse the item in the running tap water until excess stains are gone.
   c. PD prints may darken too much if the item is not thoroughly rinsed.
   d. The tap water should be clear as it exits the tray.

7. The item must be thoroughly dry before prints can be conclusively evaluated.
   a. If a thoroughly rinsed and dried item exhibits low contrast prints, the item may be reprocessed.
      i. Prior to re-processing, all usable prints that developed should be photographed.
      ii. Wash the item in distilled or deionized water to remove residual chlorine from the tap water.
      iii. Place the item in the PD working solution to attempt to further develop any weak prints.
      iv. Rinse and dry as above and reexamine the prints.
E. Preparation

1. Clean, scratch-free glassware must be used for Physical Developer solutions. Prior to each use the glassware should be washed with detergent and thoroughly rinsed with tap water, then re-rinsed with distilled or deionized water to remove any traces of chlorine from the tap water. If the glassware is dirty or scratched, silver may deposit in those areas and not on the evidence as it should.

2. Disposable plastic beakers may be substituted to reduce the possibility of contamination.

3. Metal forceps must not be used as they will react with the silver nitrate. Photographic tongs with rubber tips or plastic non-serrated forceps may be used.

4. The components of the Physical Developer kit should contain an expiration date on the packaging, and consist of the following:
   - Container A  Redox Solution  shelf life of 1 year
   - Container B  Detergent Solution  shelf life of 1 year
   - Container C  20% Silver Nitrate Solution  shelf life of 1 year

5. Do not mix Physical Developer Solution until ready to process the item(s), as the shelf life of the working solution is about 24 hours. Only mix enough quantity of working solution from the three bottles to complete the items currently being processed.

6. In order for the PD mixture to work properly, the following steps must be followed precisely:
   a. The Physical Developer solution is prepared by adding 10ml from Container B (Detergent Solution) to 85ml from Container A (Redox Solution).
   b. Solutions A and B are thoroughly mixed for approximately 2 minutes using a clean non-metallic instrument or sterile stirring apparatus.
   c. After mixing solutions A and B, add 5ml from Container C (Silver Nitrate) and stir for approximately 30 seconds.
   d. Pour the mixture into a clean glass tray and process as indicated above.

7. Document the Manufacturer and lot# for the Maleic Acid, Solution A, Solution B, and Solution C along with the results for the Control on the Physical Developer Working Solution Reagent Log LPF.26 and in the case notes.

8. Should larger volumes of working solution be required the mixing ratio is 17:2:1:
   a. Examples:
      i. Total Volume 100 ml = 85 ml Solution A, 10 ml Solution B, 5 ml Solution C
      ii. Total Volume 200 ml = 170 ml Solution A, 20 ml Solution B, 10 ml Solution C
      iii. Total Volume 500 ml = 425 ml Solution A, 50 ml Solution B, 25 ml Solution C

F. Safety
1. A laboratory coat, nonporous gloves, and protective eye wear should be worn when using PD.

2. If reagents are splashed or spilled, wash affected areas thoroughly under cold running water. If any reagent is splashed into the eyes, thoroughly wash eyes with cold running water. Seek medical attention if soreness or other symptoms persist. If the reagent is repeatedly splashed over the hands or if the hands are immersed in the solution without wearing nonporous gloves, some individuals may develop an allergic skin reaction to nondodecylamine and various detergents used in PD. This will occur most frequently with individuals who also exhibit skin reactions to household detergents.

3. Both the silver nitrate solution and the PD working solution are corrosive and toxic and will cause black staining on skin and clothing.

4. NOTE: Safety Data Sheets advise that contact lenses should not be worn when working with chemicals.

G. Storage

1. Sunlight and heat will degrade the chemicals; store in latent processing room chemical storage area.

2. Store reagent at room temperature.

H. Disposal

1. The PD and Maleic acid solutions must be disposed of as toxic waste. Place the used solution in a waste container and properly label it for hazardous waste pick-up.

I. References

END OF DOCUMENT
I. Cyanoacrylate Ester (CAE) is used to process non-porous or semi-porous items for latent prints

A. Introduction

1. In the late 1970's researchers in Japan and the United Kingdom discovered the latent fingerprint development capabilities of the fumes of the liquid adhesive superglue. Fully developed super glued or CAE developed prints are a white three-dimensional matrix, often visible to the unaided eye, and can be further enhanced with a variety of techniques. This development of latent prints is best explained as a three-stage process to produce polymer growth, enabling latent print visualization.

   a. Stage one occurs when fumes of CAE monomers are introduced to latent fingerprints and quickly bond with initiators in the residue.

   b. Stage two, the monomer on the fingerprint residue reacts with another CAE monomer in the vapor phase to form a dimer on the print. This reacts with another monomer, and another, eventually forming a polymer, a long chain of CAE molecules.

   c. The last phase is when the polymer chain reaction is terminated. The polymerization process may be restarted later if the prints prove to be underdeveloped with the first exposure to fumes. [NIJ Sourcebook, Chapter 7, Processing, pages 7-23 and 7-24].

B. Procedure

1. Methods of CAE fuming available for use in the laboratory:

   a. Atmospheric chambers (Foster Freeman MVC5000 and MVC3000)

   b. Fuming wands

2. Latent prints may or may not be visible to the unaided eye after exposure to superglue fumes, but may become visible after the application of fingerprint powders or dye stains. Latent prints developed with these methods are photographed or lifted. Under most circumstances, photography is the preferred method of capturing usable ridge detail.

C. Quality Control

1. Cyanobloom superglue is stored refrigerated.
2. To test the superglue, a test strip (control) of deposited fingerprints onto plastic, foil, or another non to semi-porous substrate will be processed prior to or in conjunction with the evidence. Position the control in such a way as to allow it to be monitored during the procedure.

   a. The test strip in an atmospheric chamber or with the use of a fuming wand can overdevelop and shall be monitored during the process.

   b. The test print will turn white in color displaying the latent print detail. This is a positive result that the process (equipment) worked.

   c. Troubleshooting: A test strip that does not develop may indicate the CAE fumes did not react with the deposited print and the following factors should be considered:

      i. Humidity levels: Eighty percent relative humidity is ideal for developing latent prints. Low humidity levels may result in the prints not re-hydrating enough to become visible using standard development techniques. To adjust humidity levels in the chambers, change the menu settings to increase relative humidity (see INS LP12). To adjust humidity levels for the fuming wand, add warm water to a container and place near the items to be processed or turn on a humidifier in the processing room for about 10-15 minutes.

      ii. Temperature of the heating element: The heating element in the chambers is preset to the optimal temperature depending on the type of glue used. White fumes will be visible if the fuming wands are heating the glue properly. If white fumes are not seen with the fuming wand, use a new glue cartridge. Also, ensure there is enough butane in the wand and that the butane is ignited. If there is no flame, the wand may need to be serviced; use a different wand.

      iii. Ability of the test strip donor to leave adequate ridge detail: Not all donors are able to leave sufficient detail either due to low eccrine secretions or lack of robust friction ridge skin. A different control print donor may be needed.

      iv. After all factors have been checked and considered, process a new test strip.

   d. Superglue that is heated and allowed to develop for too long can cause over-development. This is indicated by a very thick white residue with unclear ridge detail. It is important to monitor the control print during CAE processing to avoid this from happening to the evidence.

      i. When processing with the fuming wand, monitor the test strip and stop, remove, or turn off the heat source as soon as the proper level of processing has been obtained.

3. Any required troubleshooting or development problems must be documented in the test record and appropriate fuming chamber or wand maintenance log.

D. Application with Atmospheric Chambers
1. Foster Freeman VC5000 and MVC3000 Atmospheric Super Glue Fuming Chambers operating procedures:
   a. The chambers are capable of processing two types of superglue, Cyanobloom and Polycyano; however, only Cyanobloom is approved for use at the laboratory.
   
   Position evidence on shelf making sure the most surface area of the item to be processed will be exposed to the fumes.
   
   c. Ensure a test strip is in a location to allow for monitoring during the processing.
   
   d. Secure a disposable metal fuming tray with a small amount (approximately the size of a dime) of superglue on the warmer plate with the metal ring. Ensure the metal tray is seated flat on the warmer.
   
   e. Fill the water reservoir with distilled water to the marked indicator.
   
   f. Secure the chamber door.
   
   Press the Menu button and select the following settings:
   
   i. Glue time: **15 minutes**
   
   ii. Temperature for Cyanobloom: **120 degrees**
   
   iii. UV time (minutes): **Zero** for glue processing; this is only used for decontamination
   
   iv. Hold time: **Zero**
   
   v. Humidity: **80% RH**
   
   vi. Exit (arrow down) and the system returns to "Ready"
   
   h. Press the Auto button and the system will begin processing and will perform a programmed and required purge cycle at the end.
   
   i. Upon completion of the purge cycle, the door light will activate. Press the door button and the door will unlock.
   
   Evidence may be retrieved from the chamber.
   
   The water reservoir should be cleaned out following each use.

2. **Cleaning and Maintenance** is documented on the Foster Freeman MVC5000 and MVC3000 logs: [LPF.04 MVC 3000 Maintenance Log](file:///G:/SupSvcsBur/LAB/CLERICAL UNIT/SB 978/FSD Latent Print Docs/Contra Costa_38.html) [LPF.05 MVC5000 Maintenance Log].

   a. Humidity sensors are located in the windows of the chamber and should be checked every 24-36 cycles to ensure they are clean or during the monthly intermediate checks.
   
   Windows may become cloudy with build up of superglue and should be cleaned with approved cleaner (for example, the Mr. Clean Magic Eraser) to maintain clear windows for easy viewing of evidence.
c. Decontamination is performed by the following procedure:
   i. Secure the UV lights in the chamber: one per shelf
   ii. Press the Menu button and change the UV time to 30-40 minutes
   iii. Note: the system will automatically undergo a mini purge for approximately 10 minutes after the UV decontamination cycle
   iv. The door button light will turn on when the purge cycle is complete allowing access to the chamber
   v. Remove the UV lights without pulling on the cables

d. Filters are good for 75-80 purge cycles.

e. For further instructions and more information on maintenance and scheduled intermediate checks see LP18.

E. Application with Atmospheric Wand

1. Fuming Wand operating procedures:
   a. Ensure the wand has butane for fuel prior to use.

   □ Turn the wand on turning on the gas button and pressing the lighting button.

   c. A brass cylinder with superglue embedded in it may then be added to the tip of the wand.

   d. Once the brass cylinder is heated, visible fumes will be emitted from the end of the cylinder.

   e. The fumes should be directed to pass over the prints on a test strip. When a positive control is achieved, the surface of the evidence may be fumed.

   f. Care must be taken not to damage the evidence with the heat from the wand. Note: heat from the fuming wand may easily damage soft plastic such as plastic bags.

   □ When fuming is complete, turn off the gas button on the wand and replace the cap.

2. Fuming wand maintenance is documented on the log: LPF17.

F. Safety

1. The fumes from super glue are extremely irritating to the respiratory system and to the eyes, and the adhesive factors can be problematic if the glue gets on the skin or clothing. Laboratory coats, gloves and protective eye-wear should be used.

2. Be cautious when using the fuming wand. Though a flame may not be visible, the wand is extremely hot. The brass cylinder will become very hot and must not be touched; use a tool to add and remove from the wand. Allow the wand and used cartridges to cool prior to returning the wand to its container and discarding the cylinders.

1. NIJ Sourcebook, Chapter 7, Processing, pages 7-23 and 7-24

END OF DOCUMENT
I. Forensic light source equipment are used to enhance observation, development, and collection abilities on evidence which may produce ridge detail by inherent or chemical fluorescence. The Latent Unit uses Alternate Light Source (ALS) and Laser technology to assist in developing friction ridge evidence.

A. Intermediate checks

1. To avoid unintended adjustments, this equipment should not be moved around excessively and done so only when necessary. Caution will be used when transitioning equipment from one processing room to another.

2. To ensure the equipment is working as expected, a control is used prior to or in conjunction with every case. See LP.31 for an example of a good control (test strip) with the use of a forensic light source.

3. Should the control indicate equipment is not working as expected, a service call may be required and equipment will be taken out of service and labeled as such.
   a. Additional troubleshooting may be found in LP.31.

4. All maintenance done on the forensic light sources will be documented on the appropriate corresponding equipment form and maintained in the Latent Unit.

II. Rofin Polilight PL500

A. The Rofin Polilight PL500 is a 500 Watt forensic light source with twelve selectable and tunable filters. These filters represent output light bands used to view fluorescence, UV, or allow the ability to view blood (at 350nm) on a surface providing contrast. The purpose of the Polilight in latent processing is to view prints that fluoresce (inherently or in conjunction with a dye stain).

B. Procedure

1. Place the Alternate Light Source (ALS) on a solid surface, plug in the power cord, and turn the power switch on the back panel to the up (ON) position. The microprocessor conducts an initialization process that ensures all filter wheels and internal motors are in the correct position before the lamp is turned on. This warm-up process takes approximately ten seconds.

2. The control panel, located on the front of the unit, is used to select the desired wavelength. Push the button corresponding to the desired wavelength and the
selected output (e.g., 505nm) will illuminate in the filter selection display window.

3. To adjust the focus or intensity, use the filter and power tuning buttons located below the display window. To return to filter tuning, hold down the filter select button for a few seconds.

4. Use the focusing optic located at the end of the liquid light guide to enable the optical beam to be sharply focused. The focusing optic lens can slide in and out of the light guide.

5. Refer to LP.39 for further information on specific output applications with dye-stains.

6. Refer to the Rofin Polilight PL500 user manual for more general information INSLP.03.

C. Warning

1. Quickly turning on and off the Rofin Polilight PL500 can cause internal electrical damage to the unit. It is recommended to wait at least 30 seconds before turning the unit back ON after it has been turned OFF.

2. It is essential that cooling air be able to enter the Rofin Polilight PL500. Ensure that air flow around the unit is not obstructed. Air intakes are at the lower section of the front panel.

3. The Polilight is an optical instrument and the light guide is liquid.

4. The unit should not be subject to freezing conditions or water.

D. Safety

1. Care must be taken to avoid exposure to the beams from the Rofin Polilight PL500. To minimize unnecessary exposure, gloves, eye protection, and a Lab coat must be worn while operating the ALS.

   a. Exposure can be from the direct beam and from reflected beams. Eye protection is important not only for the operator but also for people within a 15 meter radius.

   b. UV protective goggles must be worn while viewing UV light.

   c. Orange, yellow, or red goggles must be worn while viewing the ALS light above the UV range.

E. Maintenance

1. As needed, the bulb may be changed on the Polilight.

2. See LP.18 Equipment Maintenance and LPF.16

III. Rofin Polilight-Flare

A. The Rofin Polilight-Flare is a cordless, battery powdered, lightweight forensic light source that uses LED output with center wavelengths of 380, 470, 505 and 530nm. These different light bands are used to view fluoresce.

B. Procedure

1. Hold the head of the unit with one hand and rotate the battery clockwise until a beep is heard signifying contact.
2. Turn the unit on by depressing the on/off button.

3. To replace the battery or filter head, rotate the battery counter-clockwise until it is released.

4. Disposable barrier sleeves located in the kit may be used. The sleeves slide over the filter head end of the unit.

5. Refer to LP.39 for further information on specific output applications with dye-stains.

6. Refer to the Rofin Polilight-Flare user manual for more general information INSLP.02.

C. **Charging the Unit**

1. Plug in the power adapter. The blue indicators on the charger will light momentarily indicating that the charger has gone through its microprocessor controlled test routine.

2. Insert the Polilight-Flare ensuring that the white arrow at the base of the unit lines up with the arrow on the charger. When the Polilight-FLARE is correctly inserted a continuous green light will illuminate. A red indicator light or a flashing green light indicates the battery is very low. If no indicator light appears reposition the Polilight-FLARE to correctly line up with the arrows.

D. **Safety**

1. Care must be taken to avoid exposure to the beams from the Rofin Polilight-Flare. To minimize unnecessary exposure, gloves, eye protection, and a Lab coat must be worn while operating the ALS.

   a. Exposure can be from the direct beam and from reflected beams. Appropriate eye protection is important not only for the operator but also for people within a one meter radius.

E. **Maintenance**

1. See LP.18 Equipment Maintenance and LPF.15

IV. **Coherent TracER Laser**

A. The Coherent TracER Laser is a compact, fully hand-portable, modular color, laser-based system designed to excite fluorescence. The laser produces one fixed output wavelength of 532nm.

B. **Procedure**

1. Place the laser on a sturdy surface and plug in the power cord to maintain operation.

2. Press the orange button and turn the key clockwise to the ON position to begin use.

3. The intensity can be controlled by the front panel of the laser or by the panel on the hand-held device. To switch between the two, press the Laser Control button on the hand-held device.

4. The laser power button on the hand-held device can be used to switch between high power (5 watts) and low power (1 watt).

5. To control the intensity on the front panel of the laser, turn the Power Adjust knob.
6. The wattage output is displayed in the Output Power window on the front panel of the laser.

7. Be sure to turn both the key and the laser to the OFF position when finished.

8. The operator must be cognizant of how close the laser is to the evidence to ensure that the evidence does not burn or melt as the laser does produce heat.

C. Safety

1. **Eye protection**: Orange barrier filter (Argon) goggles must be worn to prevent eye injuries. These goggles must be worn by anyone in the room while the laser is in use.

   a. Whenever possible, the laser will be used in a room or area that can be closed off to avoid accidental exposure to other people without eye protection.

2. In addition to eye protection, the operator will also have on a Lab coat and gloves to prevent unnecessary exposure.

D. Maintenance

a. The laser offers a long-life battery and requires little to no maintenance.

b. The fan filter in the rear of the laser box should be monitored and occasionally wiped for dust so that it does not become clogged.

   a. If the filter does become clogged and causes overheating, the built in thermal interlock will prevent damage to the laser.

c. As needed, the hand piece may need to be carefully and gently wiped with a non-scratch cloth.

d. See LP.18 Equipment Maintenance and LPF.48
I. Policy: Images taken for the purpose of friction ridge examination must be treated as evidence. Images taken for the purposes of documentation may be treated as notes.

A. Packaging and Retention of Digital Image Evidence

1. The Latent Unit adheres to division policy regarding the rejection of observations, data, and results with the following clarification.
   a. An analyst may reject their own observation or data (photographs) during the course of performing casework and not retain the photograph if the rejection is documented in the test record with their initials, date, and reason for rejection.
   b. Reasons to not retain a digital image may include blurriness, duplication that does not add quality or clarity to an existing photo, or under/over exposure etc.

2. Images of ridge detail will be saved onto electronic media, properly packaged, and treated as evidence.
   a. See FSD.35 and LP.09 for information about evidence handling and chain of custody requirements and FSD.42.01 for information about treating an image as evidence.

3. Images will be uploaded into the VeriPic Digital Image Manager system. For information about VeriPic see QA.21.

B. White Light Photography

1. Place the item to be photographed with a scale on butcher paper in the view of the mounted camera.
   a. Open window: EOS Utility
   b. Select option: Remote Shooting
   c. Open window: Live View Shoot
   d. Arrange the item to be photographed so that the latent print appears in the live view window on the computer screen.
      i. In the remote live view window task bar (on the right side), make sure the Focus drop down menu has "Live 1-point AF" selected

2. Saving the image(s):
   a. Select the folder or preferences button
   b. Destination Folder Tab: Click on the browse button and select the location to save the image(s) (e.g., U: drive).
   c. Remote Shooting Tab: Rotate Image selection will save the orientation of the photo (portrait or landscape), however may affect the images when printing 1:1.
3. General Canon 6D Mark II settings:
   a. **Focus**: The image can be focused by using the focus ring on the camera or by selecting the focus button on the live view screen.
   b. **White Balance**: Adjust as needed.
   c. **Aperture/F-stop setting**: Adjust as needed by right clicking on the F-stop display.
   d. **Brightness**: Adjust as needed using the brightness display and selecting the right (brighter) or left (darker) arrows.
   e. **Picture Rotation**: Rotate as needed using the curved arrow shaped buttons in the lower right hand corner of the screen. The image will rotate in 90° increments.
   f. **Capture Image**: Click on the large round button in the upper right hand corner of the screen (or use the mounted camera).
      i. The Digital Photo Professional screen will open displaying the captured RAW image.
      ii. If captured image does not appear, check location of saved image (e.g., U: drive).

C. **Fluorescent Photography With Forensic Light Source**
   1. Set the **Mode Dial** on the camera to B (bulb).
   2. Add the appropriate filter to the lens of the camera.
      a. Using the live-view feature, test available filters to determine which filter, or combination of filters, yields the best quality, detail, and background contrast.
   3. Click on the shutter button on the EOS Utility 3 screen. A timer will appear on the screen next to the shutter button. This allows for tracking of the exposure time. To stop the timer, press the shutter button again.
   4. The Digital Photo Professional screen will open displaying the captured RAW image.

D. **Digital Photo Professional Screen**
   1. View the image(s) captured for sufficiency.
   2. If necessary, make adjustments to settings, item, or lighting and re-take the photo until image is suitable for examination.
   3. Images determined to be suitable for examination must be converted to TIFF.
      a. Highlight the image
      b. Select **File/Convert and Save**
      c. Select **TIFF**
      d. In the File name section: type the *item #, lab #, description of item, and type of processing technique used* (e.g. CAE-RAM).
         i. Note: item # is labeled the same as a latent lift card following the LIMS itemization.
      e. Select **OK**. There is now a RAW image and a TIFF working copy of the image.
      f. Save image(s).
4. Rename the original RAW image(s) to match the TIFF file name(s), or keep the camera designated image number in both titles so that the two files (RAW and TIFF) can be separate and identifiable.

5. **Note:** Suitability or print value determinations are not typically made during processing, but rather after the photography has been completed.

**E. Photoshop**

1. Photoshop edits are made to the working copy image.

2. Photoshop will be used to annotate any latent prints of value, following LIMS itemization.
   a. Include an asterisk for ABIS quality prints.

3. Select the *Text* icon and set the font color to red.

4. The annotation should be in line with the orientation of the print.
   a. Select *Control T* or *Free Transform* from the tool bar and move as needed.

5. Save by adding "with annotation" to the image file name. No layers need to be saved.

6. Refer to LP65 for additional Photoshop processing procedures.

**F. Printing Out Images** (optional):

1. *Digital Photo Professional* software can be used to print individual images or contact sheets on the *HP Officejet Pro x451dn* photo printer.

**G. Quality Assurance**

1. **Purpose**
   a. Digital imaging workflow is not based on the physical size of the capture device (as was the case with film cameras photographing at 1:1), rather, it is based on the *resolution* required to capture the necessary detail in the digital image file. SWGFAST and NIST guidelines specify friction ridge impressions to be used for comparison purposes will be captured (color or grayscale) at a *minimum resolution of 1000 pixels per inch (ppi)* when the image is sized 1x or 1:1. While the 1000 ppi resolution standard permits the capture of level three detail in latent prints, it does not mean that any image recorded at a lower resolution would necessarily be of no value for comparison purposes.

   b. The relationship between nominal resolution and achievable resolution (resolving power) can vary greatly from different manufacturers. To determine that a camera is capable of capturing an image at a given resolution, it is necessary to use a *resolution test target*. The purpose of this procedure is to test the ability of the camera system to capture the necessary level of detail when viewed on a monitor.

   c. The 18-55mm f/3.5-5.6 zoom lenses, individual crime scene cameras, and Surface Pros may be used to capture overall images taken for documentation purposes only. However, these cameras and camera lenses *may not* be used to capture friction ridge impressions at the laboratory, and will not be used to conduct the resolution test.

2. **Frequency**
   a. In order to consistently and reliably capture images at the required resolution (1000 ppi), the digital cameras shall be tested *annually* in at least one configuration commonly used with the macro lenses.

   b. If the camera has been repaired, the camera will be re-tested prior to use.

3. **USAF 1951 Resolution Test Target**
a. The test target used in the Latent Print unit is a 2" x 2" piece of glass from Edmund Industrial Optics with a positive (chrome on clear background) resolution test pattern. The pattern tests the resolving power of the camera to capture latent prints for on screen analysis and comparison purposes.

b. The format consists of six "groups" in three layers of patterns. The largest groups, forming the first layer, are located on the outer sides. The smaller layers repeat the same pattern but are progressively smaller towards the center. Each group consists of six elements, numbered one through six.

c. Resolution for the test target is stated as line pair per millimeter (lp)/mm. The patterns repeat at a given frequency and may be referred to as cycles per unit of distance. A line pair means a black and white line.

d. Because nominal resolution of 1000 ppi corresponds to an achievable resolution of approximately 9.8 - 13 cycles per millimeter, any target within this range would be sufficient. The highlighted sections of the table below correspond to an acceptable performance check (at least Group 3, Element 3 or higher). A performance check resulting in a resolution higher than 1000 ppi is also considered acceptable.

e. Reference Table (from Edmund Optics Website)

f. A resolution lower than the 9.8-13 cycles per millimeter (approximately 1000 ppi) is considered unsatisfactory. If there is an unsatisfactory performance check, the check will be repeated. If negative results continue, a Supervisor must be notified.
immediately and steps taken to correct the problem which may include, servicing or replacing the camera(s).

4. **Procedure-Field of View Determination to achieve a minimum of 1000 ppi**
   a. Specifications for the Canon 6D Mark II are 26.2-megapixel camera with 6240 x 4160 effective pixels (in RAW format).
   b. Dividing the pixel resolution by 1000 pixels per inch yields 6.240 x 4.160 inches (approximately 6 x 4 inches). This represents the area of coverage in which the camera should be capable of capturing at 1000 ppi.
   c. The height at which the camera can stay in focus while filling the view with the area noted above is the maximum camera-to-subject distance to provide 1000 ppi resolution.
   d. The height for using a zoom lens is designated on the copy stand with a white line. The lower portion of the arm of the copy stand holding the camera (once secured to the copy stand) should be aligned with the designated height.
   e. Using the test target
      i. Place the resolution test target face up on the copy stand.
      ii. Follow the normal procedures for capturing an image of an item using the digital camera and scale, using manual focus and manual exposure controls.
      iii. Open the image in the Windows Picture and Fax Viewer (if in TIFF format) and/or in Photoshop (RAW or TIFF format) and crop image to approximately 1 inch by 1 inch.
      iv. Do not manipulate or rotate the image.
      v. Cameras may have different resolutions in vertical and horizontal directions. To measure those independently, the resolution target has horizontal and vertical oriented bars.
         1. With the view set at 100% (original view), look on the computer screen for the element in which you can just differentiate with your eyes, two adjacent bars and still recognize the white gaps.
         2. Read the element's number and group affiliation then determine the resolution of the camera using the reference table in the policy.

5. **Documentation**
   a. A **Printscreen** of the test target in the viewer will be printed out the element number and group affiliation from the test will be recorded. The date, staff member performing the check, and letter of the camera tested will be documented on the printout which will be retained in the maintenance binder with the completed maintenance log (**LP.08 Camera Maintenance log**) for the appropriate camera.

END OF DOCUMENT
I. Policy: Technical review is an in-depth examination of analysis records and test reports to ensure that the reported conclusions and interpretations are reasonable, and supported by sufficient documentation and data. The Latent Unit technically reviews all casework examinations.

A. A technical review is independent of a verification.

B. A technical review may be independent of or combined with administrative review.

C. The administrative review milestone in LIMS reflects the technical and administrative review of the case.

D. A technical review will be conducted by individuals that have been found competent in the latent print discipline, and have been authorized by the laboratory to perform technical reviews.

E. Technical reviews will not be conducted by the author or co-authors of the test records under review.

F. The technical review process does not shift responsibility for ensuring the accuracy of results and conclusions from the analyst to the reviewer. Both individuals share a responsibility to ensure the quality of the reported results.

G. For more information about technical review see FSD.17.

II. Procedure

A. A technical review will consist of ensuring technical record components are correct. The components include:

1. Approved technical procedures were used and documented.
2. Any deviations from policy were documented, and approved by the Unit Supervisor or Technical Lead.
3. Results are properly transferred from the technical record(s) to the report.
4. Technical record(s) support the results and conclusions made in the test report.
5. All Identifications and Exclusions are verified.
6. All Inconclusive results are properly qualified.
7. All latent prints meet quality standards as outlined in LP.19.
8. Prints determined to be of "no value" are reasonable based on criteria outlined in LP.19, requiring that prints lack sufficient and clear first and/or second level detail. This includes latent evidence submitted to the lab on lift cards or photos, as well as evidence generated at the lab from items processed.

9. Evidence description and inventory are properly and appropriately stated.

10. Work requested was completed, or a reasonable explanation is reported as to why work could not be done.

11. All latent lift cards and photographs are properly numbered and itemized, dated and initialed; and digital images are properly named, annotated, and in proper format. For example, TIF or RAW format.

12. All the exemplars used are included in the technical records, and are properly labeled. For example, the dates of comparisons and initials of the analyst and verifier.

13. Instrumental documentation are included in the technical records to demonstrate all ABIS quality prints were searched in appropriate databases, and minutiae appropriately marked. When applicable, documentation of a second search must also be included.
   a. Correct latent ID number, lab number, database searched, and any other pertinent identifying information are on all ABIS printouts.

14. Appropriate comparison documentation is included and supported. For example, GYRO mark-ups and analysis documentation from analyst and verifier.

15. Documentation of the appropriate use of the following:
   a. positive and negative reagent controls.
   b. processing techniques and in the correct sequence.
   c. lot numbers and expiration dates.
   d. equipment and instruments.

16. Ensure that all evidence was properly itemized and transferred in LIMS, including "split via" when applicable.

17. When applicable, proper collection of biological and trace material.
   a. As applicable, a recommendation for potential further work.

B. Any inconsistencies found by the technical reviewer regarding results, supporting data, or other documentation reviewed, will be noted and tracked on the Technical Review Checklist. See LPF.50

1. The technical review checklist will be maintained with the case file.

2. Any differences in results or supporting data must be resolved prior to issuing a final result and report.

3. If the technical reviewer and case analyst are unable to reach an agreement after consultation, the conflict resolution process will be initiated and the Unit Supervisor will be notified.
a. Conflict resolution is a process that occurs after all communication between the original analyst and the technical reviewer has been exhausted, and the discrepancy can not be resolved. The Unit Supervisor will promptly schedule a meeting with both analysts to discuss the discrepancy and determine the most suitable resolution.

b. If the case analyst does not agree with the final decision, the case will be reassigned. All original documentation of consultations and conflict resolutions will be retained in the case record.

4. Serious or repeated technical issues will be reported to the Unit Supervisor.

C. Releasing Results Prior to Completing the Report

1. The review that is conducted on a select item is a comprehensive technical review, no different from that which is done at the completion of a case. A comprehensive technical review must be conducted prior to verbally releasing results. The technical reviewer will document the review in the notes which will include the date, initials of reviewer, and what elements were reviewed. See FSD.43 Test Report.

III. Criteria for becoming a Technical Reviewer

A. For an analyst to be authorized to conduct Technical Reviews, certain goals must be met to the satisfaction of the Unit Supervisor and/or Technical Lead. The following outlines these requirements:

1. The analyst must have conducted casework in the component of Friction Ridge Examination that is under review for at least one year.

2. The analyst must complete a minimum of 20 "supervised" Technical Reviews to the satisfaction of the Unit Supervisor and/or Technical Lead.
   a. The "supervised" Technical Reviews must include all components of casework (Processing, Comparison and ABIS cases) to be authorized to perform reviews of all casework.
   b. Feedback will be provided to the analyst by the Unit Supervisor and/or Technical Lead.

3. Once the above requirements are met, and the analyst has demonstrated competence in the Technical Review Process, authorization will be granted.

IV. Technical Review of Testimony

A. At least annually, analyst's court testimony will be technically reviewed by a competent individual in each discipline in which they have testified.

B. Testimony that is technically reviewed, should occur on Comparison casework; however, any casework testimony will meet this requirement.

C. Testimony technical review is typically documented on the Internal Court Critique Form FSDF.02 according to the procedure outlined in QA.13.

D. See FSD.26 for more information of courtroom testimony requirements.

END OF DOCUMENT
I. POLICY    The Supervisor will be notified and take action to limit or remove any factors that may negatively impact safety of personnel, evidence or test results.

A. Introduction

1. The effects of human factors on latent print analysis was addressed when the National Institute of Standards and Technology (NIST) convened "The Expert Working Group on Human Factors in Latent Print Analysis" to conduct a scientific assessment of the effects of human factors on forensic latent print analysis and to develop recommendations to reduce the risk of error. Their report documents their findings and recommendations, addressing issues ranging from the acquisition of impressions of friction ridge skin to courtroom testimony, from laboratory design and equipment to research into emerging methods for associating latent prints with exemplars (see LAT.308). It provides a comprehensive discussion of how human factors relate to all aspects of latent print examinations including communicating conclusions to all relevant parties through reports and testimony.

2. Factors affecting latent print examination originating with issues related to the quantity and quality of the friction ridge impression and/or the methodology are addressed in LP.19.

B. Human and Environmental Factors Affecting Examinations

1. General

   a. A thorough analysis of workstations, job demands, mental workload, organizational characteristics, training needs, and supervisory systems is necessary to facilitate and enhance performance.

   b. The analyst has a responsibility to ensure they are mentally and physiologically capable of performing their job duties, and are not to perform latent print casework if they are aware of factors that may negatively affect their work product and/or test results.

2. Physical Environment

   a. The following are a list of some factors that may affect an analyst's performance:

      i. Lighting: Various types of desk lamps are available to the analysts. Each analyst will inform their Supervisor if they believe their lighting is insufficient or inappropriate so that the problem may be remedied.
ii. **Noise**: Laboratories have increased levels of noise and movement due to multiple processes occurring over multiple work areas. While it is understood that there will be some level of noise in the workplace, if an analyst believes there is too much noise and it is having a negative impact on the work product, they will inform their Supervisor.

iii. **Temperature**: The temperature is set by General Services Division (GSD) employees; however, if the temperature becomes uncomfortable and affects work product and/or health, GSD can be contacted by a Supervisor or Manager to have the temperature changed.

iv. **Workspace Layout**: Analyst's may request to have an ergonomic evaluation. Analyst's may work with the evaluator to determine the best workspace set-up for the job duties they perform.

v. **Distractions/Interruptions**: Due to the nature of the work performed in the Laboratory, there will be distractions and interruptions, but they should be kept to a minimum and any routine distractions will be brought to the Supervisor's attention.

vi. **Ventilation**: Proper ventilation should be maintained in the Laboratory. Due to the nature of the work in the lab, there are times in which the air quality may decrease (i.e. odors). The Supervisor or Manager should be notified so that any air quality deficiencies can be remedied.

3. **Human-System Interface**

   a. Analysts in the Latent Print Unit will be utilizing computers with software applications, scanners, copiers, printers, digital photography equipment, alternate light sources, and other forms of informational technology and laboratory equipment. Based on the resources available, options and preferences should be selected that optimize the displays and controls.

      i. Some of the software programs offer alternate screen color options that may be utilized by the analyst based on their preference.

      ii. The ABIS system has been installed on each analyst's desktop to increase efficiency and limiting the need to carry case files and evidence to various locations. This set-up also allows for each analyst to customize the color scheme and settings that work best for them.

4. **Human Factors**

   a. The following are a list of factors that analysts need to be aware of before performing latent print examinations:

      i. **Knowledge, skills, and experience**: The Laboratory has a training program for latent print analysts and also provides continuing education and professional advancement through conferences, classes, study groups, providing books and journals, and routine staff meetings.

      ii. **Sensory and physical capabilities (including alertness and fatigue)**: If the analyst is aware of sensory and physical limitations that will affect their job performance, they will follow department policies in notifying management of their inability to perform their job duties.
1. In situations in which the analyst may have some limited capabilities, the Supervisor may assign acceptable tasks that are within the analyst's capabilities that would not negatively impact casework.

iii. **Biases**: If the analyst is aware of potential bias in their casework, the analyst will notify their Supervisor who will reassign the case. The Supervisor and the analyst will also take precautions to ensure that contextual bias is limited to only necessary information (i.e., not reading police reports).

END OF DOCUMENT
I. Introduction
   A. The balance is a tool used for measuring ingredients when making working and stock solutions.
   B. The Latent Print Unit does not have critical measurements with regard to weights.
   C. To prevent unintended adjustments after annual calibrations, the balance will be left in place and not moved from it's location in the Latent Unit.

II. Procedures
   A. For detailed instructions see INSLP.22.
      1. Ensure the balance is ON
         a. If the balance was off, wait 30 minutes prior to use.
      2. Remove the draft cover.
      3. If using a weighing media (e.g. weigh boat or paper) place the weighing media near the center of the scale and tare or "zero" the balance.
      4. If not using a weighing media, tare or "zero" the balance before use.
      5. Place item to be weighed (in weighing media if applicable) on the scale, near the center.
      6. Close the draft cover.
      7. Weigh item. Allow enough time for balance to settle.
      8. It is important to keep the scale as clean and free of chemicals as possible.
      9. Be sure to wipe down the scale before and after each use.
   B. Calibration
      1. For maintenance and calibration information see LP.18.
      2. No scheduled internal calibrations or adjustments will be performed by laboratory staff. Only optional intermediate checks may be done when necessary.
   C. Intermediate Checks
1. If there is an indication of a technical issue, the balance should be checked. The procedure for checking the performance of the scale is as follows:
   a. Make sure the balance is on. Use the laboratory supply of standard weights.
   b. **Do not handle the weights with bare hands as oils and contaminants may affect them. Use the tweezers to pick up each weight and place them on the scale. Also use this method to return the weights to the box.**
   c. Record the displayed weight next to the corresponding reference standard weight (e.g. 1g: 1.000 g) on the Latent Digital Scale Log (LPF.03) which will be maintained in the Latent Unit.
   d. Follow the same procedure for checking the weights listed on the Log and complete the form.
   e. Return the reference standard weights to their location.

2. **Satisfactory**
   a. See table below to determine satisfactory performance.
      
      | Weights equal to or less than 10 grams | Weights greater than 10 grams |
      |----------------------------------------|-------------------------------|
      | +/- 0.005 grams of target               | +/- 0.020 grams of target     |

3. **Unsatisfactory**
   a. If the displayed weight of the reference standard is outside the limits of the above table, the intermediate check is determined to be unsatisfactory.
   b. An unsatisfactory result requires the check be repeated.
   c. If the check fails again, the scale will labeled **Out of Service** and all users notified.
   d. The equipment will be repaired or replaced before being put back into operation.
   e. Actions taken to repair or correct the problem will be documented on the Latent Digital Scale Log.

END OF DOCUMENT
I. The goal of the training program is to provide uniform quality training in each component of friction ridge examination to laboratory personnel. The training program is intended to equip the trainee with the knowledge, skills, and abilities required to conduct casework. The aspects of training will be addressed through training modules, as listed below.

A. Introduction

1. This training program is based on the training standards for friction ridge examiners as outlined by SWGFAST and OSAC.

2. The trainee must demonstrate knowledge of the required objectives in each module by successfully completing written tests, practical exercises, and examining case-like materials (as applicable) throughout the training program.

3. Training will consist of hands-on practice, literature review, lectures, presentations, and demonstrations. The demonstrations will include shadowing experienced staff with casework, observing courtroom procedures and testimony, and other routine duties. The trainee must demonstrate an understanding of the objectives and underlying principles via modular quizzes or tests and court-related questions or mock trial.

4. Training is multi-faceted and ever changing. Should a new processing technique or other change occur within the field of friction ridge examination during the examiner's training period, the program may be modified as needed.

5. The modules do not need to be completed in sequential order. Training will be tailored to the trainee's job duties and to the extent the trainee will conduct casework.

6. When feasible to do so, trainees without prior experience in friction ridge analysis should begin the training program by attending the Sheriff's Department Central Identification Services Fingerprint Academy, to gain foundational knowledge.

7. All trainees should attend external training courses recommended by the unit Supervisor, Training Coordinator, or Technical Lead.

B. Coordination and Overview of the Program

1. The Training Program will be coordinated by a designated Training Coordinator (TC). The TC may be the Latent Unit Technical Lead, a designee, or the unit Supervisor.
a. The Training Coordinator will be responsible for the overall training, but may choose to delegate certain duties or blocks of instruction to other qualified staff.

2. Analysts assigned as trainers must have acquired and maintained proficiency for a minimum of two years in the topic areas that they instruct.

3. Trainers must maintain accurate and complete documentation of subject areas covered.

4. The length of the training period will vary depending on the extent to which the trainee will conduct casework. Also taken into consideration is prior coursework or experience as well as the trainee's aptitude for the material. The unit Supervisor or TL and TC will set the expected timelines for training based on these factors.

5. Training is estimated to take approximately one year (full-time) for those individuals becoming competent in all aspects of the latent print discipline (Processing, Comparison, ABIS). The majority of the time in training will focus on Analysis, Comparison, and Evaluation of latent impressions.
   a. SWGFAST standard (Document #18) requires one year minimum, but recommends two or more years of full-time latent print work with the majority of the time spent on Analysis, Comparison, and Evaluation of impressions.
   b. The modules pertaining to processing should require approximately 3 months. The modules pertaining to Comparisons and ABIS training should require approximately 9 months.

6. The various quizzes and activities throughout each module will be graded on a Satisfactory/Unsatisfactory basis.

7. The practical exercises and test samples serve as a means to monitor the trainee's ability to apply the tools they have been given during the training program.

8. The written exams and quizzes may have multiple choice, true/false, fill-in-the-blank, and/or essay type questions.
   a. A Satisfactory score on a quiz or written test requires at least 80% accuracy.
   b. A Satisfactory score on a practical comparison tests (latent comparisons) requires 100% accuracy.
   c. A rating of Unsatisfactory in any module will result in re-testing.
      i. Failure of the retest would result in remedial training of that module.
      ii. Failure of three or more modules or exams may result in the elimination from the training program.

9. Should a trainee demonstrate a limitation or deficiency which may impact successful completion of the training program, the TC will notify the unit Supervisor to evaluate the best course of action.

10. The trainer is expected to provide feedback and guidance to the trainee throughout the training program.
11. The training program has a total of three Competency Tests. See below for Competency Test details.

12. A final examination consisting of a mock trial will be given to individuals who have completed all three competency tests representing the three components of friction ridge examination. See Mock Trial below.

13. Upon completion of the training program, the trainee is expected to provide written or verbal feedback to the TC and unit Supervisor regarding the training program. This documentation will be maintained in LIMS.

C. Orientation

1. Before beginning the training program, a new employee will receive orientation to the operating facilities and personnel, and a work/study area will be assigned. An orientation checklist (see FSDF.01) will be used to ensure applicable topics are covered. The checklist will be retained per FSD policy (see FSD.47).

2. The trainee will be introduced to PowerDMS and will be assigned the following mandatory reading of policies and procedures:
   a. FSD Manual
   b. Quality Manual
   c. Latent Section Technical Manual
   d. Latent Section Training Manual
   e. FSD Safety manual

3. The outline of the training program and an explanation of the expectations of both the trainer and the trainee will be discussed.

4. A time line for the training program will be provided to the trainee and completion of each training module will act as milestones of achievement.

5. There will be an introduction to the technical capabilities of the laboratory, to include the agencies served.

6. An explanation of the operation of local, state and federal law enforcement agencies and court systems will be provided.

7. The trainee will be expected to learn the laboratory's LIMS.

D. Expectations of Trainee

1. The trainee is expected to keep a notebook or binder of information compiled during the training program. Copies of written examinations, practical exercises, presentations, or other items prepared during training should be maintained by the trainee and reviewed by the trainer.

2. Documentation of completed reading assignments and checklists for each module should be maintained.

3. Reading assignments throughout the program modules are not exhaustive lists. Additional reading is encouraged.

4. At the discretion of the unit Supervisor or TL and TC, and as the trainee becomes capable and authorized, the trainee may collaborate on casework under the
supervision of a qualified examiner to gain hands-on experience. The following are examples of ways in which the trainee may assist an examiner:

a. Assist with the screening duties of lift cards.

b. Data entry only of latent prints into the ABIS database.

5. Study time for the trainee is not restricted to on-duty hours. Trainees may wish to devote some off-duty time to their studies to complete the training program in a timely manner.

6. Trainees are expected to communicate any concerns about their training to their TC, or if needed to the TL and Unit Supervisor.

E. Guidelines for Competency

1. The latent unit has three components of competency testing (Processing, ABIS, and Comparisons) which mirror the three main testing services provided by the latent unit. The competencies include practical and written exams, testimony-like questions (verbal test), as well as issuing a report in LIMS.

a. Whenever feasible, the samples used for the practical portion of the Comparison competency are provided by an external vendor.

   i. Successful completion of the Comparison practical exam requires a score of 100%. Erroneous conclusions will result in an unsatisfactory rating for this section.

b. The samples used for the practical portion of the ABIS and Processing competencies may be created internally.

   i. Successful completion of the ABIS practical exam requires a score of a 100% hit rate when searching the database(s).

   ii. Successful completion of the Processing practical exam requires applying the proper development techniques in their appropriate sequence to recover latent prints.

c. Successful completion of the written ACE-V/ABIS and Processing exams require a score of at least 80%.

   i. It is recommended that the written test be given to the trainee before the practical exam.

d. Successful completion of the verbal test will be determined by the TC, TL, or Supervisor to ensure materials learned were well understood and communicated by the trainee. For a trainee to obtain a Satisfactory rating on the verbal test he/she must be able to clearly articulate the following:

   i. A summary of the training and courses taken as applied to the subject area(s) learned - Statement of Qualifications.

   ii. Technical correctness to the answers presented.

   iii. Ability to accurately and understandably convey answers.

e. If the Competency is deemed Unsuccessful, remedial training and/or an additional Competency test may be necessary. For technical errors in a Competency, see FSD.15
2. For the practical portion of the competency tests, the trainee is expected to apply all applicable policy and procedures in accordance with the FSD and Latent Technical Unit manual.

3. The analyst will be provided feedback after the completion of each competency test.

F. Modules

1. The following is a list of modules for the training program:

   a. LPT.02 Introduction to and the History of the Science of Fingerprints
   b. LPT.03 Biology and Physiology of Friction Ridge Skin
   c. LPT.04 Pattern Interpretation
   d. LPT.05 Classification of Record Prints
   e. LPT.06 Recording Friction Ridge Skin
   f. LPT.07 Latent Print Development
   g. LPT.08 ACE-V Method
   h. LPT.09 Automated Database Searching
   i. LPT.10 Forms, Records, and Reports
   j. LPT.11 Evidence Handling
   k. LPT.13 Resources and Certification
   l. LPT.14 Ethics, Legal Aspects and Forensic Science
   m. LPT.15 Final Examination

G. Mock Trial

1. A final exam consisting of a mock trial will follow the successful completion of the modules and the three competency examinations. The Supervisor and/or Technical Lead will assess the individual's performance. The performance of the individual will be determined to be either Satisfactory or Unsatisfactory (see LPT.15). If the performance is deemed to be Unsatisfactory, remedial training will be provided.

2. Documentation of the mock trial will be on a court critique form.

H. Training Documentation

1. After successful completion of the modules, the Supervisor, TC, and TL will complete the appropriate module checklists.

2. The TC is responsible for ensuring that the Latent Print Training Records are completed in a timely fashion as training progresses. The appropriate spaces on the training checklist will be initialed and dated as each area is completed.

3. After successful completion of each competency examination, the Unit Supervisor and Technical Lead will complete the appropriate authorizations.

   a. LPF.40 - Authorization to Perform Latent Print Automated Database Search Casework
   b. LPF.41 - Authorization to Perform Latent Print Comparison Casework
c. LPF.42 - Authorization to Perform Latent Print Screening and Processing Casework

I. Transition from Trainee to Examiner

1. Upon completion of the training, and having been granted authorization, the trainee will have attained the necessary knowledge, skills and abilities to independently perform casework. The Unit Supervisor and/or Technical Lead will monitor the new examiner's casework for a period of time following authorization (supervised casework). Documentation of the supervised casework will be in the examination record. In addition, the Supervisor and/or Technical Lead should accompany the newly qualified examiner to court for the first few court appearances.

2. It is anticipated that the new examiner will require approximately one year of full-time latent casework (primarily in comparisons) to solidify their abilities and to lay foundation for becoming an accomplished latent examiner. This should be considered when assigning the new examiner to cross training in other disciplines.

J. Assessment/Abbreviated Training of Experienced Personnel

1. The Unit Supervisor and/or Technical Lead is responsible for assessing the new hire's prior training and experience.

2. Some content or sections of this training program may be skipped for examiners with prior training and who can demonstrate to the Supervisor and/or Technical Lead a comprehensive knowledge of the subject matter.

   a. A person with prior experience may not be required to complete all or parts of the training program if the following are met:

      i. the prior training program covered all aspects of Friction Ridge Examination.

      ii. the prior training program was administered by a reputable organization and/or trainer.

      iii. the prior training program was about one year (full-time).

3. The new hire's training records, transcripts, statement of qualifications, etc. will be reviewed.

4. Prior to administering their competency test, the new hire will be given hands-on practicals to acclimate to their new work environment (e.g. case-like materials or exams).

5. Prior to authorization to perform casework, the new hire must successfully complete a competency test and mock trial or court related questioning.

6. Prior to conducting casework, appropriate authorization form(s) must be completed. See above for authorization forms.

7. The employee's casework will be monitored for a period of time (supervised casework) following authorization. The supervision will be documented in the examination record. In addition, the Supervisor and/or Technical Lead will, at minimum, accompany the employee to their first court appearance.

K. Remedial Training and Re-training
1. **Remedial training** is designed to remedy issues that arise after an analyst is deemed competent. Remedial training may be a course of action taken after the realization of non-conforming work (e.g. a failed proficiency, a repeated level 2 non-conformity, a corrective action etc.). The remedial training will include one or more of the following:
   a. repeating relevant training modules
   b. literature review
   c. review of policies
   d. practical exercises

2. The analyst will be given a predetermined timeline for completion of the remedial training.

3. The Supervisor will be responsible for overseeing and documenting the remedial training.

4. A competency test will be issued to evaluate the effectiveness of the remedial training.

5. Feedback on the remedial training process as well as a review of the training program will be conducted.

6. **Retraining** (Refresher training) may occur for a number of reasons, such as an absence from the latent unit for one year, at the request of the analyst for any reason, procedural modifications during their absence, or as deemed necessary by the Unit Supervisor and/or Technical Lead. A competency test will be required if new methodologies, techniques or equipment have been introduced during their absence.
   a. A newly competent analyst may require more retraining prior to resuming casework than an analyst with years of latent experience following an absence in the unit.
   b. After a 12 month absence, the analyst will be expected to pass a proficiency test prior to resuming casework.

L. **Continuing Education**

1. All analysts should participate in continuing education to broaden and maintain their skills and expertise in the latent print discipline. Training received will be documented as outlined in QA.12.

External training courses or programs including, but not limited to, Webinars and classes offered by Forensic Technology Center of Excellence, DOJ California Friction Ridge Study Group, Ron Smith & Associates, California Criminalistics Institute, Evolve Forensics, Elite Forensic Services, Stapleton and Associates, as well as CSDIAI and IAI conferences should be attended to complement training assignments and exercises contained in this manual.

The effectiveness of on-going training will be monitored and evaluated by the Latent Unit Supervisor and/or Technical Lead in one or more of the following ways:
   a. Requiring a teach back from the analyst attending the training (or feedback regarding the training) during a unit meeting.
b. Evaluating yearly proficiency test results.
c. 100% Tech and Admin review of casework.
d. Court testimony monitoring.
e. Rotational presentations of various topics to the unit by staff.

M. References used throughout the training program include, but are not limited to the following:

1. Fingerprints and the Law, Moenssens
2. Fingerprint Techniques, Moenssens
3. Qualitative-Quantitative Friction Ridge Analysis, Ashbaugh
4. "The critical Stage of Friction Ridge Skin and Pattern Formation", Wertheim and Maceo
10. Friction Ridge Skin, Cowger

END OF DOCUMENT
I. Selection

A. Supplies and services are designated into two broad categories:

1. General supplies and services that do not affect the quality of tests, including office supplies. Requirements in this policy do not apply to these items.

2. Supplies and services that affect testing and have an impact on the quality of results.

B. Most reagents and supplies in the Latent Unit are purchased solely for use by the Unit. These reagents and supplies are selected for their specific use in testing.

C. The Unit Supervisor or Technical Lead will evaluate vendors of externally provided products to ensure their suitability for use in testing. Reagents and supplies are selected based on one or more of the following criteria:

1. The vendor's product is specified by the technical procedure.

2. The vendor supplies a certificate of analysis specifying the grade.

3. The vendor providing consumables is the manufacturer of the instrumentation for which they are used.

4. The laboratory has a prior history of satisfactory service with the vendor product.

D. Once a product is evaluated and approved for use, for example through validation or as supplied for use with an instrument, it will be ready for use in casework and may be ordered as needed.

1. Evaluations of reagents and supplies are done by testing their performance during validation.

2. Reagents and supplies will be re-evaluated on an on-going basis through the use of controls and intermediate checks. Further information can be found in LP.32 and LP.18.

3. As needed to monitor a particular product, an initial control may be run when a new order is received. For example, a new Wetwop may be tested once opened in addition to the control required with every use.

II. Ordering
A. The requirements for externally provided supplies will be communicated to the vendor through purchasing documents. This may include the item description, catalog #, and any specifications the Unit requires of the product.

B. An individual with budget authority, typically the Chief or a Forensic Manager, will authorize the purchase of supplies and services.

C. Personnel within the Latent Unit may order supplies according to FSD.30 & CLER.CRIM.12.

III. Receiving

A. When supplies are received, the shipping documents must be reviewed and the items inspected to verify that all supplies ordered were received and conform to the Unit's requirements. This is typically done by the analyst who placed the order.

B. Any staff member in the Latent Unit may review the order.

C. If the order does not conform to the Unit's requirements or the correct product was not received, the Unit will not accept the order. The Unit Supervisor or Technical Lead will be notified, and action will be taken.

D. Once the order is reviewed and accepted, the packaging slip should be signed/dated and forwarded to the Clerical Unit. For labeling requirements refer to LP.32 and LP.18.

E. Supplies that may affect the quality of a test include the chemicals and equipment indicated below, as well as the equipment listed in LP.18.

IV. Quality Assurance

A. All commercial kits and in-house reagents are quality control tested prior to use in casework.

B. All records are maintained in the Latent Unit (Maintenance or Reagent binders). Including calibrations, reagent preparations, and other supply information or certificates.

V. Vendors

A. The Latent Unit approved vendors for supplies and reagents that affect the quality of tests include the following:

B. A complete list of chemicals may be found within the SDS binder in the Latent Unit.

C. Proprietary preparations by the same name containing the same or similar chemicals are typically suitable.

D. Chemicals of any grade are typically suitable and may include the following commonly used supplies:

   1. Acetonitrile
      Ardrox
      Cyanoacrylate
      Ethanol
      Formic Acid
Glacial Acetic Acid
Hexane
1,2-Indanedione
Maleic Acid
Methanol
7-(p-Methoxybenzylamino)-4-Nitrobenz-2-oxa-1,3-Diazole (MBD)
Naphthol Blue Black (Amido Black)
Ninhydrin
Physical Developer
Rhodamine 6G
RTX
Sodium Carbonate
Wet Print Re-Fill (black/white)
Wetwop (black/white)
Hungarian Red

END OF DOCUMENT
I. The addition of heat and humidity may accelerate or enhance the development process of porous items. The CARON Heat and Humidity Chamber may be utilized to process chemically treated items for latent prints.

A. Instructions

1. The instructions should be read prior to use to ensure the equipment is utilized properly; refer to the instruction manual INSLP.21 Heat and Humidity Chamber.

2. Turn on the chamber using the on/off switch.

3. Set the chamber temperature and humidity controls to appropriate set points; see Chemical Techniques below for the set points for the technique being used.

4. Once set points are reached, open the chamber and put the evidence inside using clips to hang or place items on the shelf.
   a. Note: The chamber may not reach set points again once door is closed in the allotted development time.

5. Start timer
   a. Note: The timer does not shut off the heat or humidity in the chamber automatically; the analyst turn the chamber off.

6. Remove items
   a. SAFETY: The chamber can become extremely hot and caution should be used when opening the door after use. Heat resistant gloves should be worn when handling any internal components after use.

7. If applicable, wipe down any excess water that may have accumulated from using humidity.
   a. Note: It is suggested to leave the door open after use to allow water to evaporate.

B. Maintenance

1. The maintenance policy dictates periodic and annual maintenance to ensure the equipment is functioning properly; refer to (LP.18) and log (LPF.13).
2. The chamber has a water light indicator for low water in the reservoir; see INSLP.21 Heat and Humidity Chamber for instructions on refilling the water reservoir.

C. Quality Assurance

1. A test strip must be used for performance checking any reagent being used in conjunction with the chamber, and placed in the chamber along with the items of evidence.

D. Chemical Techniques

1. **Ninhydrin** is a chemical technique that can be used in conjunction with the CARON Heat and Humidity Chamber.
   a. The set points for Ninhydrin are: 85ºC and 65%RH.
   b. The appropriate time for items treated with Ninhydrin is 3 minutes inside the chamber.
   c. When practical, items treated with Ninhydrin will be allowed to continue to develop outside of the chamber for at least 3 days. See (LP.40) for more information on using Ninhydrin.

2. **1,2-Indanedione** is a chemical technique that can be used in conjunction with the CARON Heat and Humidity Chamber.
   a. The set points for 1,2-Indanedione are: 100ºC and 0%RH.
   b. The appropriate time for items treated with 1,2-Indanedione is 10 minutes inside the chamber.
   c. See LP.71 for more information.

END OF DOCUMENT
I. A variety of magnification tools are available to analysts in the Latent Unit for enhanced visualization of latent prints.

A. The magnification tools are located within the Latent Unit.

B. Unless otherwise stated, calibrations and intermediate checks are not required for this equipment.

II. Microscope: A stereo (comparison) microscope is used for comparing two side-by-side prints.

A. Set-up and Use

1. Always set the microscope on a stable surface.

2. When moving the microscope always keep one hand under the base for support and one hand on the neck for balance and stability.

3. Place microscope in a comfortable position and turn on the reflected light illuminator.

4. Put a latent print onto the stage plate.

5. Turn the zoom dial to low power and bring the image into focus.

6. Adjust the eyepieces for the correct interpupillary distance. Do this by bringing the eyepieces closer together or farther apart until a single field of view is observed.

7. Set the diopter adjustment rings on both eyepieces to the zero position.

8. Use the zoom control to set the highest magnification.

9. Bring the image into focus with the focus control. It is best to center the image on some clear point of detail.

10. Zoom the microscope down to the lowest magnification (this may cause the image to be slightly out of focus).

11. Adjust the focus for each eye separately using the eyepiece diopter adjustment rings. Do not adjust the focus with the focus knob.

12. The microscope is now "parfocal." This means that as the microscope is zoomed from high to low magnification and the image will stay in focus throughout the entire range.
13. Place the known and latent prints to be examined onto the stage. Focus as needed.

B. Cleaning and Maintenance
   1. Use canned air to blow dust off the eyepieces, the stage, and the objectives.
   2. Wiping while these parts are still dusty can scratch the surfaces, especially on the lenses of the objectives and the eyepieces.
   3. Use a Kimwipe (or other non-abrasive wipe) to clean the objectives and eyepieces.
   4. If parts are particularly dirty, cleanse with a small amount of mild cleaner and a soft cloth.
   5. When not in use, the microscope should be covered with a dust cover.

C. Maintenance
   1. See LP.18 for maintenance information. Use the Microscope Maintenance Log (LPF.06) located at the workstation near each microscope for maintenance records.

III. Magnifying Glass
   A. A variety of magnifying glasses are available to analysts for latent visualization use.
   B. Most glasses, palm and finger size, have at least 4X magnification.
      1. The fiber optic taper has 6X magnification.
   C. Cleaning and Maintenance
      1. Use a Kimwipe (or other non-abrasive wipe) to clean the eyepiece if needed.
      2. If parts of the glass are particularly dirty, cleanse with a small amount of mild cleaner and a soft cloth.

IV. Comparator
   A. Side-by-side optical projection, up to 10X magnification, used to assist in comparisons. The comparator works best in a darkened room.
   B. Cleaning and Maintenance
      1. Use a Kimwipe (or other non-abrasive wipe) to clean the comparator screens if needed.
      2. Use the Comparator log if needed to document maintenance LPF.09

V. Ridge Pro Plus Digital Magnifier
   A. Ridge Pro Plus is a battery operated digital magnifier offering up to 12X magnification.
   B. Cleaning and Maintenance
      1. See LP.18 for maintenance information.
      2. Use a Kimwipe (or other non-abrasive wipe) to clean the magnifier if needed.
      3. Use the Ridge Pro Plus Digital Magnifier log if needed to document maintenance LPF.46
END OF DOCUMENT
I. Introduction

A. Casting material available in the Latent Unit: Mikrosil and AccuTrans.

1. Casting materials are available for lifting latent prints from smooth, textured, or rough surfaces. However, are most commonly used to collect ridge detail developed with powder on surfaces that are difficult to lift with traditional lifting tapes.

2. Castings may be particularly useful to collect friction ridge detail from deceased hands or feet submitted to the laboratory. Such as, hardened, mummified, or burned skin.

3. Casting materials are not reagents, but rather are a method of collection.

4. AccuTrans and Mikrosil are available in a variety of colors, but white and black are most commonly used.
   a. Use Black when dusting with light colored powders such as white, gray, and most fluorescent powders.
   b. Use White when dusting with dark or black colored powders.

5. Casting materials may be useful in the collection of plastic prints.

6. Once dried, castings may be photographed, powdered then photographed, or scanned for examination and retention.
   a. Note: the print may need to be reversed (mirror image) for comparison purposes.

7. Expiration dates are typically found on the cartridges, tubes, or somewhere within the product kits.
   a. If the casting material is hardening or not working properly, it will be discarded even if the expiration date has not yet been reached.
   b. Unopened casting materials typically have a shelf-life of about 2-3 years.

II. Safety

A. While casting materials are generally safe to handle, avoid eye contact and ingestion.

1. If eye contact occurs, flush with water for at least 15 minutes.

B. Wear appropriate protective equipment when using (gloves, lab coat, safety goggles).
C. Refer to SDS for more safety information.

III. Mikrosil Procedure
A. The traditional product kit consists of a larger tube of Mikrosil (typically brown, grey, black, white, or transparent) and a smaller tube of the catalyst. Kits typically also contain cards and wooden spatulas.
B. Take the following steps:
   1. If powder is being used to develop prints on a surface, do that first.
   2. Squeeze out a 1.5” to 2” length of base material (Mikrosil) and a slightly shorter strip of catalyst side by side on a card. The base material will be wider than the catalyst.
   3. Using one of the wooden mixing spatulas, mix the two components together thoroughly on the card for about 20-30 seconds or until the base material absorbs the catalyst color and there are no spots or streaks.
      a. Note: Longer mixing times may result in the material setting too quickly.
   4. Apply the casting material to the surface one of two ways:
      a. With the casting material still on the mixing surface (card), press the material against the area with developed prints.
      b. Use the wooden spatula to scrape off the material from the card and apply it to the area being collected.
   5. After allowing sufficient set time (10 minutes or until hardened), carefully peel the casting away.

IV. AccuTrans Procedure
A. All necessary components should be provided in the kit.
B. Load the Dispenser:
   1. Push the release lever upward and at the same time pull back the slide-bar.
   2. Insert the cartridge downward into the dispenser's guiding grooves with the notch and close the locking flap.
   3. Push the slide-bar to the front until there is resistance.
   4. Remove the cover cap from the cartridge.
   5. Place the mixing tip onto the cartridge opening (following the guide) and fasten with a quarter clock-wise rotation.
C. Take the following steps:
   1. If powder is being used to develop prints on a surface, do that first.
   2. Steadily press the dispenser's trigger and casting material will come out (already mixed together). Continue applying the mixture until the area to be collected is fully covered.
   3. Once the material has been dispensed, use a spatula to spread the material in one direction to smooth the surface.
a. Tip: The spatula will stick and harden to the curing material and may provide a handle to assist in cast removal.

4. Allow material to harden (3-6 minutes) before removal.

5. Leave the mixing tip in place until next use (like a cap) or replace the cap onto the cartridge for storage.

END OF DOCUMENT
1. **POLICY:** QA actions are the central components for maintenance and improvements of the quality management system, and are used to track quality related issues. The level of action taken for any non-conformity is dependent on the type and severity of the incident or problem, and whether the non-conformity is isolated or repetitive.

   **A. General Information:** QA Action-Correction (QAC) is action taken to correct non-conforming work that has already occurred. The action taken to correct the non-conformity is based on the severity of the problem or occurrence. Non-conforming work refers to any aspect of the latent unit's work, both technical or administrative, that does not conform to unit policies, procedures, or agreed upon expectations of customers. Examples of non-conforming work and their corresponding level of QA action-correction are described below. For more information on non-conforming work and other forms of QA Actions, see FSD.15.

   1. **QAC-1 (Most Significant):** Action taken to address a significant technical or quality issue. Discrepancies or incidents that raise concern regarding the overall quality of the unit's work product, or the competency of an examiner. These non-conformities rise to the level of significant concern for the quality system, or a systemic problem within the unit. Documentation of the corrective action is described in Division Policy. See FSD.15, QA.18, FSDF.06, FSD.44 for more information about the evaluation of significance, required elements, documentation, and retention of corrective action records.

      a. Examples include:

         i. Reported erroneous tests, results, or conclusions.

         ii. Unreported test (work).

         iii. Erroneous testimony.

         iv. Unsuccessful proficiency or competency test.

         v. Misuse of reagents, methods, and equipment that had a deleterious impact on the evidence.

         vi. Audit findings.

         vii. Repeated QAC-2 non-conformities.

         viii. Use of erroneous exemplars resulting in reported erroneous conclusion(s).
ix. Erroneous identification: An *Identification* deemed to be an *Exclusion* during the Verification process.

2. **QAC-2:** Action taken to correct a non-conformity when the non-conforming work is of *some significance* and the investigation demonstrates that the validity and accuracy of the test result was not affected. Discrepancies or incidents not serious enough to cause immediate concern for the quality system or the unit's overall work, but do have an isolated affect on the work product. These non-conformities are typically detected during technical review and corrected prior to the release of results. QAC-2 incidents are documented on a *Division Level-2 Correction Form* and maintained in LIMS (FSDF.23). A copy or related documentation may also be maintained in the unit. Examples of QAC-2 (Level-2) incidents may include:

   a. Improper use of controls, reagents, methods, or equipment; **however, the validity of the result and quality of the work is demonstrated to not be impacted:**
   
      i. Use of expired reagents.
   
      ii. Misuse of a control; use of the wrong reagent control.
   
      iii. Not following proper processing methods or processing sequences.
   
      iv. Use of equipment that was not properly checked or calibrated.

   b. Not following unit procedures for instrument, equipment, or computer software (policy drift).

   c. Not handling evidence or packaging properly.

   d. Non-consensus decisions and conclusions upon review (verification or technical review):

      i. Erroneous exclusion: An *Exclusion* is deemed to be an *Identification* during the verification or other review process.

      ii. An *Identification* or *Exclusion* is deemed to be *Inconclusive* during the verification process.

      iii. Conflict resolution: blind verification used for conflict resolution regarding a conclusion.

   e. ABIS quality: non-consensus determination of suitability.

      i. Following a "full-screening," if analysts are unable to reach a consensus regarding the ABIS quality of a print.

   f. Equipment malfunction.

   g. Repeated QAC-3 errors.

3. **QAC-3 (Least Significant):** Action taken to correct a non-conformity when the significance of the non-conforming work is *minimal*. The correction is readily apparent and can be made quickly with little to no documentation required. These errors are typically found during the review process. Examples include:

   a. Transcription errors.

      i. Quality log indicates the LEFT thumb, but the RIGHT thumb of a subject was identified.
ii. Switching the month and day when documenting the lot # of a reagent.

b. Grammatical or typographical errors.

c. Spelling or grammar mistakes.

d. Wrong agency case number or requester in LIMS.

e. Omission errors.
   i. Issuing a report without stating that exemplars were not located for an elimination subject.
   ii. Leaving out of the notes which camera was used to document developed latent prints.

f. This type of non-conformity is typically corrected by the analyst. See Division Policy FSD.42 and FSD.43.

B. Documentation of all QAC-1 and QAC-2 non-conformities are evaluated by the Unit Supervisor.

C. Documentation of QAC-2 non-conformities are maintained within the Latent Unit and are available for review.

D. QA Actions do not address personnel issues and are not considered personnel actions.

END OF DOCUMENT
I. Competency Tests: regardless of prior training and experience, all analysts will complete a competency test prior to doing casework in an area of testing (Comparisons, Processing, and ABIS).

A. Purpose
   1. The purpose of a competency test is to assess an analyst's specialized knowledge, skills and abilities.
   2. Competency tests are intended to challenge individual performance.

B. Scope of Testing
   1. The scope of the competency test will be tailored to the analyst's job duties and to the extent they will do casework.
   2. The analyst's competency test will include:
      a. Examination of samples (practical exam).
      b. Completion of a written examination to assess the analyst's knowledge of the particular area of testing and testing procedures (written exam).
      c. A LIMS generated report to demonstrate the analyst's ability to properly convey results and/or conclusions following unit policy guidelines. See LP.16
      d. Court-like questions and/or Mock trial (oral exam).
      e. See LP.53 for more information on latent competency tests.
   3. A competency test may be required for existing Forensic Services Division staff if new methodologies and/or equipment have been introduced.

C. Authorizations
   1. Upon authorization, the analyst is deemed to be authorized to use all equipment, instrumentation and procedures to the extent they received training and were competency tested.
   2. The analyst is additionally considered to be authorized to issue reports and give opinions and interpretations in the area(s) for which training and competency has been documented.
   3. Documentation of the analyst's competency test will be maintained in LIMS according to procedures detailed in QA.10. Staff authorizations will be maintained
by the Latent Unit Supervisor.

4. See LP.53 for a list of latent authorizations.

D. For more information about competency testing and authorizations, see FSD.21.

II. Proficiency Tests: All case-working analysts will complete at least one proficiency test per calendar year commencing the year following their competency test.

A. Purpose

1. Proficiency testing is an element of the Latent Print Unit's quality assurance program to ensure analysts maintain their skill set in the areas they perform work.

2. Where available and appropriate, external tests used by the Latent Unit will be from a proficiency test provider that is accredited to ISO/IEC 17043. If such a test provider is no longer available for external tests, the laboratory will gain approval from ANAB for alternative means by which the unit's performance can be assessed.

B. Schedule of Testing

1. The Unit Supervisor will maintain a schedule of proficiency testing for all Latent Print Unit staff who conduct casework. The schedule (plan) will take into account past, current and future unit casework assignments for the calendar year, as well as ensure the inclusion of a representative sample of tests within Friction Ridge Examination on the scope of accreditation.

   a. The manufacturer's Due Date is routinely used to track and schedule external proficiency tests.

      i. Tests created internally will also be given a Due Date for completion.

2. The Unit Supervisor is responsible for taking steps (as needed) to ensure that the analyst is not aware of the expected answers when a proficiency test is shared or reused.

3. Every analyst performing comparison casework (or verifications/technical review) will take a comparison proficiency test each calendar year, preferably provided by an external source.

   a. At least one external comparison proficiency test per unit will be reported to the accrediting body each year, however all external tests should be reported.

4. Every analyst performing ABIS casework will take an ABIS proficiency test at least once every 4 calendar years. This test will likely be created internally.

5. Every analyst performing processing casework will take a processing proficiency test at least once every 4 calendar years. This test may be created internally or externally.

6. Proficiency testing is required prior to returning to casework after an absence of greater than 12 months.

7. The Section Manager or Latent Unit Supervisor may initiate proficiency tests for any analyst in their section at any time. The Chief may initiate proficiency tests for any analyst in the Division at any time.

8. See FSD.23 for more information about the responsibilities of scheduling and assigning proficiency tests.
C. **Scope of Testing**

1. The proficiency tests are intended to monitor work as normally performed in the laboratory and are conducted using the currently approved procedures.

2. Work is done independently by the analyst, supported by notes and other documentation and released in a written report.

3. Prior to reporting the proficiency test results, work is to receive the same level of verification, technical review and administrative review as required for casework.

4. For external tests, results must be submitted to the proficiency test provider in order to be included in the provider's published external summary report prior to the manufacturer's due date.

D. **Documenting and Retaining Proficiency Test Records**

1. See FSD.23 for information regarding documentation specifications and retention of test records.

III. **Determining Satisfactory or Unsatisfactory Competency/Proficiency Tests**

A. For a test to be deemed Satisfactory:

1. **Latent Comparison Test**
   a. All conclusions (Identifications and Exclusions) will be reported correctly.
   b. While comparison tests are not designed to result in *inconclusive* or *insufficient*, if an analyst reports this decision, the result must be qualified and supported according to the unit policy guidelines. This conclusion may result in not passing the test if it lacks support/documentation and may not be reported more than once per test. For conclusion guidelines, see LP.19.

2. **Latent Processing Test**
   a. All test items are processed using the correct chemical and/or physical techniques and sequencing procedures, and prints develop in appropriate areas/quadrants as intended by the test maker.
   b. Developed latent prints are appropriately captured (photographed or lifted).

3. **Latent ABIS Test**
   a. Latent samples known to correspond with individuals registered to the database will *Hit* when searched in CAFIS and/or ULW by the analyst.

B. Administrative error discrepancies (clerical, sample confusion, improper storage or transfer, insufficient documentation etc.) may be addressed by counseling, remedial training, or other as deemed necessary by the Unit Supervisor and/or Technical Lead, but do not alone lead to an unsatisfactory test.

C. The quality (how test was created & expected results) of an internal test will be ensured prior to issuing the test. The quality of an external test will be established by the test provider/vendor.

D. The examiner will be informed of the criteria for successful completion of a test (as specified above in this policy) via review of this policy or by other means of communication prior to issuing the test.
E. If a test is deemed Unsatisfactory, steps will be taken to address the issue(s). See FSD.15

END OF DOCUMENT
1. **Policy:** All evidence will be handled, processed, and stored in a way that will minimize the possibility of loss, degradation, contamination and deleterious change.

   A. The following are measures that will be taken in the Laboratory to ensure good housekeeping and evidence handling while processing evidence for latent prints.

      1. The processing rooms will have limited access.

         a. When evidence is out, the access will be further limited to staff directly working or consulting on the exposed evidence.

      2. **Staff processing items for latent prints will treat items as if DNA analysis may be needed at a later time.**

      3. A mask will be worn by everyone upon entering the processing room(s) when evidence is out or in progress.

      4. Re-hydrating latent residues by "huffing" with the mouth will **not be practiced,** therefore, if necessary another form of re-hydration must be used (e.g. use of steam from an iron with sterile water).

      5. Prior to removing evidence from it's packaging for latent processing, staff processing the evidence will:

         a. Bleach/disinfect the work space

         b. Bleach/disinfect the equipment and tools to be used (pens, keyboard, trays, shelving, beakers, magnifying glass, or any other items with potential to make contact with the evidence or the examiner's gloves).

         c. Cover the work space with clean butcher paper. The surface area/work space **must** have a new clean butcher paper prior to swabbing for potential DNA.

         d. Apply new gloves

         e. Use a mask

         f. Use a hairnet

      6. Once evidence has been removed from the packaging, the evidence and packaging will be on separate work areas to avoid contamination from the packaging.

         a. Staff will use designated "dirty" counter space areas for packaging to ensure it is separated from "clean" butcher paper covered counter top work areas for
evidence processing.

b. Staff will not touch the materials needed for swabbing with ungloved hands. Materials include: soil envelopes, swab packages, water ampules, pens, etc.

c. Gloves will be changed or bleached/disinfected regularly and often to prevent contamination and cross-contamination of evidence.

d. Items will remain in their packaging until needed for processing, preferably stored in the Evidence Storage Area.

e. The number of evidence items/cases out and open at one time should be minimized whenever possible. It is understood that some cases may be processed at the same time for efficiency (batching).

B. All "IN Progress" evidence should be kept closed or covered with butcher paper when not in use (if not sealed) to prevent loss of contents and/or contamination.

1. Refer to LP09 for additional Evidence Handling procedures.

END OF DOCUMENT
Photoshop is primarily used to document observations during ACE-V, to annotate digital images, and for the preparation of displays (court etc.). Image enhancements include any process that changes the brightness or color of any area of an image for the purpose of increasing visibility. Enhancements do not include changes to images that do not alter the content or do not increase visibility (for example, cropping, rotating, labeling, and converting file types). Other more advanced applications and uses of Photoshop must be approved by the Supervisor or Technical Lead prior to being used in casework. The Latent Unit will maintain a list of approved equipment, including Photoshop software, which will also include the current version in use.

A. The following examples are common uses of Photoshop and do not require step-by-step documentation.
   1. Cropping or rotating
   2. Marking 1st, 2nd, 3rd levels of detail, and documenting the presence of distortion, overlays, or other analysis observations
   3. Labeling

B. Detailed notes including screen shots (when applicable) of the enhancement changes, or a copy of the metadata, will be included in the technical record when enhancements are made in Photoshop. Enhancements will be made to a working copy only. The following Photoshop enhancements will be documented in the technical record:
   1. Levels and Curves, or other contrast/brightness adjustments
   2. Inverting or changing the color appearance of an image
   3. Scaling images to 1000 dpi, as needed for ULW search (See LP.28)

C. The following are examples of more advanced uses of Photoshop and require Supervisor or Technical Lead approval prior to use in casework:
   1. Dropping out background colors or patterns (for example, red and blue on a Pepsi can or the background pattern on a check to visualize a print more clearly).
   2. Putting multiple images together for better visualization of a single print (for example, different processing techniques to develop the same print or multiple photos on a round surface).

D. Photoshop software is available to all personnel in the Latent Unit.

E. Planned maintenance and intermediate checks are not necessary to ensure the performance of this equipment; however, major software updates will require a performance
verifying.

II. History Log

A. The history log must be turned on prior to processing digital images. This will allow for the tracking of all processing performed on the image. If processing of the image requires applications of Photoshop beyond what is commonly used in casework (above), the history log (metadata) will be maintained and detailed notes must be included.

B. To ensure the History Log is on, select Ctrl K (Preferences, History Log) and the metadata box will be selected (Detailed in drop down).

III. Images acquired from digital cameras and scanners must be calibrated when 1:1 life size output is necessary for printing.

A. Instructions for calibrating an image 1:1

1. Filter>Distort>Lens Correction
2. Click on Straighten Tool in the upper left
3. Click and drag a straight line in the photo (using the scale in photo)
4. Click on "Show Grid" to check if scale is straight
5. Crop the image (latent) to a known distance (using ruler)
6. Image>Image Size
7. Uncheck "Resample Image"
8. Change the dimension to the proper system (imperial or metric)
9. Enter the known distance
10. Copy the number resolution box and click Cancel
11. Undo the crop (Edit>undo crop) and photo should return to original state
12. Image>Image Size
13. Make sure the Resample Image box is Unchecked
14. Highlight the number in the Resolution box and paste in the resolution value from step 10 above
15. The image won't look different, but when printed the scaled size will be 1:1

IV. Court Displays (Note: The final display will be reviewed by the Unit Supervisor or Technical Lead prior to its use in court)

A. Images may need to be calibrated or rescaled. Instructions may be found in the User Guide.

B. In order to obtain the best image quality when printing the final exhibit, ensure images are acquired at the highest resolution (1000 or 1200 dpi).

V. References: the following are available for further instructions on Photoshop:

A. Adobe Photoshop CC Classroom in a Book (2017 edition and any updated releases as needed).

B. https://helpx.adobe.com/photoshop/tutorials.html
I. General Information

A. Major case prints are exemplars of all the friction ridge detail on the hands or feet.

B. Major case prints may also include special exemplars of friction ridge detail not typically obtained through traditional collection techniques.

C. If special exemplars are requested by an agency, or needed by an analyst to complete an examination, arrangements should be made with the Records & Identification Unit to have them collected.

D. Collection of major case prints typically will occur at the jail or at the morgue.
   1. If an analyst is required to collect the exemplars outside of the lab, the task must fall under crime scene services. Refer to crime scene manual for further information.
   2. Tips for collection:
      a. For a live person, instruct the individual to look away during the collection so not to assist in the process and to relax.
      b. At times an individual may have thin or worn ridges. For the collection to be more successful, apply light pressure and use very little ink or powder.
      c. A technique known as "milking the finger" can be used to raise the fingerprint ridges prior to collection. This technique involves applying pressure or rubbing the fingers in a downward motion from palm to fingertip.
      d. It may also be helpful to apply lotion.

II. Methods of Collection: Deceased

A. Photography
   1. In most cases, photography will be the first method of collection attempted as subsequent collection methods may cause damage to the friction ridge skin.
   2. Images of friction ridge skin are treated as evidence submissions in LIMS.
   3. Ensure camera is set to RAW and include a scale prior to capturing images.

B. Mummified Friction Ridges
   1. Hands and feet in a mummified state are extremely hard due to lack of moisture in the body.
2. Photography may be the best option of collection.

3. **Mikrosil or Accutrans** are also available. This method will record ridge detail in areas that may not be smooth and flat (e.g., wrinkled fingers). The casting material is minimally invasive and should not destroy the friction ridge skin as long as the skin is still securely attached to the hands or feet. For more information see LP.57.

4. **Downy Softener Method**: If the above methods did not provide usable friction ridge detail, the Downy Softener method may be utilized. This will require having the fingers removed from the hand and submitted as evidence from the Coroner's Office. Individual fingers are easier to rehydrate than when attached to the rest of the hand; however, if there is lack of clear ridge detail on the fingers, or major case prints are needed, this method may also be used on the palms and feet. Caution must be taken as some areas of skin may become overly hydrated and can tear.
   
   a. Mix 20g of Salt (approximately 1 tablespoon) with 25ml of Downy Softener and 25ml of tap water in a bottle or beaker. Shake all contents until mixed together well.
   
   b. Pour mixture into a container large enough to hold the friction ridge surface (finger, hand, foot).
   
   c. Use caution to keep each body part separate and properly labeled; multiple fingers should be kept in separate tubes.
   
   d. Soak the friction ridge area(s) in the solution while monitoring the hydration progress to determine when the skin becomes sufficient for analysis.
   
   e. Remove from solution when ridges appear sufficiently hydrated and allow to dry.
   
   f. Photograph the friction ridge surface area first, or brush with powder and lift with handiprint to collect exemplar prints.

5. **Boiling Method**: This should be attempted only when nothing else has softened the skin sufficiently.
   
   a. Using a hot plate, boil a beaker full of water.
   
   b. Once the water is boiling, remove the source of heat (unplug the hot plate) and deposit the friction ridge skin into the water.
   
   c. Allow the skin to boil for 5-10 seconds, then observe the friction ridge detail for softening. If the skin is not sufficiently soft, the boiling method may be repeated twice more. It is recommended that this method be attempted no more than three times because prolonged exposure to high heat can damage the skin.

C. **Soaked Friction Ridges**

1. A deceased person found in a body of water or having been exposed to elements such as rain for an extended period of time, may have extremely wet or damaged friction ridge detail making the skin susceptible to tearing or "degloving." Degloving refers to the skin separating from the rest of the hand and sometimes will have the appearance of a glove. Extreme caution should be used to not further damage any detail available on the detached skin. The following are recommended techniques for obtaining a recording of this type of friction ridge detail.
a. **Dry the skin:** Attempting to dry the area of friction ridge skin that will need to be recorded will make the processing methods more successful. Using towels, gently dry the skin being cautious not to cause damage or tearing.

b. **Photography:** May be the best option for capturing delicate ridge detail.

c. **Powder and Handiprint:** Apply black powder to the friction ridge skin area and carefully lift the detail using Handiprint. The skin may need to continually be dried during this process.

d. **Rolling the Skin with Ink or Powder:** If the skin has been "degloved," slip the dried skin over your gloved hand. Apply a small amount of ink or powder and print as if it were your own hand.

e. **Photographing the Internal Skin Layers:** If there is no usable friction ridge detail visible on the epidermal layer, obtaining the detail from the dermal layer of skin may be appropriate.
   
   i. Note: when analyzing the detail, the print would be vertically flipped; a mirror image.

D. **Burned Friction Ridges** The methods for obtaining a recording of the friction ridge detail from a burned victim are very similar to the method from wet friction ridges. See procedures listed above.

   1. Extreme caution should be used as to not further damage any detail available. Prior to collection, attempt to clean off any soot and debris present on the skin.

E. **Severe Decomposition** A deceased person may have undergone severe decomposition in which the tissue has decomposed enough that there is little skin left on the hands and feet. Additionally, the tissue may be very soft. Extreme caution should be used to not damage any detail available. **Photography** may be the best option for capturing this delicate ridge detail.

III. **Methods of Collection: Live**

A. **Photography** (See above)

B. **Handiprint with Powder**

   1. Handiprint is a flexible plastic with an exceptionally smooth adhesive coating. It has distinct advantages for friction ridge skin collection over other methods because it conforms to the curves of the hands and feet.

   2. Lightly dust the entire surface of the palm or foot with black fingerprint powder.

   3. Separate the release paper from the Handiprint lift sheet and press the adhesive side onto the hand or foot in one continuous motion.

   4. Firmly press in the voided areas (typically in the center) using caution not to lift up the hand or foot then place back down onto the sheet (causing overlapping impressions).

   5. Cover the hands and fingers or feet and toes including around the sides with the Handiprint, collecting as much of a complete sample as possible.

   6. Gently pull the Handiprint off of the skin and apply a piece of clear plastic (acetate sheet) over the adhesive side.
7. Additional attempts may be necessary to ensure all areas of friction ridge skin have been clearly collected.

8. Handprint comes in different sizes and may require being cut into smaller pieces, particularly for printing individual fingers or toes.

C. Ink on Fingerprint Card

1. Ink printing is typically used if it is the only available resource at the time of collection.

2. The hands or feet should be cleaned prior to printing.

3. Roll the finger on the inking plate or pad so the entire fingerprint pattern area is evenly covered with ink.

4. The ink should cover from one edge of the nail to the other and from the crease of the first joint to the tip of the finger.
   a. Using the correct amount of ink is vital.

5. When taking the rolled impression, the side of the finger bulb is placed upon the card. The finger is then rolled to the other side until it faces the opposite direction.

6. Care should be exercised so the bulb of each finger, from tip to below the first joint, is rolled evenly. Generally, the weight of the finger is the maximum pressure needed to clearly record a fingerprint.

7. In order to take advantage of the natural movement of the forearm, the hand should be rotated from the more difficult position to the easiest position.

8. This requires the thumbs be rolled toward and the fingers, away from the center of the individual's body.

9. Take care to lift each finger up after rolling to avoid smudging.

10. Palms and feet are captured similarly to fingers. Apply ink to all areas of the friction ridge skin and press down on the card. Be sure to include pressure in the center areas to ensure contact of the skin with the card.

END OF DOCUMENT
I. Policy: All new methods, procedures, software, or equipment must be validated or performance checked before use in casework.

A. Introduction

1. New methods, procedures, software, or equipment, including most adjustments or changes to current procedures, must be tested to ensure that the change or improvement is fit-for-purpose. Approval of the method for use in casework is documentation that the method is fit for the intended use. The validation or performance verification will be as extensive as necessary to meet the needs of the given application.

2. See FSD.27 for the necessary components, information, and requirements of Method Development, Method Validation, Performance Verification, and Deviation from Approved Methods.

B. Plan: Prior to starting the validation, a plan will be documented and approved. The plan will be documented using FSDF.20 and includes:

1. Description of the method
2. Scope of Validation
3. Type of samples to be tested and intended use in casework
4. Time frame for validation
5. Personnel involved in and responsible for the validation
6. Performance characteristics to be evaluated and the criteria for acceptance
7. Limitations of the method and the impact on reported results, opinions, and interpretations
8. Under what conditions additional validation is required
9. Safety considerations
10. Data required to report a test result, opinion, or interpretation and the process for data interpretation
11. Assessment of training, competency, authorization and policy updates

C. Roles and Responsibilities
1. The Manager or Latent Unit Supervisor is responsible for submitting the validation plan to the QA coordinator and completing the QA Action documentation (See FSD.15).
2. The latent unit technical lead is responsible for reviewing and approving all latent validations.
3. The QA coordinator is responsible for reviewing validation plans prior to start, and reviewing validation documentation prior to implementation of new methods.
4. See FSD.27 and LP.72 for more details on roles and responsibilities.

D. Performance Verification
1. A performance verification is a check of the reliability of a previously validated method, procedure, software, or equipment by demonstrating through objective evidence that the performance characteristics of the item have been met.
2. A performance verification is less extensive than a validation.
3. A performance verification may be performed when minor modifications to an existing method, procedure, or software are made.
4. The Latent Unit Supervisor and Technical Lead are responsible for determining when the change is significant enough to require a full validation.
5. A performance verification may be as extensive as necessary to document fitness for purpose and may include, but is not limited to:
   a. Comparison to other methods currently in use.
   b. Demonstration that the method or equipment yields the expected result.
   c. Assessment of factors influencing the result.

E. Method Validation
1. A validation is a documented process of performing a set of experiments which establish the efficacy and reliability of a technique or procedure, or modification thereof. A validation must have a set of particular requirements specific for the intended use of the method and demonstrate through objective evidence that those requirements are fulfilled.
2. Scientific Working Group (SWGFAST) and OSAC (Friction Ridge Subcommittee) documents are resources the latent unit may choose to rely on to determine the scope and extent of a validation.
3. Validation studies may be as extensive as necessary to demonstrate fitness for purpose.

4. **For further details on writing method procedures and validation study recommendations, see FSD.27.**

F. **Software**

1. When computers or automated equipment are used for the acquisition, processing, recording, reporting, storage or retrieval of test data, the laboratory will ensure that laboratory configured software is suitably validated and documented as being adequate for use.

2. Commercial off-the shelf software used within its designed application range will be considered to be sufficiently validated.

3. Records will be maintained of software significant to the result and shall, when possible, be uniquely identified.

4. See FSD.34 for more information on control of software and data.

END OF DOCUMENT
I. The Latent Unit Staff shall comply with all reasonable and legitimate Discovery Requests. See FSD.45 for more information on discoveries.

A. Discovery requests are routed to the Forensic Services Division via the District Attorney's Office.
   1. These requests typically pertain to documents related to analysis or records kept in the normal course of Laboratory business.
   2. The District Attorney's office should review the discoveries for relevance, before sending the request to the laboratory.
   3. If the discovery information sought appears to be unreasonable or irrelevant, a Supervisor or staff member assigned the discovery may contact the District Attorney's office for assistance in clarifying or modifying the request, obtaining a new request or quashing the discovery.
   4. Any "RUSH" discoveries may need to be provided as paper or faxed copy. The "RUSH" discoveries need to be approved by the Supervisor to assess the exigency of the circumstances (FSD.45).

B. Discovery Procedures
   1. The Clerical staff will create a discovery request in LIMS and should image the request, report with notes, and chain of custody.
      a. The "Latent Discovery" service under the Latent Unit should be used.
      b. The analyst who completed the analysis will typically be assigned the discovery.
   2. The assigned analyst will review the discovery request and determine what information is needed.
   3. The discovery requests may be completed electronically and distributed via ARIES.
      a. The electronic files of the records requested will be gathered and uploaded into LIMS.
         i. Save images to the C-drive or desktop as opposed to a networked drive prior to uploading to LIMS.
ii. If concatenation is desired, detailed procedures on how to concatenate .pdf documents can be found in "Electronic Batch Documents (TOX.10)."

b. In the LIMS imaging module, right-click each image to be released as part of the discovery, and select "Send to iResults". A check mark will appear next to the "Send to iResults" menu.

c. The electronic discovery records will be accessible via ARIES for the District Attorney's office to retrieve. There is a 24 hour lag from the time the case has been Admin Reviewed before the records will be accessible to the DA's office.

4. **Records not able to be uploaded into LIMS will be provided to the District Attorney's Office outside of ARIES.**

   a. Discovery records may be compiled on CD, DVD or other electronic media. Multiple copies of the electronic media may be provided. These may include records not amenable to be uploaded as images e.g. pictures, raw data, very large documents etc.

5. The discovery request will be marked as "Draft Complete" by the analyst completing the discovery.

6. The completed discovery will be checked and marked "Admin Reviewed" by a Supervisor or a member of the latent unit.

7. A copy of the discovery record(s) released, will be retained (FSD.45).

END OF DOCUMENT
I. Development Technique: 1,2-Indanedione on porous items

A. Introduction

1. 1,2-Indanedione is an amino acid sensitive latent print processing reagent for porous items. This chemical reacts with the amino acids in friction ridge skin residues left behind and produces fluorescent products that render latent prints visible. Ridge detail that develops initially is a visible pale pink color, but with the use of the Coherent TracER Laser, or a blue-green light (505-570nm) from an Alternate Light Source (ALS) it will fluoresce yellow. Optimum viewing and photography is done with an orange or red filter.

2. 1,2-Indanedione treated porous surfaces can subsequently be treated with Ninhydrin. See LP.40 for more information on Ninhydrin

B. Procedure

1. 1,2-Indanedione works best on light colored porous surfaces and is not recommended for use on red, black, or dark colored items.

2. 1,2-Indanedione is not a recommended processing method for Newspaper. 
   a. Use Ninhydrin when processing newspaper.

3. When thermal paper is being processed with 1,2-Indanedione, it was established during testing that the CARON chamber should not be used due to the addition of heat having undesirable effects on the thermal paper. However, using 1,2-Indanedione provided better results than using Ninhydrin to process thermal paper for latent prints.

C. Quality Assurance and Intermediate Checks

1. Reagent will be tested when it is made and again with every use. Documentation will be on the reagent log or in the case notes.

2. A test strip will be used to ensure the 1,2-Indanedione is properly reacting to amino acids by using the Amino Acid Reference Pad, and the results will be documented in the case notes. A donor print may be used to test this reagent if an Amino Acid Reference Pad is not available. See LP.40 for more information on the Amino Acid Reference Pad
a. Pressing the rubber stamp onto the amino acid portion of the reference pad. Press the rubber stamp onto a piece of paper 3-5 times sequentially creating a test strip. The test strip will then be processed with 1,2-Indanedione following the application technique noted below.

   i. A positive reaction occurs when a visual light pink color develops (yellow color with the Laser or ALS) in the pattern of the rubber stamp used.

   ii. A negative reaction occurs when no color change appears in the area stamped with amino acid.

   iii. Should a negative reaction occur, run a second test strip using a different amino acid pad or donor.

      1. If a second negative reaction occurs, do not use the 1,2-Indanedione on evidence and notify the Supervisor or TL.

D. Application

1. Reagent is applied to porous item(s) by using a spray, wash or dip (preferred) method inside a fume hood.

   a. Ridge detail is usually clearest and most detailed when dipped in 1,2-Indanedione allowing the chemical to thoroughly and evenly disperse on the porous item.

2. Processed item(s) are air dried, permitting the carrier solvent to evaporate completely.

3. Item(s) are placed in the CARON fingerprint chamber (with the exception of thermal paper) using the following settings:

   a. 100ºC for 10 minutes. See LP.55 for the CARON chamber instructions

4. Item(s) are examined for ridge detail using the TracER Laser or ALS.

5. Developed prints that are potentially usable must be digitally captured for preservation.

6. Due to the excessive heat applied to items while using this reagent, DNA collection is not likely to be successful following this technique.

E. Sequencing

1. Application of multiple techniques targeting porous development may only occur in the following order:

   a. 1,2-Indanedione.

   b. Ninhydrin See LP.40 for more information on Ninhydrin.

   c. Physical Developer See LP.41 for more information on Physical Developer.

F. Preparation - Two options: reagent preparation in laboratory and pre-measured mixture
1. For reagent preparation at laboratory, mix (in order, using magnetic stirring device) the following together:
   a. 2 grams 1,2-Indanedione powder.
   b. 70 milliliters Ethyl Acetate.
      i. mix well before adding next step.
   c. 930 milliliters HFE-7100 (3M Novec developed substitute for Freon).
   d. Mix well then transfer to a properly labelled working solution bottle. Store solution protected from light.
   e. Record the making of the reagent on the reagent log. (See LPF.49 for more information)
   f. Reagent expires after 1 year.

2. A pre-measured mixture supplied by Tri-Tech Forensics may be used. The components are added together before use as follows:
   a. Add Part A liquid to Part B powder.
   b. Shake (in Part B container) thoroughly to mix.
   c. Pour mixed Parts A and B into Part C bottle.
   d. Shake to mix for working solution.
   e. Due to its quick expiration after mixing the components together, this working solution will be discarded immediately after use.

G. Lot Number
1. The following will be considered the lot number: Date the reagent was made plus analyst initials. (Example: 01012015 KN).
2. The lot # of the 1,2-Indanedione reagent will be recorded in the case notes.

H. Safety
1. 1,2-Indanedione may be harmful if inhaled, ingested, or absorbed by the skin. If contact is made with the eyes, there is risk of serious eye damage.
2. Where ventilation is insufficient, it is recommended to use an approved vapor respirator.
3. Gloves, goggles and lab coat must be worn while using this product.
4. Immediately wash hands after use.
5. A fume hood or full face respirator is necessary for processing items with 1,2-Indanedione.

I. References
3. 1,2 Indanedione Reagent, www.tritechforensics.com (paper that comes in the box with the chemical from Tri-Tech Forensics)

4. Sigma-Aldrich Safety Data Sheet

END OF DOCUMENT
I. Policy: Personnel in the Latent Unit will possess the education, training, and experience requisite to perform their job duties.

A. Job Descriptions

1. Job titles held within the Forensic Services Division are listed within (FSD.03).

2. County Human Resources Department maintains written job descriptions for each job title.

3. Personnel within the Latent Unit may perform specific job duties based on their job title. Their qualifications, responsibility, and/or authority in each position is described below.

B. Job Duties

1. Latent Processing

   a. Role: To identify and apply the proper latent processing techniques for the purpose of developing and/or enhancing latent prints on various types of evidence. To photograph and/or lift latent prints for further evaluation and comparison. To identify and swab areas appropriate for potential DNA testing. To prepare notes, case reports, and provide expert testimony. Additional duties may include preparation of reagents, calibration of equipment and other quality control checks, and ordering supplies.

   b. Qualifications: Staff conducting latent processing will be employees of the Sheriff’s Office and have, at a minimum, the following education, experience, and training:

      i. Education: 15 semester or 20 quarter units from an accredited college/university that must include a course in each of the following: (1) English Composition; (2) Mathematics or Statistics; (3) Chemistry, Biology, or other Physical Science (with a laboratory section).

      ii. Training/Experience: Prior experience or training (in-house or external) in latent processing techniques to include; hands-on testing in the types of procedures performed in the Latent Unit. (See LP.31). The category(s) of tests the examiner has been trained to perform will be documented on the Latent training log. (See LPTF.07)
iii. Authorization: A competency test in the category(s) of testing/processing must be successfully completed prior to authorization to conduct casework. An examiner’s authorization and their scope of authorization to conduct casework will be documented on a completed authorization form (see LPF.42) and will be maintained by the Unit Supervisor.

2. Latent Comparison
   a. Role: To recognize and classify latent prints suitable for comparison, and if determined to be suitable, compare the friction ridge detail to exemplar prints from known individuals.
   b. Qualifications: Staff conducting latent comparisons will be employees of the Laboratory and have, at a minimum, the following education, experience, and training:
      i. Meet the education requirements for a Fingerprint Examiner or the degree requirements for a Criminalist.
      ii. Meet the experience requirements of a Fingerprint Examiner or have equivalent prior experience or training (in-house or external) with the ACE-V methodology for conducting print comparisons. See LPT.08 for the scope of training required using the ACE-V methodology. The elements of comparison training will be documented on the Latent training log. (See LPTF.08)
   c. Authorization: A competency test must be successfully completed prior to authorization to conduct casework. An examiner’s authorization and their scope of authorization to conduct casework will be documented on a completed authorization form (see LPF.41) and will be maintained by the Unit Supervisor.

3. ABIS (Automated Biometric Identification System)
   a. Role: To recognize the various levels of quality and detail of latent prints and assess it's potential for ABIS entry. To properly enter and operate the friction ridge automation technology and to draw proper conclusions regarding potential candidate hits.
   b. Qualifications: Staff utilizing ABIS will be employees of the Laboratory and have, at a minimum, the following education, experience, and training:
      i. Meet the education requirements of a Fingerprint Examiner or degree requirements of a Criminalist.
      ii. Meet the experience requirements of a Fingerprint Examiner or have equivalent prior experience or training (in-house or external) with the use of ABIS. See LPT.09 for the scope of training associated with ABIS. The elements of ABIS training will be documented on the Latent training log. (See LPTF.09)
   c. Authorization: A competency test must be successfully completed prior to authorization to conduct casework. An examiner’s authorization and their scope of authorization to conduct casework will be documented on a completed authorization form (see LPF.40) and will be maintained by the Unit Supervisor.
4. Latent Screening
   a. Role: To evaluate latent prints to determine if sufficient friction ridge detail exists for a comparison or an ABIS search.
   b. Qualifications: Staff performing latent screening will be employees of the Laboratory and have, at a minimum, the following education, experience, and training:
      i. Meet the education requirements of a Fingerprint Examiner or degree requirements of a Criminalist.
      ii. Meet the experience requirements of a Fingerprint Examiner or have equivalent prior experience or training (in-house or external) with Latent Print Comparisons. See LPT.08 for the scope of training associated with the suitability of latent prints for comparison. The elements of training for screening prints will be documented on the Latent training log. (See LPTF.08).
   c. Authorization: A successfully completed competency test in latent comparison must be successfully completed prior to authorization to conduct casework. An examiner’s authorization and their scope of authorization to conduct casework will be documented on a completed authorization form (see LPF.42) and will be maintained by the Unit Supervisor.

5. Ten-Print/Latent Inquiry (T/LI) and Palm print/Latent Inquiry (P/LI)
   a. Role: To screen potential ABIS hits resulting from continuous searches of the unsolved latent database. The screening entails evaluating overall ridge detail similarities exhibited between the registered latent print and the queue of candidates.
   b. Qualifications: Staff evaluating T/LI and P/LI queues will be employees of the Contra Costa Sheriff's Office. They will have at a minimum the following education, experience, and training:
      i. Meet the education requirements of a Fingerprint Technician, Fingerprint Examiner, or degree requirements of a Criminalist.
      ii. Meet the experience requirements of a Fingerprint Technician or Fingerprint Examiner or have equivalent prior experience or training (in-house or external) with the use of ABIS. See LPT.09 for the scope of training associated with ABIS. The elements of ABIS training will be documented on the Latent training log. (See LPTF.09)
      iii. Fingerprint Technicians will not: perform a complete comparison of the candidate match, draw conclusions of a match, serve as a reviewer, prepare reports, release results to any outside agency, or testify in court regarding the screening.
   c. Authorization: A competency test must be successfully completed prior to authorization to perform ABIS screening. Staff’s authorization and their scope of authorization to conduct T/LI and P/LI screening will be documented on a completed authorization form (see LPF.40) and will be maintained by the Unit Supervisor.

6. Technical Leader
a. Roles and Responsibilities: The Technical Leader will work closely with the Unit Supervisor on quality issues and be responsible for the following duties:

i. Oversee the technical operations of the Unit.
ii. Oversee Quality Assurance of the Latent Unit.
iii. Evaluate and document the approval of all validations and methods, and approve new or modified procedures.
iv. Review the training records for new hires and approve their qualifications prior to casework.
v. Review latent unit procedures as needed.
vi. Review and approve training, quality assurance measures, and proficiency testing program.

vii. A newly appointed Technical Leader will be responsible for reviewing relevant validation studies and methodologies currently used by the unit.

viii. Conduct verifications and assist with technical and administrative review of casework.
ix. Assist in assigning and administering proficiency and competency tests.

x. Assist in technical problem solving.

xi. May recommend suspension of casework for an individual or for the Unit.

b. Qualifications: The Technical Leader must be a full time employee of the Laboratory and have, at a minimum, the following education, experience, and training:

i. Meet the education requirements of a Fingerprint Examiner or degree requirements of a Criminalist.

ii. A minimum of four years of full-time laboratory experience as a qualified Latent Print Examiner. The four years of experience must be in the Latent Print Unit (full-time) conducting Comparison Casework. This experience must have been obtained at a laboratory where the Latent Print work was conducted for the examination of prints in criminal matters.

iii. Be a certified Latent Print Examiner by the International Association for Identification.

c. Authorization: The Technical Leader will meet the same requirements for authorization to conduct casework as other latent print examiners.

7. Technical and Administrative Reviews

a. Role: Technical reviews are independent of a verification. A technical review may be independent of or combined with an administrative review as one process.
i. See LP.46 for a list of technical review specifications.

ii. See FSD.18 for a list of administrative review duties.

b. Qualifications: The technical reviewer will be an employee of the laboratory who is a current or a previously qualified latent print examiner in the methods used at the laboratory, as well as, meets the experience and training requirements as specified in LP.46.

i. For best practice, the administrative reviewer typically will also be a qualified technical reviewer, however it is not required.

c. Authorization: Technical reviews will be conducted by individuals that have been found competent in the latent print discipline and who have been authorized to perform technical reviews.

i. Once an examiner has demonstrated competence in the technical review process (see LP.46 for criteria to demonstrate competence), authorization will be granted. Authorizations will be documented on completed authorization forms (see LPF.40, LPF.41, LPF.42) and will be maintained by the Unit Supervisor.

ii. Administrative reviewers are authorized by supervisors or managers, per FSD.18. The authorization will be documented on a completed authorization form (see LPF.41).

8. Validations and Performance Verifications

a. Authorization: Latent Unit staff found competent in the latent discipline may perform development, modification, verification and validation of methods.

b. See LP.69 for more information on validation and method selection.

9. Verifications

a. Role: A verifier conducts an independent analysis, comparison, evaluation (ACE) of a latent print comparison to either support or refute the conclusions of another examiner. See LP.23 for a list of the verifier’s responsibilities.

b. Qualifications: The verifier will be an employee of the laboratory who is a current qualified latent print examiner in the methods used at the laboratory, as well as, meets the experience and training requirements as specified in LP.23.

c. Authorization: Verifications will be conducted by individuals that have been found competent in the latent print discipline and who have been authorized to perform verifications.

i. Once an examiner has demonstrated competence in the verification process (see LP.23 for criteria to demonstrate competence), authorization will be granted. Authorizations will be documented on a completed authorization form (see LPF.41) and will be maintained by the Unit Supervisor.

END OF DOCUMENT
I. POLICY  The latent unit is committed to assuring the accuracy and reliability of the tests performed. The latent unit assures the quality of test results in a variety of ways.

A. Methods to Monitor the Validity of Results
   1. Use of reference and quality control materials
      a. See LP.40 and LP.71 for more information on use of the amino acid reference pad.
      b. See LP.36 for more information on use of a blood reference standard.
      c. See LP.31 and individual processing procedures for more information on quality control and test strip requirements.
      d. See LP.28 and LP.18 for more information on use of a reference print to check ABIS.
   2. Functional and intermediate checks of testing equipment
      a. See FSD.33 for more information on the requirement of a functional test of any equipment before being placed into service.
      b. See LP.18 for more information on periodic checks of equipment to ensure on-going proper function.
      c. See LP.28 for more information on periodically checking ABIS.
   3. Review of reported results
      a. See FSD.17 for more information regarding analyst responsibilities for checking reported results and conclusions.
   4. Verification of results
      a. See LP.23 for more information on the verification process. Interpretation decisions reached by an analyst of Identification and Exclusion will be verified by at least one qualified examiner. An inconclusive decision is verified at the discretion of the analyst.
b. The verification is not only the verification of the result, but the verification of the process and method used by the analyst to obtain the result.

c. See LP.23 for more information on the conflict resolution process for Verification.

5. Technical and administrative review

a. See LP.46 for more information on technical review.

b. See LP.31 for more information on the photo-documentation review requirements for test strips used for quality control purposes.

c. See LP.28 for more information on the documentation requirements for ABIS that includes a review of the minutiae selection used to launch a print through CAFIS.

d. See LP.31 for more information of the review requirements for evidence with ridge detail present that has no value.

6. Intralaboratory comparisons

a. See FSD.23 for more information.

B. Documentation and Recording

1. The data derived from monitoring activities above are documented the following ways:

a. Equipment Logs.

b. Reagent Logs.

c. Level 2 Corrective Actions.

d. Division Level Corrective Actions.

C. Monitoring

1. The outcome of monitoring is reviewed, at minimum, annually during an internal audit.

D. Methods Not Used to Monitor Tests

1. At this time, the latent unit does not use calibrated alternative instrumentation, control charting, replicate testing, nor correlating results from different characteristics of an item as those methods are not applicable to latent testing.

2. At this time, the unit does not retest retained items as all evidence items are returned to submitting agencies.

3. At this time, the unit does have procedures for blind verification but the process is not routinely used.

END OF DOCUMENT
I. THE HISTORY OF THE SCIENCE OF FRICTION RIDGE SKIN ANALYSIS (LPTF.02 History Training Checklist)

A. Purpose

1. To acquaint the trainee with the historical background of the science of friction ridge skin analysis.
   
a. From early recordings and teachings to modern methodologies and filing systems used today.

B. Objectives

1. The trainee will gain an understanding of the history of friction ridge skin examination dating back to prehistoric times, and will be exposed to other means of personal identification once used.

2. Upon completing this training module the trainee will possess the ability to recall notable historical events and early pioneers in friction ridge skin analysis.

C. Discussion

1. The technical basis for latent print individualization is based on the premises that friction ridge skin is persistent and unique, resulting in its use as a reliable form of personal identification for hundreds of years.

2. Readings for this training module focus on Sir Edward R. Henry, Sir William James Herschel, Dr. Henry Faulds, Alphonse Bertillon, Sir Francis Galton, Juan Vucetich, and others, as well as the early FBI Identification Division.

D. Examination

1. Successful completion of this module of training will be determined by a written test.

END OF DOCUMENT
I. BIOLOGY AND PHYSIOLOGY OF FRICTION RIDGE SKIN (LPTF.03 Biology and Physiology Training Checklist)

A. Purpose

1. To acquaint the trainee with the biological nature of friction ridge skin and its development, ridge characteristics, and the anatomy of the hands and feet.

2. To familiarize the trainee with general chemical composition of sweat and latent fingerprint residue.

3. To demonstrate the concept of uniqueness and persistence, the premises behind friction ridge skin examination.

4. To provide the trainee with sufficient practical knowledge in these subjects which will aid the trainee in understanding future lessons in the training program.

B. Objectives

1. The trainee will attain:

   a. The ability to define key terms.

   b. An understanding of the biological significance of friction ridge skin patterns and the epigenetic factors that influence their formation.

   c. Familiarity with cell differentiation and how friction ridges and minutiae form in utero, including the time frame in which they develop.

   d. Knowledge of the concept of biological uniqueness and persistence.

   e. An understanding of the general chemical composition of human sweat as a means of understanding the composition of latent print residue.

C. Goal

1. Upon completing this training segment, the trainee will possess an understanding of fundamental biological, embryological, and physiological principles for essential knowledge, as well as complement other phases of subsequent training.

D. Discussion
1. The minutiae on friction ridge skin can be grouped into three basic individual characteristics or combination of these characteristics:
   a. Dot (an isolated friction ridge unit whose length approximates its width in size)
   b. Ending Ridge (a single friction ridge that terminates within the friction ridge structure)
   c. Bifurcation (the point at which one friction ridge divides into two friction ridges)

2. The composition of latent print residue is such that chemical techniques can effectively be used to process impressions on many surfaces. The eccrine or sweat glands on the human body are most concentrated on the palmar surfaces of the hands and the soles of the feet. Secretions from the eccrine glands consist of 99.0% to 99.5% water and 0.5% to 1.0% solids. The solids consist of about one-half organic substances (alpha-amino acids being one of them), and one-half inorganic salts (sodium chloride being the most prevalent salt).
   a. The oils and fats which are present in latent print residue are primarily the results of sebum secreted by the sebaceous glands. Sebaceous glands are not present on the palmar surfaces of the hands nor the plantar surface of the feet. The oily and fatty deposits present in latent print residue are generally the results of contaminants present on the hands from contact with other areas of the body, or from other items such as lotion or food.

E. Examination

1. Successful completion of this segment of training will be determined by a written test.

END OF DOCUMENT
I. PATTERN INTERPRETATION (LPTF.04 Pattern Interpretation Training Checklist)

A. Purpose
   1. To aid the trainee in having a working knowledge of pattern interpretation. Information presented in this module will aid the trainee in understanding subsequent lessons.

B. Objective/Goal
   1. The trainee will attain a working knowledge of the three pattern interpretations (Loop, Arch, and Whorl) and their definitions and differentiation according to the Henry system of classification.

C. Discussion
   1. Pattern terminology refers to a classification system that facilitates the interpretation of the fingerprint patterns into one of the 3 categories.

   2. The Henry classification system as devised by Sir Edward Richard Henry (with modifications) was used by the overwhelming majority of law enforcement agencies in the English speaking world.

   3. This segment of training provides initial competency in the use of the Henry system. Emphasis is placed on actual interpretation of various fingerprint patterns.

   4. Since no two areas of friction ridge skin are ever exactly identical, ideally trainees will spend time studying known "close non-matches" or areas of skin that are similar so that differences may be seen and understood.

D. Examination
   1. Successful completion of this segment of training will be determined by a written test.

END OF DOCUMENT
I. CLASSIFICATION OF RECORD PRINTS (LPTF.05 Classification of Record Prints Training Checklist)

A. Purpose

1. To provide the trainee with an understanding of methods and procedures by which record fingerprints can be sorted so they may be found easily as the situation requires. The trainee will be required to become knowledgeable in the Henry and NCIC classification systems.

2. This block of instruction will demonstrate the importance of accurately interpreting fingerprint patterns in order to correctly classify or group fingerprint records.

3. Introduction to the extensions and modifications of the pure Henry System which were used at one time by most identification bureaus and are still used by few agencies throughout the world.

B. Objectives

1. The trainee will attain:
   a. Knowledge of the Henry and NCIC classification systems.
   b. The ability to classify "approximating" patterns and combinations of missing, bandaged, or scarred fingers.
   c. Familiarization with the fingerprint/palm print records process (civil and criminal), including attaining, searching, and filing methods currently utilized by law enforcement agencies.

C. Discussion

1. While the Latent Print Unit does not maintain fingerprint/palm print records, it is important to have knowledge of historical filing systems, and to have the ability to classify record prints using the Henry or NCIC classification systems should there be inquiries from other agencies.

D. Examination

1. Successful completion of this segment of training will be determined by a practical exercise in classification using the Henry and/or NCIC classification system.
a. Practical exercise may be substituted by the successful completion of an equivalent quiz (e.g., Contra Costa County Central Identification Services Fingerprint Academy).

END OF DOCUMENT
I. RECORDING FRICITION RIDGE SKIN (LPTF.06 Recording Friction Ridge Skin Training Checklist)

A. Purpose

1. To familiarize the trainee with the materials, procedures, methods, and techniques of recording all areas of friction ridge skin, including decomposing skin.

2. The trainee will gain sufficient practical working knowledge and skill to demonstrate acceptable proficiency in recording friction ridge skin.

3. In this training module, emphasis will be placed on practical hands-on exercises using various available mediums.

B. Objectives

1. The trainee will attain:

   a. A working knowledge of various friction ridge skin recording equipment and methods necessary for proper collection of exemplar prints (e.g., ink, powder, livescan,).

   b. The ability to completely and legibly record all pertinent detail of the hands and feet.

   c. Familiarity with obtaining complete and legible post-mortem record impressions and a working knowledge of various procedures and techniques for obtaining friction ridge skin exemplars under differing states of decomposition (to include burned, soaked, and mummified skin).

      i. Experience in collecting post-mortem exemplars will be accomplished over time as the opportunity arises.

C. Goal

1. Upon completion of this training module the trainee will possess the knowledge and ability to recover legible recordings of friction ridge skin. The trainee will also be prepared to assist and/or instruct personnel from other departments on the best method of friction ridge skin collection under varying circumstances.

D. Examination
1. Successful completion of this segment of training will be determined by a practical exercise (exemplar collection).

END OF DOCUMENT
I. Friction Ridge Processing, Development, and Collection (LPTF.07 Processing Training Checklist)

A. Background/Theory

1. Latent print visualization may be achieved using various visual, physical, or chemical processes. Deciding what techniques(s) to use to develop friction ridge evidence depends on several factors including:
   a. The type of latent print residue.
   b. The type of substrate.
   c. The texture of substrate.
   d. The condition of substrate (clean, dirty, bloody, sticky, etc.).
   e. Any known environmental conditions during or following friction ridge deposition.
   f. If known, the length of time since deposition.
   g. Possible consequences of destructive processing methods.
   h. Any subsequent forensic examinations.
   i. All sequential ordering of reagents.

2. The trainee will be required to become knowledgeable and competent in their decision-making skills regarding all of the above commonly encountered factors in latent print processing.

B. Training Objectives

1. For successful completion of this module, trainees will understand and demonstrate the following:
   a. Evidence Handling
      i. Proper handling, storage, and contamination prevention.
      ii. Correct opening and sealing procedures of a variety of evidence containers encountered during processing.
iii. The importance of chain of custody and how to properly document including transfers made in LIMS.

b. DNA Collection and Preservation
   i. Proper DNA collection and preservation techniques.
   ii. Proper contamination prevention techniques including proper swabbing or other biological collection procedures.
   iii. Consultation process and issuing reports that include testing done by other units.

c. Use of Reagents and Controls (Test Strips)
   i. How controls (positive and negative) are utilized to test the efficacy of chemicals or chemical solutions.
   ii. How to properly prepare chemicals and solutions (reagents) relevant to the methods utilized.

d. Use of Equipment
   i. Basic concepts relating to laser and alternate light source (ALS) theories as applied to friction ridge visualization.
   ii. Knowledge of photography, lenses, and filters and when/how to capture as evidential images.
   iii. How to use various equipment (as listed on LPTF.07).

e. Processing
   i. Knowledge of the approved procedures, including "best practices" for processing evidentiary items for the recovery of latent prints.
   ii. Knowledge and competence in the choice of technique(s) for latent development, including the use of all equipment.
   iii. Understanding of the physical, chemical, and lighting techniques used in friction ridge development and the foundation of their scientific principles.
   iv. Understanding of different types of matrix, substrate, and development medium variations for latent print processing.
   v. The optimum environmental conditions for each method. For example, temperature and humidity considerations.
   vi. Awareness of some other development techniques not currently being used in this laboratory.
   vii. Familiarization with developing new processing techniques, methods, and equipment; to include acquaintance with the laboratory's validation process.
   viii. Understanding of processing multi-substrate items.

   1. Trainees must be exposed to complex items that require atypical decision-making during hands-on processing exercises. For
example, items with a combination of porous, semi-porous, non-porous, and adhesive components.

f. Sequencing
   i. Understanding of the importance of following the proper sequencing of latent print development techniques.
   ii. How to properly apply all processing and collection methods using appropriate procedures with respect to other methods.
   iii. Understanding of the impact of each method (and combination thereof) on the appearance or stability of the impression.
   iv. Understanding of the impact of choosing reagents out of proper sequence and inability to correct the mistake.

g. General Collecting and Preserving
   i. Ability to lift and photograph ridge detail on varying surfaces.
   ii. Ridge detail suitable for comparison should be photographed before the application of a technique or subsequent technique.

h. Suitability Determinations
   i. Ability to appropriately determine if ridge detail present on evidence is of value or not and when a technical review is needed from another qualified analyst.
   ii. Ability to decide when collection of ridge detail is appropriate.
   iii. Ability to determine if no ridge detail developed.
   iv. There may be analysts trained in processing and not suitability determinations.

i. Notes and Reports
   i. How to take clear, detailed, contemporaneous notes during processing.
   ii. How to correctly enter information into LIMS including appropriate boxes or drop-down selections.

j. Health and Safety
   i. Proper utilization of ventilation (fume hoods).
   ii. Proper use of eye wash stations and personal safety showers.
   iii. Proper use of personal protective equipment (PPE).
   iv. Awareness and review of relevant health and safety considerations with respect to proper interpretation of Safety Data Sheets (SDS).

k. Testimony
   i. Ability to competently testify on results for all reported conclusions.

C. Reading

1. For the list of required reading materials, refer to LPTF.07.
2. The readings must be completed prior to taking the competency test. It is recommended that the trainee do the readings in conjunction with the "hands-on" training portion to fully grasp the materials learned.

3. A reading list and abstract are encouraged.

D. **Practical Exercises**

1. Prior to starting hands-on training, it is highly recommended that the trainee complete about 8 hours of "shadowing" other trained staff doing processing.

2. Hands-on exercises will be implemented following the introduction to development techniques, collection methods, and equipment.
   a. Ideally, the trainee will demonstrate their understanding of new processes learned a minimum of five times using case-like materials. Feedback will be provided by the trainer.

3. Once the trainee has learned all processing methods, they will be expected to process a **minimum of two mock cases** to include the following elements:
   a. Transferring "evidence" in LIMS.
   b. Opening and sealing packaging.
   c. Documentation of all notes and report elements in LIMS.
   d. Processing "evidence" with appropriate methods and in the correct sequence.
   e. Collection of biological evidence.
      i. a mock consultation with a DNA analyst is recommended.
   f. The mock cases will be successful through an Admin Review of the test case in LIMS by the trainer prior to moving on towards competency testing.

4. **The above hands-on exercises and mock cases must be observed and documented by the trainer.**
   a. Documentation may take place on the Observation Based Worksheet: [LPF.47](#) or by other forms of written feedback.

5. The trainer is encouraged to use other forms of practical exercises as well. For example:
   a. Study questions.
   b. Creating a presentation.
   c. Quizzes.

E. **Suggested Training Courses**

1. The following classes are highly recommended; however, the trainee is not required to take external classes prior to competency testing:

   b. [California Criminalistics Institute (CCI)](https://oag.ca.gov/cci/classes): "Latent Print Techniques" (E151)
F. Assessment

1. During training, the trainer must assess the readiness of the trainee to take and successfully complete the competency test. The following areas must be reviewed:
   a. **Mock casework**: items processed, notes taken, test case completed in LIMS, etc.
   b. **Photos** (digital images) generated.

2. In addition to the above, reading abstracts, journals, practical exercises and assignments, training binder, or other materials created during training should also be reviewed as an assessment of the trainee's readiness.

G. Examination

1. Successful completion of this segment of training will be determined by passing a competency test. The performance expectations for each item in the competency test are:
   a. Proper selection of development techniques.
   b. Proper sequence of development techniques.
   c. Proper selection of suitable latent prints for collection (requires training in suitability).
      i. if the trainee is not trained in suitability, this does not apply.
      ii. if the trainee is trained in suitability, it is expected that all suitable latent prints are selected and that no more than 2 **unsuitable** latent prints are selected.
   d. Proper forensic photography.
   e. Proper digital imaging.
   f. Adherence to policies and procedures.
   g. Accurate completion of notes.
   h. Accurate completion of LIMS worksheet(s) or documents and report.

2. The competency test will consist of the following components:
   a. A written test of knowledge to demonstrate the individual's understanding and comprehension of processing and collection.
      i. when possible, the written test will be completed successfully prior to the analyst being assigned the unknowns (practical test).
   b. Examination of sufficient unknown samples to cover the anticipated spectrum of assigned duties.
      i. analyst will process a variety of porous and non-porous case-like materials.
   c. A written report to demonstrate the individual's ability to properly convey results in LIMS.
d. A verbal practical examination of the individual's ability to provide testimony with regard to processing and collection.

3. See LPF.42 for Authorization form.

END OF DOCUMENT
I. ACE-V METHODOLOGY  (LPTE.08 ACE-V Methodology Training Checklist)

A. Purpose

1. To provide the trainee with an understanding of the ACE-V (Analysis, Comparison, Evaluation, Verification) process from determining the suitability of latent prints for subsequent comparisons, to reaching conclusions and obtaining verifications. ACE-V methodology is a process by which latent print examiners arrive at conclusions which are then verified as a quality assurance measure. Latent orientation and all areas of friction ridge skin (anatomical regions) typically seen in casework are to be thoroughly studied and practiced in this module. The trainee is expected to become capable of providing a reasonable explanation for apparent differences within tolerance of an identification, and understand issues of distortion. Throughout this training module, the trainee will be exposed to a variety of comparison exercises, varying in difficulty, as well as learn to document the ACE process.

B. Objectives

1. The trainee will attain:
   a. The ability to correctly describe and apply the ACE-V methodology to latent print examinations.
   b. A working knowledge of ACE-V policies followed by the latent unit.
   c. Accuracy in identifying and excluding latent prints, including ability to provide reasonable explanations for inconclusive decisions.
   d. The ability to demonstrate the ACE process by documenting examinations.
   e. A better understanding of information learned in previous modules and how it can be applied to ACE-V.
   f. Familiarity with causes and signs of the many forms of distortion found in latent prints.
   g. The ability to accurately discern the probable orientation and anatomical region of a latent print.

C. Goal

1. At the successful completion of this training module and accompanied latent comparison competency test, the trainee will have attained sufficient experience and displayed competency in the ACE process of latent print examinations. This will enable the trainee to begin a period of supervised casework.
D. Discussion

1. ACE-V is the most important phase of the training program and requires the most time and attention from the trainee. It is expected that the trainee will successfully complete several comparisons (with varying levels of difficulty), as well as analysis documentation exercises (to include orientation practice, selecting target data, "search smart" clues, quality assessing, distortion evaluation, etc.) prior to finishing this segment of training. The ability to grasp this subject matter together with accurate practical application is essential to the successful completion of the latent training program, and to becoming a competent latent examiner.

2. Accuracy in comparison results of latent print examinations may not only reflect upon the individual analyst, but also on the entire department. The importance in accuracy of latent print individualization is nowhere more evident than in the potential of this evidence in judicial proceedings. It is imperative that accuracy be uppermost in the mind of the analyst during latent print examinations.

E. Examination

1. Successful completion of this segment of training will be determined by passing the Latent Comparison Competency Test. The test will consist of a practical examination section with several latent comparisons (preferably provided by an external vendor), a written test, and issuing a report in LIMS.

2. Throughout training in this module, trainees can expect increasingly difficult analysis and comparison exercises. The trainee will practice using all facets of ACE during this training. These exercises should also consist of latent prints from various areas of friction ridge skin.

Next Training Webinar to be held late September, 2019
Resizing Latent Prints

✱ There are four methods for resizing latent prints if it was not captured at a 1:1 ratio

✱ Resizing by a **Given Scale** – Use if you know the ratio at which the print was captured

✱ Resize to **Half** – Use this to reduce the print image to half its size

✱ Resizing by **Ruler** – Use this method when a ruler is visible in the image

✱ Resizing by **Ridge Count** – Use this as a last resort if the other options are not available
Resizing Latent Prints
Resizing Latent Prints

File Import Option

You have an option to select the resolution
Resizing Latent Prints – Image Resolution

Where can you get image resolution information?

Right-click on image file – select Properties

Click on Details tab
Resize by Ruler – Clip Box

1 inch box = 2.54 cm

Imported Image
Resize by Ruler – Clip Box

Before and after resizing

1 inch or 25.4 cm
Opened image at 1000 resolution

Re-opened the image at 500 resolution
Resizing Latent Prints

Once the image is displayed at the scan window, click the resize drop-down arrow.
Resize by Ruler - Metric
CABIS 6 – Image Resolution of 500 or 1000 will depend on the selection made in the Resolution field at the File Import window.

CABIS 7 – Select the template/form at the Scan window for the resolution.
Resize by Ruler - Metric

Click and hold the mouse and a + will display on the ruler. Draw a line across two known points on the ruler and release the mouse button.
Resize by Ruler - Metric

Note the yellow tick marks on the ruler. The tick marks represent the ruler lines.

• To add a marker that may have been missed, click and hold the middle mouse button and drag to add a marker.
• To delete a marker, place the cursor on the marker and right click with the mouse. The marker will be deleted and the other markers will automatically be renumbered.

Note: Above steps is for CABIS 6
Resize by Ruler - Metric

Hash mark at the beginning and not the end

Both options had a hit in AFIS with candidate rank #1
The print below is black powder on a thumb and a “rollerball” glue stick placed on top. After the glue dried, it was lifted and taped to a lift card. Lift card was scanned at 1000 dpi.

Notice how much of the latent print fits inside the clip box.

Also note the area displayed in the image.

1000 dpi image opened with 1000 dpi option

1000 dpi image opened with 500 dpi option
What happens if an image is not 500 or 1000 dpi? E.g. 96 or 72 dpi
Below image is 96 dpi (print taken using iPhone).

Resized using 500 dpi option

Hit in AFIS – Candidate #1
Resize by Ruler - Inches
Resize by Ruler - Inches

Note the marker lines on the ruler for 1000 dpi
Resize by Ruler - Inches

Marker lines need to be every other one

1000 dpi
Resize by Ridge Count
Resize by Ridge Count
Resize by Ridge Count
Resize by Ridge Count
Resize by Ridge Count

Select random areas of the print – some areas may be compressed and other areas have ridges spread out.
Resize by Given Scale
Resize by Given Scale

If you know the ratio the print was captured, you can enter the information below.

For example, if you know the print was captured at half its original size then the print needs to be twice its size and the number in the field is changed to 2.0.
Resize by Given Scale

Numbers from previous ridge count options
105 + 113 + 164 = 382 / 3 = 127.3333

Changed below to 1.2

Both hit in AFIS

Resizing Latent Prints

The red clip box could be used as a reference for the sizing if no other option is available.
Cores and Deltas
Understanding Cores and Deltas for an AFIS Search
Cores and Deltas

Cores are the approximate center of the print
Deltas are where the ridges flow in approximately three different directions
Cores and Deltas

“Do I need to add cores and deltas to my latent print?”

“Do the cores and deltas help with getting a hit?”

Answer:
“It depends on the quality of your print”
Cores and Deltas

- CABIS is analyzing and matching minutiae and their angles.
- If core(s) and delta(s) are added, the system may use those as references for the minutiae and could narrow the searching for a match.
- A distorted latent print with minimal minutiae may benefit with adding additional features like core(s), delta(s), and pattern.
- In addition, adding cores and deltas may assist with the ridge flow and ridge count which can also be beneficial for the searching/matching.
Cores and Deltas

- Could possibly help by adding core and delta
- Does not help with searching and matching without a delta
- Core visible, but delta is unknown
- Core and delta not needed
Cores and Deltas

An examiner puts whorl as the pattern

CABIS looks at all these different types of ridge flow for a whorl

Plain Whorl  Central Pocket  Double Loop  Accidental
Cores and Deltas

The distance from core to the left delta and/or core to the right delta could narrow down the possibilities of all whorls in the system.
Cores and Deltas

Core size can be expanded if necessary

Imagine the distance from core to delta using the images above
Cores and Deltas

Can assist with ridge flow
Cores and Deltas

Auto is the best and preferred option. System will check/compare the distances between cores and deltas.

No core has no effect on the search and will not do anything related to core(s) or delta(s).

Core means ONLY prints with cores will be searched. Not Recommended!
Summary

The minutia map is one step in the searching and matching of latent prints. Depending on the quality of your latent print, adding other features like core, delta, patterns and checking ridge flow and ridge tracing/ridge count will increase your chance of getting a match for poor quality / distorted latent prints.

![Diagram showing the process from biometric to minutia points to minutia map and data stream](image-url)
Summary

- CABIS offers various options for the latent print examiner to search latent prints that have been digitally captured:
  - Ruler – metric and inches
  - Given Scale – known size
  - By Half – reduce 50%
  - Ridge Count – last resort and no scale in image

- Adding core(s) and delta(s) can help with the matching, especially for poor quality prints.

- Ridge flow, ridge count and adding a pattern to the latent print can also help with the matching.

- At the Search Parameter window, keep the options as the default. Rotation may be the only option to change (if orientation is unknown).

- Try searching your latent print more than once using different options stated above if there was no hit the first time.
Thank you!

Any Questions?
I. AUTOMATED DATABASE SEARCHING (LPTF.09 Automated Database Searching Training Checklist)

A. Purpose

1. This training module is designed to equip the trainee with the necessary skills and ability to operate friction ridge automation technology.
   
a. Prior to beginning this section of training, the trainee should possess the knowledge, skill, and ability to recognize various levels of quality in latent prints.

2. Upon completion of this training, and prior to completing latent ABIS cases, the trainee must demonstrate knowledge and proper use of an Automated Biometric Identification System (ABIS) by passing a competency test.

B. Authorization

1. As determined necessary for assisting with cases, the unit Supervisor or Manager can authorize trainees to perform entry only latent searches into the ABIS database(s) prior to the completion of this module and competency test, under the direction of the TC/Technical Lead, or designated latent examiner. The trainee will not be authorized to determine the result of latent searches or issue reports prior to the successful completion of this module and competency test.

C. Objectives

1. The trainee will attain:
   
a. History perspective of automation technology and theory of operation.
   
b. Knowledge of various available automated databases and their limitations.
   
c. The ability to properly input (scan or import) images into each available system, retrieve the results, and complete the searching process.
   
d. Familiarity with determining suitability for entry into ABIS.
   
e. An understanding that ABIS is only a tool and that an individualization is made by an examiner.
   
f. Instruction for maintaining the database(s).
D. **Goal**

1. The trainee will possess the knowledge and ability to successfully search latent prints through ABIS.

2. The trainee will be familiar with ABIS procedures and documentation requirements as instructed by the Latent Unit Technical Policies. See [LP.28](#).

E. **Examination**

1. Successful completion of this segment of training will be determined by passing a competency test. The test will consist of a practical examination (searching prints through ABIS), a written test, and issuing a report in LIMS.

END OF DOCUMENT
I. FORMS, RECORDS AND REPORTS (LPTF.10 Forms, Records, and Reports Training Checklist)

A. Purpose

To acquaint the trainee with forms, note taking practices, and reports internal to the Forensic Services Division and the records maintained at the Laboratory, as well as the manner in which the results of examinations are reported.

B. Objectives

The student will attain:

1. A working knowledge of the various forms, records and reports related to daily operations in the Latent Print Unit.

2. The ability to properly complete the forms necessary to accomplish and document the examination of physical evidence, including documentation in LIMS.

3. The ability to properly report the results of latent examinations.

C. Goal

Upon completion of this segment of training, the trainee will possess knowledge and understanding of the requirements for maintaining accountability of evidence, including the importance of taking contemporaneous notes. The notes need to be clear so that steps taken during the examination are understood by another examiner and the analyst to render a clear and accurate written report.

D. Discussion

The written report is often the initial information available to the submitting agency, and to the servicing legal office upon which a determination is made.
as to the prosecution of a criminal case. It is therefore essential that accurate, clearly written and informative reports be returned to the submitting agency. During this segment of training, the trainee will ultimately be required to practice properly completing appropriate forms, records, notes, and render written draft reports pertaining to the test "evidence" which he or she examined. Emphasis will be on test "evidence" accountability, contemporaneous note taking and the completed laboratory report.

E. Examination

Successful completion of this segment of the training program will be determined by evaluation of the practical application and knowledge of the above items of documentation.

END OF DOCUMENT
I. PRESERVING, MARKING AND PACKAGING EVIDENCE (LPTF.11 Evidence Handling Training Checklist)

A. Purpose

1. To present the trainee with the procedures and laboratory practices of evidence handling.

B. Objective

1. The trainee will attain:
   a. A sound working knowledge of proper procedures for handling evidence to include:
      i. appropriate methods of opening packages
      ii. marking items of evidence upon completion of testing
      iii. packaging and re-packaging evidence
   b. Familiarity with properly maintaining evidentiary value of evidence being processed through multiple units.

C. Goal

1. Upon completion of this segment of the training program, the trainee will possess knowledge and understanding enabling him or her to properly maintain the integrity and evidentiary value of evidence.
   a. The trainee will be able to demonstrate correct procedures for opening, marking, packaging, and handling evidence items.
   b. The trainee will be able to demonstrate the ability to advise and instruct personnel from other agencies, or other units within the laboratory, regarding the protection and transmittal of evidence being tested for latent prints.

D. Discussion

1. Proper packaging procedures will be practiced under the direct supervision of the Training Coordinator.

2. Training will include discussion of shared evidence between the latent unit and other units within the laboratory.
3. Demonstrating proper preservation, packaging (opening, sealing, re-packaging), and marking of evidence will constitute successful completion of this segment of training.

END OF DOCUMENT
I. TECHNICAL TRAINING COURSES (LPTF.13 Training Courses, Resources, and Certification Training Checklist)

A. Purpose

1. To provide the trainee with training resources which can be gained from outside the Forensic Services Division. Exposure to a variety of specialists and professionals will afford the trainee the opportunity to exchange methods and techniques, as well as provide the trainee with necessary tools to enhance his or her knowledge and abilities in the latent discipline.

2. While membership in any professional association is not required, it is recommended for the value of continual information available through workshops and seminars as well as professional publications.

3. Latent Print Certification through the International Association for Identification is not required, but is desireable and benefits not only the employee and employer, but also the courts.

B. Goal

1. Upon completion of this segment of training, the trainee will have attained an understanding of available avenues to complement the studies and experience gained in the latent unit training program. Some areas of specialized external training are listed below. In the process of receiving valuable external training, the trainee will also have attained better foundation for acceptance in judicial proceedings as an expert witness.

C. Examination

1. There is no exam for this module.

2. Trainees may receive external training as availability of funds/managerial approval and individual courses, seminars or workshops are available. A copy of the course completion diploma or certificate will become part of the trainee's training binder.

D. Organizations offering training include (but are not limited to) the following:

1. The California Department of Justice: California Criminalistics Institute, www.ag.ca.gov/cci/courses
a. Sampling of courses offered that may be used as supplemental training:
   i. Latent Print Techniques
   ii. Latent Print Comparisons
   iii. Firearms Safety

2. Ron Smith and Associates, [www.ronsmithandassociates.com](http://www.ronsmithandassociates.com)
   a. Sampling of courses offered that may be used as supplemental training:
      i. Introduction to the Science of Friction Ridge Examination
      ii. Essential Ridgeology Concepts
      iii. Scientific Analysis (ACE-V): From the Laboratory to the Witness Stand
      iv. Courtroom Testimony Techniques - Success Instead of Survival
      v. Palm Print Comparison Techniques
      vi. IAI Latent Print Certification Test Preparation Training
      vii. Understanding Sufficiency and Exclusion Decisions

3. Mike Stapleton and Associates, [www.stapletonandassociates.com](http://www.stapletonandassociates.com)
   a. Sampling of courses offered that may be used as supplemental training:
      i. Fingerprint Identification & Classification
      ii. Advanced Latent Print Comparison and Identification Training Course
      iii. Latent Print Development and Recovery
      iv. Crime Scene & Forensic Photography

4. West Virginia University, [www.fsi.research.wvu.edu](http://www.fsi.research.wvu.edu)

5. The California State Division of the International Association for Identification, [www.csdiai.net](http://www.csdiai.net)

6. The International Association for Identification, [www.theiai.org](http://www.theiai.org)

7. California Association of Criminalists, [www.cacnews.org](http://www.cacnews.org)

8. Southern California Association of Fingerprint Officers, [www.scafo.org](http://www.scafo.org)

10. Forensic Pieces, [www.forensicpieces.com](http://www.forensicpieces.com)

12. Alice Maceo, [www.evolveforensics.com](http://www.evolveforensics.com)

15. Forensic Technology Center of Excellence / RTI International, www.forensicCOE@rti.org

E. **Resources**

2. Ed German website, www.onin.com

END OF DOCUMENT
I. Ethics, Legal Aspects and Forensic Science  
   (LPTF.14 Ethics, Legal Aspects and Forensic Science Training Checklist)

A. Purpose

1. To familiarize the trainee with criminal and civil law proceedings, including what to expect and how to prepare for various courtroom hearings.

2. To gain an understanding of legal aspects as they pertain to latent print examination.

3. To understand significant court cases involving latent prints and how these outcomes have affected the field of friction ridge analysis.

4. To bring awareness to the trainee of reports concerning falsified latent print evidence and ways to detect attempts to produce forged or fabricated evidence.

5. To acquaint the trainee with ethical aspects of forensic science. For Division policy on ethics requirements and information see FSD.21

6. To assess the trainee's experience and/or training in other forensic disciplines and provide exposure (e.g. shadowing examiners in other disciplines within the laboratory) as needed.

B. Objectives

1. The trainee will attain:

   a. Knowledge of the legal aspects for recording and collecting friction ridge skin exemplars from an individual.

   b. Perspective for the lack of specific number requirements or standards of matching ridge characteristics ("points") necessary to effect and individualization within the discipline, and the implementation of a quality assurance administrative standard addressed in the Latent Print Unit Technical Manual. See LP.19

   c. Familiarization with precedent setting legal cases involving friction ridge examinations.
d. The tools necessary to construct a chart to be used in court to demonstrate a latent print comparison.

e. The ability to demonstrate proper courtroom demeanor, present a case/report, use displays during testimony, and minimize stress while on the witness stand.

f. An understanding of the ethical requirements in conducting latent print examinations.

g. The ability to create and maintain a Statement of Qualifications and a Curriculum Vitae.

h. Ability to demonstrate a general understanding of other forensic science disciplines.

i. The trainee's exposure to other disciplines and/or completion of the reading materials will be documented on the training checklist.

C. **Goal**

1. Upon completion of this training module the trainee will possess the knowledge and ability to effectively present expert testimony in court. The trainee will also gain a clear understanding of the ethical responsibilities bestowed upon the friction ridge analyst, as well as display a general understanding of the various forensic science disciplines.

D. **Examination**

1. Successful completion of this training module will be determined by a written test.

END OF DOCUMENT
I. FINAL EXAMINATION (LPTF.15 Final Examination Training Checklist)

A. The Final Examination for the Latent Print Examiner Course of Instruction will consist of a Mock Trial. The purpose of a mock trial is to demonstrate the analyst's professional demeanor, knowledge, and skills to effectively communicate to attorneys, judges, and juries.

1. Each person participating in the mock trial will complete an Internal Court Testimony Critique Form FSDF.02
   a. The court critiques will be stored in the analyst's training binder and may also be imaged into LIMS.
   b. Feedback will be provided to the analyst upon completion of the mock trial.

2. The mock trial can be videotaped and should not last more than two hours.

3. The trial may be stopped at any time upon the request of any involved parties.

4. The three competency tests should be successfully completed prior to the final exam. LPT.07, LPT.08, and LPT.09.

5. For a successful Mock Trial, the analyst must be able to effectively communicate and answer technical questions correctly.

6. A failed Mock Trial will result in remedial training. See LP.53 for information on remedial training.

END OF DOCUMENT
**Mission Statement**

Property and Evidence Services exists in order to receive, catalog, safely store, and maintain the integrity of evidence, found property, and property for safekeeping. The function allows for the effective prosecution of criminal offenders while confirming innocence; and victims may find truth and closure as justice is served. Lastly, law enforcement agencies have the legal obligation to restore evidence/property to rightful owners or facilitate the legal disposition of evidence/property in agency’s possession.

**Goals**

The goals of Property and Evidence Services are:
1. Maintain the security, control and integrity of evidence and property placed in the custody of Property and Evidence Services within reasonable bounds and in accordance with local, state and federal laws.
2. Provide quality service to Property and Evidence Services clients.

**Objectives**

The objectives of Property and Evidence Services are:
1. Provide a safe and healthy working environment for Property and Evidence Services employees.
2. Maintain the accuracy of documentation for evidence or property placed in the custody of Property and Evidence Services.
3. Facilitate the movement of evidence between the department and outside agencies as needed for lawful purposes.
4. Dispose of property in accordance with all applicable local, state and federal laws.

**APPROVED BY:** Rich Wara & Pamela Hofsass

**REVISION DATE:** 04/18/2019

**NUMBER:** PROP.05 - Intake Procedures
I. POLICY: Property and Evidence Services employees will dispose of unclaimed inmate property transferred from the Office of the Sheriff Custody Services Bureau (CSB).

A. REFERENCE

1. Custody Services Bureau Policy and Procedures-Detention-Chapter Eleven: Intake, Transfer, and Release-Policy # 2.11.24 Unclaimed Inmate Property Purging
2. Government Code Sections 26640, 26641 & 26642

B. GENERAL INFORMATION

1. The Custody Services Bureau is responsible for processing unclaimed inmate property in accordance with applicable laws and policies.
2. Inmate property submitted into Property and Evidence Services does not require the following:
   a. Entry on a Station House Log
   b. An Office of the Sheriff case file number
   c. A tape sealed container
3. Inmate property may be disposed of immediately. Property and Evidence Services employees will determine the correct method of disposal. See PROP.09.

C. PROCEDURE

1. Inmate property will be segregated according to the following types disposition:
   a. Sale at auction
      i. Inmate property will be assigned an auction company bar code for tracking purposes.
      ii. Any revenue generated from the sale of inmate property will be deposited into the general fund account of Office of the Sheriff.
   b. Donation to charity
   c. Recycle / Reuse
      i. Books from the Detention library and inmate uniforms will be returned to the Custody Services Bureau.
   d. Destruction

2. No further documentation is needed after disposition.

C. FOUND PROPERTY

1. Found property will be retained for 100 days then destroyed, disposed, or auctioned.

2. Found property will be examined to determine ownership.

   a. If an owner is located, the item(s), with the exception of drugs and firearms, will be returned to the owner immediately. Refer to PROPERTY TO BE RETURNED TO OWNER.

   b. If an owner is not located or the property remains unclaimed after 90 days, the finder may claim it. For found property to be released to a finder:

      i. The finder must have signed a Declaration of Found Property or name listed in the case report as the finder.

      ii. The finder must call Property and Evidence Services within 10 days after the expiration of the 90 day storage period.

      iii. If the property value is $250 or more the finder must:

          1. Publish a notice of found property once in a newspaper of general circulation published in Contra Costa County.

          2. After 7 days from the date of publication of the notice, the finder may call Property and Evidence Services to determine if the owner of the property has been located. If the owner has not been located, the property should be released to the finder upon furnishing proof of publication.

      iv. If the property is valued at less than $250, no publication is required and should be released to the finder.

      v. The property will be disposed if the finder fails to furnish either proof of publication or fails to claim the item(s) within 100 days from the date the Declaration of Found Property was signed.

D. SAFEKEEPING PROPERTY

1. Safekeeping property will be retained for 60 days (or one year if arrangements are made by the owner) per Penal Code Section 2080.10 CCP.

2. If the owner claims the property, return the item(s) to the owner.

3. If the person, from whom property was taken, does not claim it or make other arrangements within 60 days, the property shall be disposed.

4. If within 60 days the person from whom the property was taken makes arrangements with Property and Evidence Services, the item(s) shall be held for an additional 10 months or a total period of 12 months. The property shall be disposed if the owner does not claim the safekeeping property after the 12 month period.
E. PROPERTY TO BE RETURNED TO OWNER

1. Property, other than stolen or embezzled property, shall be released to the owner upon receiving a release authorization. Upon receiving authorization to return property, a notification will be made to the owner.
   a. Generate a letter with the date the property will be disposed
   b. Mail to the owner at the last known address
   c. Calendar the disposal date indicated on the letter

2. If the property is not claimed by the date set for disposal, the property becomes unclaimed. Refer to PROCESSING OF DISPOSABLE PROPERTY.

3. If the property is claimed, the owner will visually inspect the property to ensure ownership. To return the property:
   a. Verify ID by asking to see proof of identification (example: CDL or Passport). For person(s) who were incarcerated in any Contra Costa County Detention facility, a booking photo can be used as verification.
   b. Document in EvidOnQ the ID information that was verified.
   c. Update EvidOnQ
   d. Remove property with a CLETS FCN from the RMS system

4. Release of marijuana may be permitted if the possession meets the following criteria:
   a. The marijuana being requested must be stored in Property and Evidence Services for safekeeping.
   b. Possessor was over the age of 21 when the confiscation occurred, did not possess more than 28.5 grams (1 ounce) of marijuana or more than 8 grams of concentrated cannabis.
   c. Marijuana sent to Property and Evidence Services as evidence requires the approval of an investigator prior to release.
   d. In all cases, marijuana will only be returned to the owner pursuant to a court order.

F. STOLEN OR EMBEZZLED PROPERTY RETURNED

1. Stolen or embezzled property may be returned to the owner pursuant to 1411 P.C. The property will be returned to the owner by:
   a. Court order or
   b. Approval from the Investigations Division

2. To return property to the owner refer to PROPERTY TO BE RETURNED TO OWNER.

G. PROCESSING OF DISPOSABLE PROPERTY

1. Review the authorization for authenticity and completion.
2. Query EvidOnQ to obtain the current location of the property.
3. Specialized destructions are handled as follows:
   1. Drugs/narcotics will be processed when the volume justifies destruction - Refer to PROP. 17 - Destruction/Disposal Controlled Substances and Paraphernalia
   2. Hazardous materials will be processed when the volume justifies destruction. - Refer to PROP. 16 - Hazardous Material Disposal
   3. Monies for deposit will be processed quarterly. Refer to PROP. 18 - Disposition of Unclaimed Money/Revenue Deposit Permit
   4. Firearms and ammunition are given to the armorer for handling. Refer to PROP. 13 - Release of Firearms and PROP. 14 - Firearms/Ammunition Destruction

4. General property will be located and pulled from the active storage.
5. Verify the bar code on the container and the property pull list are the same.
6. Open the property containers and match to the property pull list, then determine the following:
   a. Property of value - Place in an auction box - see PROPERTY FOR AUCTION.
   b. Property of no value - Place in a destruction box section - see DESTRUCTION OF PROPERTY WITH NO VALUE.
c. Property that is recyclable - Place in a recycle box section - see RECYCLE / REUSE OF PROPERTY.

d. Property appropriate for charity. - Place in the charity/box section - see PROPERTY RELEASED TO CHARITABLE ORGANIZATIONS.

e. Approved requests for property that may be converted to department use. If requested, set aside for department use - see PROPERTY CONVERTED TO DEPARTMENT USE.

f. Property with a commercial container that can be identified shall be returned to the business - see PROPERTY TO BE RETURNED TO OWNER.

H. PROPERTY FOR AUCTION

1. With the exception of firearms, unclaimed or abandoned property which is of value will be sold at a public auction.

2. Classify property.
   a. Write on a blank auction manifest form the category, make, model, type of item and serial number.
   b. Utilize bar codes from the auction company and assign the property a bar code.

3. Separate property into categories for sale at auction (example: cell phones, electronic devices, tools, bicycles, computers and laptops, etc.).

4. Generate an auction manifest report and match the bar codes on the report to the bar coded property in the segregated box.

5. Make two photocopies of the auction manifest report.
   a. The original report is given to the auction company driver on the scheduled pick up date. The auction manifest report will be signed by the Property and Evidence Services employee releasing the property and the driver for the auction company picking up the property.
   b. The first photocopy is attached to the outside of each assigned box where it can be clearly seen once all the property in the segregated box is tagged and confirmed.
   c. The second photocopy, obtained after the auction company driver signs the original, is retained in Property and Evidence Services.

6. Set the sealed boxes aside for pickup by the auction company.

7. Access EvidOnQ and enter the disposition of property:
   a. For example any items to be auctioned will be listed in the comments section of EvidOnQ.

8. Run serial numbers in the Automated Property System in RMS/CLETS.
   a. If any property is determined to be stolen, verify it was deemed as unclaimed before proceeding to sending the property to auction.

9. Notify the auction company for a scheduled pick up of property for auction.

10. Complete the EvidOnQ data entry after auction company picks up the property for auction by:
    a. Scanning the location bar code PROP.COM (which indicates the property went to auction).
    b. Scanning the bar code on the property pull list.
    c. Printing the downloaded information and verifying the printout and the auction manifest report labels match.

11. Place the auction manifest report into a file folder and place in a file pending receipt of the auction revenue.

I. AUCTION REVENUES

1. Upon receiving the auction revenue check, the following will be completed:
   a. Download and print a copy of the Summary Activity Report on PropertyRoom.com website.
   b. Verify the bar code on the Summary Activity Report matches the auction manifest report bar code. NOTE: Property items with one bar code may be separated by the auction company, but will retain the original bar code.

2. Make two copies of the auction revenue check.
a. The auction manifest report, Summary Activity Report, and a copy of the auction revenue check, are placed in the auction file and filed by date.

b. The second copy of the check is attached to the original auction revenue check.

3. The auction revenue check will be deposited according to the procedure found in Prop. 18 - Disposition of Unclaimed Money / Revenue Deposit Permits at the next deposit.

J. DESTRUCTION OF PROPERTY WITH NO VALUE

1. Property of little or no value should be rendered useless and can be disposed in the appropriate county dumpster or recycle bin.
   a. Paper should be shredded to prevent anyone from obtaining personal information for a fraudulent or illegal use.

2. Alcoholic beverages will be emptied and the containers will be disposed or recycled.

3. Knives unsuitable for auction or for department use, will be disposed with the firearms destruction.

4. Fireworks will be turned over to: Consolidated Fire, 2010 Geary Rd., Pleasant Hill, CA 94523 - Phone (925) 941-3330. Ask to speak to the Duty Investigator to arrange a pick up.

5. Counterfeit bills are sent to: U.S. Secret Service, Attn: Counterfeit Squad, 1700 Montgomery St., Suite 300, San Francisco, CA 94111-1024.

6. License plates / DMV placards are delivered to the local California DMV office.

7. Unclaimed U.S. Passports are sent to: U.S. Department of State, Consular Lost and Stolen Passport Unit (CLASP), CA/PPT/S/L/LE/CP, 44132 Mercure Circle, P.O. Box 1227, Sterling, VA 20166-1227.

8. Unclaimed FasTrak transponders are sent to: FasTrak Customer Service Center, P.O. Box 26927, San Francisco, CA 94126.

9. Mutilated Currency is sent to: Department of Treasury, Bureau of Engraving and Printing, MCD/OFM Room 344 A, P.O. Box 37048, Washington, DC 20013.

10. Unclaimed Social Security cards are sent to: Social Security Administration, P.O. Box 33008, Baltimore, MD 21290-3008.

11. Unclaimed U.S. Savings Bonds are sent to: Treasury Retail Securities Site, P.O. Box 214, Minneapolis, MN 55480-0214.

12. Unclaimed foreign passports or foreign ID cards are sent to the appropriate Consulates General or Embassy for the issuing country. Check the Internet for the updated contact information for either the Consulate General or the Embassy of the issuing country.

13. U.S. Flag in worn condition will be turned over to the local American Legion.

14. A transaction in EvidOnQ will be performed to indicate items destroyed by Property and Evidence Services employees. If another agency is handling the disposal, notate the name of the agency and the date the property was released for disposal.

K. RECYCLE / REUSE OF PROPERTY

1. Property, including but not limited to the following, may be recycled/re-used:
   a. Electronics (E-Waste) - currently the county uses Rapid Recycle, 110 Second, Ave South, Suite B-1, Pacheco, CA 94553 (925) 671-8008.
   b. Clothing / shoes - The (Juvenile) Hall Closet - 202 Glacier Dr., Martinez, CA 94553 (925) 957-2718.
   c. Metals (non-lethal) / Aluminum / Steel / Brass / Copper / Glass / Plastics for monetary compensation - Concord / Pleasant Hill Recycle Center - 1320 Galaxy Way, Concord, CA 94520.
   d. Paper / Cardboard - picked up by county Public Works.
      i. Cross shred papers are to be thrown in the trash due to restriction by County Public Works.
      ii. Strip shred papers can be given to County Public Works.
   e. Reading Glasses - Lions Club (check phone book for closest drop off center).
   f. Books - local Public Library.
   g. Triple Balance Beam Scales (clean) - donated to local schools at the discretion of the Director.
h. Plastics / Glass and other recyclable materials not for monetary compensation - local waste / recycle hauler contracted by Contra Costa County (currently Concord Disposal).
   i. Refer to Contra Costa County Waste Reduction and Recycling website for further recycle programs: http://www.co.contra-cost.ca.us/depart/cd/recycle
   ii. Recycling metal, aluminum, glass, plastic or other recyclable materials for revenue shall be collected until the volume justifies a delivery to the recycling facility.
      i. Any revenues earned must be properly receipted and deposited in the County General Fund.
      ii. Any recyclable property has to be property which, if not recycled, would be destroyed by placing in the trash.
      iii. Enter into EvidOnQ as destroyed.

L. PROPERTY RELEASED TO CHARITABLE ORGANIZATIONS
1. Property of value should be auctioned. However, 217 of the Welfare and Institutions Code allows property with a value of not more than $500 to be turned over to the County Probation Office, the Welfare Department, or any charitable or non-profit organization which is authorized to participate in a program or activity designed to prevent juvenile delinquency.
2. Property of value will be auctioned unless the Director authorizes specific items to be donated pursuant to 217 W&I.
3. Obtain a signature of the representative of the charity or organization.
   a. If the property is released to the Sheriff’s Charity, obtain a signature from the person receiving the property via EvidOnQ. Refer to Prop. 08 - Property and Evidence Release/Return.
   b. If the property is released to an agency or organization outside of the Office of the Sheriff:
      i. Obtain a signature from the representatives of the agency or organization on a document that lists the property in general (bikes, clothes, etc.).
4. The Property and Evidence Services employee handling the release should also sign and date the document.
5. File the document in the charity file folder.
6. Update EvidOnQ as charity.

M. PROPERTY CONVERTED TO DEPARTMENT USE
1. Property which is unclaimed, abandoned or declared a nuisance, may be retained by the Office of the Sheriff for official use. Sheriff's Policy 1.07.13 allows and controls conversion of property for official department use.
2. General Property for Department Use
a. The Property and Evidence Services employees will fill in the portions of the Property for Department Use form that asks for:
   i. Item Number
   ii. Description
   iii. Case Number
   iv. EvidOnQ Barcode

b. The requester will be given the Property for Department Use form to complete the following information:
   i. Division and unit
   ii. Location within the unit where the item(s) will be stored
   iii. Reason for use
   iv. Name of the person requesting the item(s)
   v. Requesting Division Captain signature and the date signed

c. Forward the signed Property for Department Use form to the Chief of Forensic Services for approval

d. Once approval from the Chief of Forensic Services is received, release of the property is as follows:
   i. Verify items to the list of property on the Property for Department Use form.
   ii. Obtain the signature of the person receiving the property and the date the property was released on the Property for Department Use form.
   iii. The Property and Evidence Services employee will sign and date the Property for Department Use form (under "person transferring property").
   iv. Update EvidOnQ with a transfer action of Dept Use and then list the date and location of the property in the comments area.
   v. File the Property for Department Use form in the filing cabinet according to unit location where the item is stored (example: Crime Lab, MCDF, Danville PD, etc.).

3. **Firearms for Department Use**
   a. If a firearm is classified as a nuisance (18275 P.C.) and with the approval of the court, the firearm may be used in carrying out the official duties of the law enforcement agency in lieu of destruction (34005(b) P.C.).

   b. Firearms for Department Use will be processed as follows:
i. Property and Evidence Services employee will fill out a Certification of Retention form with the following information:
   1. Make of firearm
   2. Model of firearm
   3. Caliber of firearm
   4. Serial number of firearm - if a serial number is not on the firearm, one must be assigned for tracking purposes (usually "CCCSO", the case number, and the Property and Evidence Services bar code number. Example: CCCSO 14-12345-30072041)
   5. Case number the firearm was stored under in the Property and Evidence Services facility.

ii. The requester must fill in:
   1. Date of the request
   2. Title/Rank and name of the requester
   3. Reason for use (must meet one of the pre-selected categories listed on the Certification of Retention form)

c. The Certificate of Retention must be authorized by:
   i. Division Captain of the requester AND
   ii. Chief of Forensic Services.

d. Final approval must be given by the Superior Court of California via:
   i. Superior Court Judge's signature and date
   ii. Superior Court Judge's printed name and department number of the Superior Court

e. The firearm will be entered into AFS as retained for official use.

f. EvidOnQ will follow Prop.08 - Property and Evidence Release/Return procedure with the location entered as Dept. Use. The comments field will be updated to show that the firearm is retained for department use.

N. PROPERTY FOR DISPOSAL FROM CONTRA COSTA COUNTY SUPERIOR COURT

1. Contra Costa Superior Court releases property that is no longer held as evidence to the Office of the Sheriff for disposal.

2. The property must have signed court orders authorizing the disposal.
3. Superior Court will notify Property and Evidence Services when property is ready for pick up.

4. Property from Superior Court will be handled as follows:
   a. The Property and Evidence Services employee assigned to pick up the property will meet with the court liaison (usually the Exhibit Clerk). A station house log is filled in by the court clerk submitting the property. It will include:
      i. Date the property was placed on the log for transport to Property and Evidence Services
      ii. Court location (Martinez, Walnut Creek, etc)
      iii. Docket number (in place of the case number)
      iv. Brief description of property
      v. Signature of the court liaison transferring the property
   b. Check the station house log to ensure all property is accounted for.
   c. The chain of custody on the packaging will be signed by court representative and Property Services employee.
   d. Any deficiency must be noted in the remarks column and the property rejected. Property and Evidence Services employees will not pursue the cause of a deficiency.
   e. Copies of court orders authorizing the disposal of the items will be submitted with property.

5. The Property and Evidence Services employee transporting the property will sign and date the bottom of the station house log in the box entitled "Property Received By" once all the property is received or rejected and notations made.
   a. The pink copy of the station house log is retained at the court.
   b. The white and the yellow copies are submitted with the property.
   c. The white copy is placed on the master station house log binder along with the copy of the court order and filed according to the date received in property.

6. Upon return to the Property and Evidence Services facility:
   a. The Property and Evidence Services employee will enter any new items into EvidOnQ. The court docket numbers will be used in lieu of case numbers when entering new property into EvidOnQ database. If the originating agency and originating agency case number is known, then it may be entered in the associated agency and cross reference # fields of EvidOnQ.
   b. The location assigned for these items will be "Dispo Area" as it is to be processed for disposal.
   c. Any returning items will be updated into EvidOnQ as a transfer without signature.
   d. Comments are noted in the NotesLog stating which court location, the court representative listed on the chain of custody and any other pertinent information regarding the item.
   e. No notifications will be sent to local law enforcement agencies due to the Superior Court already giving the proper notifications prior to pick up.

| Contra Costa County  
| Office of the Sheriff  
| FORENSIC SERVICES DIVISION  
| Property Services Manual | REVISION DATE: 3/16/2017 | NUMBER: PROP.11 - Automated Property System |
| APPROVED BY: Rich Wara & Pamela Hofsass | RELATED ORDERS: |
| CHAPTER: RMS | ASCLD-LAB: |
| SUBJECT: Automated Property System |
I. POLICY: Property and Evidence Services employees will abide by state and federal laws when returning firearms to individuals. Individuals prohibited from owning a firearm include persons convicted of felonies, certain misdemeanors, or persons prohibited due to court orders or restraining orders from owning, possessing or having control of firearms.

A. REFERENCES

1. Federal Law 18 U.S.C. 922 (g) - Prohibited person from possession of firearms and ammunition for conviction of crime of Domestic Violence

2. California Firearms Laws Summary 2016

B. GENERAL INFORMATION

1. A firearm will not be returned to any person prohibited by law or court order from possessing or owning a firearm.

2. If a person is eligible to possess a firearm see PROP. 13 - RELEASE OF FIREARMS for instructions regarding the return of firearms.

END OF DOCUMENT
I. POLICY: Property and Evidence Services employees will release firearms in accordance with the law and proper authorization or by court order. Found firearms may be released to a finder in accordance with the law.

A. REFERENCES

1. 18250 P.C. - Peace Officer to Take Temporary Custody of Firearm at Domestic Violence
2. 33850 P.C. - Return or Transfer of Firearm in Custody or Control of Court or of Law Enforcement
3. 1413 P.C. - Duties of Police Property Clerk
4. 16990 P.C. - Person Taking Possession of Firearm by Operation of Law
5. 18000-18010 P.C. - Control of Deadly Weapons / Surrender, Disposal, and Enjoining of Weapons Constituting a Nuisance
6. 29610-30165 P.C. - Special Firearms Rules Relating to Particular Persons (Firearms Prohibitions)
7. 25525 P.C. - Transportation Between Special Places
8. 33850-34000 P.C. - Obtaining Possession of Firearms in Control of Court or Law Enforcement Agency
9. 2080-2082 C.C. - Lost and Unclaimed Property
10. 6300-6389 F.C. - Protective Orders and other Domestic Violence Prevention Orders
11. 8102 W&I - Persons Held for Mental Examination / Law Enforcement Shall Retain Firearm

B. GENERAL INFORMATION

1. Domestic Violence /Mental Health Protective Orders on Firearm Returns

   a. Misdemeanor Complaints Unit compiles a firearms’ packet in the case of domestic violence or mental health protective orders to be presented to the Sheriff's Administration Officer (SAO). The SAO along with County Counsel is responsible for filing declarations with the court for the destruction of firearms seized pursuant to:

      i. 18250 P.C. (Domestic Violence).
      ii. 8102 W&I Code (Persons held for mental examination).

   b. After filing a declaration, a court order should be received within sixty (60) days directing the destruction and/or return of the firearm(s).

   c. Property and Evidence Services employees will receive court orders in a domestic violence or mental health examination(s) from the Professional Standards Unit.

   d. Family Code Section 6389 prohibits the possession or control of firearm(s) while subject to a protective order of the court.

      i. Family Code 6389 is a law independent from 18250 P.C. (Domestic Violence).

   e. A person that is subject to a protective order may not possess or own a firearm while under a protective order.

      i. The respondent must file a receipt showing the firearm(s) were surrendered to a local law enforcement agency or sold to a FFL (Federal Firearms Licensee) within 72 hours of the order.

      ii. Pursuant to P.C. 33850 Property and Evidence Services employees are not required to hold any firearms for a restraining order more than one year, unless the firearms are held as evidence, and then only until the case is adjudicated.
iii. When a case is adjudicated, then the process for return or destruction will commence.

f. If the owner is legally unable to retain a firearm, the owner has 180 days to become eligible or:
   i. Transfer the firearm to a family member who does not reside with the owner.
   ii. Transfer the firearm to a friend who does not reside with the owner.
   iii. Sell the firearm to a FFL.

g. Upon expiration of the protective order, any unclaimed firearm may be disposed of pursuant to 1413 (b) P.C.
   i. Property and Evidence Services employees may store the firearm(s) for one year. After the one year has passed, the firearm(s) can be declared a nuisance.

h. Any cases falling under the 18250 P.C. section will be stored for one year.
   i. The SAO is responsible for notifying Property and Evidence Services employees of any new court proceedings.

2. Nuisance Firearms
   a. Penal Code Section 18005 P.C. states that a firearm that has been stolen and later recovered from a thief or transferee or used in such a manner to constitute a nuisance, without knowledge of the owner, shall be returned to the lawful owner as soon as it is no longer required as evidence and the owner shows proof of ownership.
   b. A firearm may be destroyed after giving notice to the lawful owner. If there is no response from the lawful owner, then firearm becomes unclaimed.
   c. If a firearm is deemed illegal, then the Director, may make special arrangements for return of the firearm(s).

C. PROCEDURE
   1. Law enforcement agency or military institution firearms that are lost or stolen and are not considered evidence will be returned to the agency.

   2. For firearms that are not from a law enforcement agency or military institution, then:
      a. Review the authorization for completeness and accuracy from one of the following resources:
         i. Field Operations or assignee
         ii. Court Order
            1. A firearm with a court order cannot be returned until a DOJ authorization is received.
         iii. Teletype from another agency
         iv. SAO

      b. Query the Automated Firearms System (AFS) utilizing the California Law Enforcement Telecommunications System (CLETS) to ensure the firearm is not reported as lost or stolen.
         i. If the firearm is reported as stolen:
            1. Send a locate message (LG) or a cancel message (XG) in CLETS.
            2. Forward the firearm to the original reporting agency unless the stolen was out of Contra Costa County or a contract city, then notify the assigned detective.
         ii. If the firearm is not reported stolen then continue process.

      c. Send a letter to the owner stating the firearm may be claimed and include paperwork for the Law Enforcement Gun Release application (LEGR) as required by the State of California Department of Justice.
         i. The letter must state that the owner has 180 days to respond or the firearm will be destroyed.
         ii. For owners who reside outside of the State of California and are not prohibited from possessing a firearm, the firearm may be mailed to the local law enforcement agency where the owner resides or a FFL who is contracted to obtain the firearm on the owner's behalf. The owner must submit a LEGR application and be approved by the State of California Department of Justice before the firearm is returned. PROP.15 - Mailing of Firearms.
iii. Found firearms may be released to a "finder" according to 16990 P.C. and 2080 Civil Code if a Firearms Ownership Request is submitted and the conditions listed below are met.

d. After the LEGR application and the Firearm Ownership Request form have been submitted to and approved by the California Department of Justice and upon presentation of a valid Certificate of Eligibility (COE), Property and Evidence Services employees will:

i. Return the firearm to the owner listed on the letter upon verification of:

1. A valid and current identification presented by the owner/claimant.
2. The name of the person to whom the firearm is to be returned.
3. The person is not prohibited from possessing a firearm.
4. NOTE: The letter from DOJ is only good for 30 days from the date listed at the top of the letter. Anytime after the 30 days, the owner must resubmit a LEGR application and wait for the approval from DOJ in order to obtain the firearm.

ii. Copy the LEGR letter and give the copy to the owner while Property and Evidence Services employees retain the original with the gold seal.

iii. Return the firearm without ammunition.

1. At the option of the owner, the ammunition may be picked up within fourteen (14) business days after the date of pick up of the firearm or destroyed.
2. Active law enforcement officers are exempt and the ammunition may be returned along with the firearm(s).

iv. The owner will sign for the receipt of the firearm on the electronic signature pad for EvidenceOnQ database under Transfer with signature.

v. Advise the owner that a concealable firearm must be carried in a lockable container per PC 25610.

1. Offer the owner a "Project Child Safe" gun lock available at no cost.

e. Any documents presented to Property and Evidence Services employees in which the authenticity is questionable will be given to the Director and the firearm and/or ammunition will be held pending a review.

END OF DOCUMENT
# Firearms/Ammunition Destruction

**I. POLICY:** Upon receiving either a court order, approval from CCCSO Investigations detectives or the Director of Property and Evidence Services, firearms and ammunition will be disposed of in accordance with the law.

**A. REFERENCES**

1. **Penal Code**

3. **Welfare and Institutions Code**
   a. 8100-8103 W&I - Mental Health Firearms Prohibition

**B. GENERAL INFORMATION**
1. **Nuisance Firearms**
   a. Firearms deemed to be a public nuisance are defined as:
      i. Firearms possessed or owned in violation of 29800, 29900(a) or 29610 P.C.
      ii. Firearms used in the commission or attempted commission of any crime or offense by adults or juveniles 29300(a) P.C.
      iii. Domestic Violence (nuisance firearms):
          1. Firearms in evidence "for longer than 12 months and has not been recovered by the owner or person who had lawful possession at the time it was taken into custody, shall be considered a nuisance and destroyed as provided in subdivisions (a) and (b) of Section 18000 and subdivisions (a) and (b) of Section 18005."
          2. "If a firearm or other deadly weapon is not recovered within 12 months due to an extended hearing process as provided in Section 18420, it is not subject to destruction until the court issues a decision, and then only if the court does not order the return of the firearm or other deadly weapon to the owner."
      iv. A firearm owned by a person who committed the crime, which caused the weapon to become a nuisance, may be disposed of without notice being given to that owner.
      v. Nuisance firearms which are unclaimed or abandoned property and have been held for at least one year will be destroyed or retained for department use. For department use procedure refer to Property Manual Prop. 09: Property and Evidence Disposition, Section I.M.3 - Firearms for Department Use
   2. **Ammunition**
      a. Unclaimed ammunition accumulated in Property and Evidence Services will be:
         i. Released to Sheriff's personnel for test purposes, training or department use.
         ii. Disposed of in accordance with the law.
   3. Firearms may be sold only at the discretion of the Sheriff.
   4. Firearms shall be destroyed or converted to department use (specific firearms or non-serialized parts).
      a. Refer to Sheriff's Policy and Procedure Section 1.06.37 Property and Evidence Retention, Release and Disposition.
   5. A historical firearm may be transferred to a government owned/operated museum at the discretion of the Director.

C. **PROCEDURE**

1. **Firearms Destruction**
   a. Obtain a Firearms Pre-Destruction report.
   b. Check the location of the firearm in EvidenceOnQ.
   c. Run each firearm through CLETS. Check for stolen status.
      i. If insufficient information is available in EvidenceOnQ to run the firearm in CLETS then:
          1. Retrieve the firearm to obtain needed information.
          2. Record the necessary data in EvidenceOnQ.
          3. Re-check CLETS to determine if the firearm is stolen.
      ii. Attach a copy of the CLETS printout to the Firearms Pre-Destruction Report only if there is a "hit".
      iii. If the firearm is stolen refer the case to the original reporting agency, or the detective within the Investigations Division.
          1. A Locate (LG) or Cancel (XG) entry must be made in CLETS.
   iv. If the firearm is deemed stolen, eliminate the firearm from the firearms destruction.
   v. After determining the firearm is not stolen, continue with the process.
vi. If the owner of a stolen firearm authorizes the destruction of the firearm, add it to the firearms destruction and continue processing.

d. Retrieve the remaining firearms from their locations.
   i. Verify the model, serial number and other information against the Firearms Pre-Destruction Report.
   ii. Remove stocks and grips and place them in a box for auction.
   iii. Firearms are disassembled so they are inoperable and shall be placed in the assigned location (which currently is "Gun Store").

e. On the day of the firearms destruction:
   i. Remove the firearms from the Gun Storage Room and place them in the transport vehicle.
   ii. Transport firearms for destruction to the vendor with at least two witnesses from the Office of the Sheriff.
   iii. Witness the destruction of firearms.

f. After the firearms destruction:
   i. Transfer all firearms from the Firearms Pre Destruction report and generate a WEAPONS DESTRUCTION REPORT in EvidenceOnQ.
   ii. Witnesses to the firearms destruction will sign and date the WEAPONS DESTRUCTION REPORT.
   iii. The firearms destroyed shall be entered in CLETS.
      1. Make notes on the WEAPONS DESTRUCTION LIST indicating CLETS entries were made (FCN assigned to indicate the destruction).
   iv. File away the signed WEAPONS DESTRUCTION REPORT.

2. Ammunition Destruction
   a. Ammunition is pulled when proper authorization is received to destroy ammunition.
   b. The ammunition shall be placed in the Ammo Box location of the HAZMAT storage room.
      i. Ammunition, not retained for department use, will remain in the HAZMAT room until disposal.
   c. No ammunition for destruction will be given to outside law enforcement agencies unless authorized by the Director.
   d. Once the ammunition is destroyed, EvidenceOnQ will be updated with the date of disposal and transfer location to "Ammo DSY".

I. **POLICY:** The disposal of hazardous materials will be performed in compliance with local, state and federal regulations.

A. **REFERENCES:**
   1. Environmental Protection Agency (EPA) Code of Federal Regulations 261.5- Special requirements for hazardous waste generated by conditionally exempt small quantity generators.
   2. California Code of Regulation (CCR), Title 22, Division 4.5, Chapter 12, Article 3, Section 66262.34 - Accumulation Time.
   3. 11479.5 (e) H&S Code - Disposal of Hazardous Chemicals by Law Enforcement Agency.
   4. Forensic Services Division Policies:
      a. SAF.11 - Hazardous Communication Program.
      b. SAF.06 - Protective Clothing.
      c. SAF.21 - Hazardous Chemical Spill.

B. **GENERAL INFORMATION:**
   1. Hazardous materials must be handled with extreme care due to the potential of multiple hazards.
   2. Hazardous materials include, but are not limited to:
      a. automotive fluids (such as motor oil, antifreeze, transmission fluids, etc.)
      b. pesticides
      c. fertilizers
      d. paints
      e. household cleaning items (bleach, ammonia, chemical solvents, etc.)
      f. pool chemicals
   3. When disposing of hazardous materials, employees must wear lab coats, disposable gloves and if applicable, safety glasses.
   4. When hazardous materials are classified as waste and no longer required as evidence, then the waste must be disposed of within 90 days.
   5. Hazardous materials received from the Criminalistics Laboratory may have a Chemical Evidence Inventory (CEI) attached to the container.
      a. The Chemical Evidence Inventory lists the description of each item within the container and identifies the flammability and pH number of each enclosed item.
   6. Do not pull one item for destruction from a container housing many other items. Wait for the authority to destroy all the contents of the same container.
   7. Containers that have controlled substances without any hazardous material commingled within will not be disposed of with hazardous waste, but transferred to the narcotics/drug disposal.
C. PROCEDURE:

1. The disposal of hazardous materials will be as follows:
   a. Review the authorization for completeness and accuracy.
   b. Compare the property card with the authorization.
   c. Retrieve the hazardous materials from their storage location.
      i. Employees will wear appropriate PPE when handling the container of the hazardous materials.
   d. Verify the bar code and information on the container against the property card.
      i. If the information matches, the bar code is removed from the container, if possible and attached to
         the property card.
   e. The Chemical Evidence Inventory sheets will be:
      i. Removed from the container and the case number and bar code written on the CEI sheet.
      ii. The listed item(s) are checked off of the CEI sheet (per the information on the outside of the
          container).
          1. DO NOT OPEN THE CONTAINER to obtain information regarding the contents.
   f. Place the containers in a designated area inside the HAZMAT room until the hazardous waste hauler
      arrives.
   g. Return the CEI sheets and property cards to the office area.
   h. Call the hazardous waste hauler to schedule a date and time for pick up.

2. Transfer to Hazardous Waste Hauler:
   a. Escort and monitor the hazardous waste hauler as the items inside the containers are categorized in order to
      be transported to the disposal site.
      i. The hazardous waste hauler will use the facility loading dock to classify the hazardous waste.
      ii. The Property and Evidence Services facility EPA number is given to the hazardous waste hauler in
          order to provide the Uniform Hazardous Waste manifest.
          1. A copy of the signed EPA Form 8700-22 Uniform Hazardous Waste manifest is sent to:
             DTSC, P.O. Box 400, Sacramento, CA 95812.
   b. Copy and retain the documents generated by the hazardous waste hauler.
   c. Enter transactions into FileOnQ as "DSY".
   d. Mark the property cards "DSY" and the date of transfer to the hazardous waste hauler.
      i. File the property cards in the card file according to case number.
   e. Generate a chemical destruction report and file with the CEI sheets and documents from the hazardous
      waste hauler.
   f. Retain the manifest as a permanent record.

**ASCLD-LAB:**
Marijuana Drying

Marijuana Drying Procedure

APPROVED BY: Rich Wara & Pamela Hofsass
ASCLD-LAB:

CHAPTER: Marijuana Drying

SUBJECT: Marijuana Drying Procedure
I. Policy: Non-conforming work includes any aspect of testing or work product that does not conform to laboratory policies, procedures or the agreed requirements of the customer. When non-conforming work is encountered in Property and Evidence Services, action is taken to address the non-conformity or quality issue.

A. The appropriate corrective action taken is based on the type of non-conformity, the magnitude/scope of the problem, and whether the non-conformity was isolated or repetitive. When property staff become aware of non-conforming work they should notify their Director. See FSD.15 for more information about the evaluation of non-conforming work.

1. **Corrective Action (Most Significant):** Action taken to address a significant technical or quality issue. The non-conformity requires documentation of the corrective action per Division policy and procedure. See FSD.15 for more information.

2. **Level 2 Non-Conformity:** These incidents do not cause immediate concern for the quality system but may have an isolated effect, tend to be individual events, and are addressed on a case-by-case basis. These non-conformities have the potential to be re-mediated.
   
a. Level 2 non-conformities may include but are not limited to:
   
i. Not following current published Property Services or Division policies and procedures.
   
ii. Repeated Level 1 errors.
   
b. Documentation of a Level 2 non-conformity will be maintained within the unit and will be evaluated by the Director. The documentation should include, as applicable:
   
i. Describe the quality issue. **What is the problem (error or non-conformity)?**
   
ii. An explanation of how the quality issue occurred. **Why did it happen?**
   
iii. An explanation of the action taken to correct or improve the quality issue. **What was done to correct the problem?**
   
iv. An evaluation of the impact (if any) on casework, equipment, etc. **How significant is the problem?**
   
v. Notes for any monitoring or follow-up. **Was the correction effective?**

3. **Level 1 (Least Significant):** These incidents are unlikely to reoccur, are not systemic, and do not affect the fundamental reliability of the work product.
   
a. Level 1 non-conformities may include, but are not limited to:
   
i. Grammatical or Typographical Errors
   
ii. Correction of Chain of Custody
   
iii. Missing initials/date on evidence.
   
b. When brought to the staff's attention, this type of non-conformity is typically corrected immediately by the staff. A record of the correction should be captured by the staff's initials/date as outlined in Division Policy FSD.42.

END OF DOCUMENT
I. Policy: The following is a list of abbreviations approved for use in the Property and Evidence Services unit.

A. AGENCIES / DEPARTMENTS
   1. CSB - Custody Services Bureau
   2. DA - Office of the District Attorney, Contra Costa County
   3. DOJ - Department of Justice
   4. DTSC - Department of Toxic Substances Control
   5. EPA - Environmental Protection Agency
   6. FOB - Field Operations Bureau (Office of the Sheriff, Contra Costa County)

B. CODES
   1. C.C. - California Civil Code
   2. C.C.P. - Code of Civil Procedure
   3. C.C.R. - California Code of Regulation
   4. F.C. - California Family Code
   7. P.C. - California Penal Code
   8. W&I - California Welfare and Institutions Code

C. DATA SYSTEMS / TERMINOLOGY
   1. AFS - Automated Firearms System
      a. BBL - Barrel Length
      b. CAL - Caliber
      c. DOC - Document Code
      d. DOT - Date of Transaction
      e. MAK - Make (brand name)
      f. TYP - Type (of firearm)
   2. APS - Automated Property System
      a. BRA - Brand
   3. ARS - Automated Reporting System
   4. CLETS - California Law Enforcement Telecommunications System
   5. DOB - Date of Birth
   6. DOI - Date of Incident
7. FCN - File Control Number
8. MOD - Model
9. MIS - Miscellaneous
10. NCIC - National Crime Information Center
11. OAN - Owner Applied Number
12. OCA - Originating Case Agency (case file number or reference number)
13. ORI - Originating Agency Identifier
14. RMS - Records Management System
15. SER - Serial Number
16. XFR - Cross Reference Case Number

D. PACKAGING
1. BPB - Brown Paper Bag
2. CASE - Gun Case (hard or soft type)
3. CSE - Controlled Substance Envelope
4. LBEK - Liquid Blood Evidence Kit
5. ME - Manilla Envelope
6. PAP - Paper wrapping (butcher type paper)
7. PB or PBAG - Plastic Bag
8. SAEK - Sexual Assault Evidence Kit
9. TSCSE - Tape Sealed Controlled Substance Envelope
10. WB - White Box (cardboard)
11. WE - White Envelope
12. ZL - Ziplock
13. ZLPB - Ziplock Plastic Bag

E. MISCELLANEOUS
1. CEI - Chemical Evidence Inventory
2. COE - Certificate of Eligibility (for Firearms)
3. DROS - Dealer's Record of Sale
4. E Room - Explosives Room / Hazmat Room
5. E Waste - Electronic Waste
6. FFL - Federal Firearms License (or Licensee)
7. LEGRA - Law Enforcement Gun Release Application
8. O Room - Outside Container
9. PPE - Personal Protective Equipment
10. SAO - Sheriff's Administrative Officer (Contra Costa County)
11. SAVES - Sheriff's All Volunteer Extended Services (Contra Costa County)
12. TBF - To Be Fixed
13. TRO - Temporary Restraining Order
14. UTL - Unable To Locate

END OF DOCUMENT
I. POLICY: Evidence leaving the custody of Property and Evidence Services for viewing or inspection purposes must be properly documented to protect the integrity and chain of custody of the evidence.

A. Definitions

1. **Viewing** - When a piece of evidence is checked-out for the purpose of being opened such that the contents can be taken out to be viewed or photographed.

2. **Inspection** - When a piece of evidence is checked-out for the purpose of inspecting the outside packaging/container (eg. checking the chain of evidence, tape seal, etc.).

B. General Information

1. Evidence leaving the custody of Property and Evidence Services must be documented and signed for in EvidenceOnQ using the signature pad to capture signatures in the electronic chain of custody.

2. For viewing and inspections, the evidence is to be handled as a release (refer to PROP.08 - Property and Evidence Release/Return).

3. The DA, SO Investigations, or Crime Lab may check-out evidence.
   a. Other agencies (eg. the Public Defender or private attorney) may only check-out evidence **with a court order and an agreement with the DA's Office**.

C. Responsibilities

1. Property will not be responsible for any viewings or inspections.

D. Process

1. Property Services staff will determine if the evidence being checked-out for a viewing or an inspection of the package.

2. Property Services staff will ask the recipient if the viewing will take place at an offsite location or at the Property Services facility.
   a. Property Services may facilitate the viewing process at the Property Services facility by supplying butcher paper, packaging tape, scissors, pens, gloves, or other requested material

3. Property Services staff will instruct the person signing for evidence to make sure all viewed evidence is tape sealed, dated and initialed before return.

4. Upon return, Property Services staff will inspect and confirm that all packages are properly tape sealed.

5. Any discrepancies will be brought to the attention of the director.

END OF DOCUMENT
### Forensic Services Division

#### Safety Manual

**Introduction**

I. All laboratory employees will work with and around chemicals in a safe and conscientious manner to minimize potential hazards to themselves and their fellow employees.

   A. Those who are unsure of the proper safety measures to employ will consult with their supervisor and/or the appropriate safety literature, including Safety Data Sheets before using the chemicals in question.

II. All employees share the responsibility for safety by complying with these regulations and by bringing any situations which appear to be unsafe to the attention of their supervisors.

   A. Employees can bring their concerns to their immediate supervisors by notifying them verbally or in writing.

III. Separate policies have been written to address the unique safety problems and solutions for each of these types of hazards.

   A. Explosive and Reactive Chemicals
   
   B. Flammable Chemicals
   
   C. Toxic Chemicals
   
   D. Corrosive Chemicals

IV. Certain safety precautions are common to all types of hazardous chemicals. These precautions must be extended to all chemicals, not just those designated as hazardous by state or federal regulations.

   A. For many chemicals, the degree of hazard is still unknown, and they must be treated as hazardous until proven otherwise.

   B. State and Federal regulations have placed the burden on the manufacturers of chemicals to inform users of the safe handling practices for their products. This information is contained in Safety Data Sheets or CHRIS Manuals.

   C. The chemicals used by the Forensic Services Division generally constitute four types of hazards:

      1. Fire hazard from chemicals, which are especially flammable.
      2. Reactive hazard from chemicals, which are capable of explosive reactions or uncontrolled reactions with other chemicals.
      3. Physical destruction of tissue from chemicals which are corrosive when in contact with the body.
4. Toxicity from chemicals, which repair or destroy normal body functions through chemical interaction with tissues. Toxic chemicals include carcinogens, poisons, mutagens and teratogens.

V. The following personal precautions should be followed by all personnel:

A. No eating, drinking, or smoking is allowed in any area of the laboratory or crime scene where chemicals are stored or used. This will reduce the chance of accidental ingestion of chemicals and eliminate one source of ignition.

B. Food and beverages for personal consumption must never be stored in any refrigerator designated for evidence and/or chemical storage.

C. Employees should make every effort to wash their hands frequently, especially whenever they leave the laboratory area, whenever they complete a task associated with chemicals, or before they eat, drink or smoke.

D. Employees should be cautious of and attempt to curb habits, such as placing pens or pencils in their mouths or touching their faces, which will inadvertently expose them to hazardous materials.

VI. Employees should follow these guidelines for the isolation of hazards:

A. Employees must use caution in order to avoid exposing fellow workers to chemical hazards. Any employee using hazardous chemicals where another employee may be exposed must advise him or her of such use.

B. Whenever possible, separate tasks to avoid contaminating another employee, his/her work area, or equipment.

C. Cover containers when practical to avoid release of a harmful agent into the air.
   1. Always use caps on tubes when centrifuging or vortexing.
   2. Replace rubber bulbs on dropper bottles whenever they show signs of deterioration to minimize escape of vapors.
   3. Dropper bottles, which are used infrequently, should be checked periodically.

D. When hazardous evidence or chemicals are taken to non-laboratory areas, proper precautions must be observed to prevent the exposure of others. In non-laboratory areas, the following safety precautions must be observed:
   1. Place paper or plastic over the surface on which evidence or chemicals are to be laid out, even though chemicals are in closed containers.
   2. Never open volatile, hazardous material in non-laboratory areas. This should be done in a fume hood. Closed containers may be examined, but still require precautions because of residues which may be on the outside.
   3. Advise others in the area of the presence of hazardous materials.
   4. Provide gloves and laboratory coats to those potentially exposed by handling the hazardous material or container
      a. Protective respiratory equipment cannot be provided to non-laboratory individuals. Therefore, any evidence or chemical, which poses a hazard through inhalation, cannot be opened for examination outside of a fume hood.
   5. Clean the surface after the evidence, chemical, paper, or plastic has been removed.
6. Hazardous items brought into non-laboratory areas which will not be examined, such as when they are to be signed out, must be in clean packaging as well as closed containers.

7. If hazardous chemicals must be left unattended, such as when a sample is being evaporated in a fume hood, it must always be labeled to alert others to the presence of a hazard.

8. Papers treated with chemicals must never be stored with case notes in report files.

END OF DOCUMENT
I. The following defines the roles and responsibilities of the staff involved in the health and safety program.

A. The Chief of Forensic Services is responsible for:
   1. Developing and updating the policies and procedures for the Forensic Services Division Safety Program.
   2. Ensuring that all employees in the Division adhere to all State and Federal safety Regulations.
   3. Ensuring that the employees have the necessary resources for meeting the goals of the Division Safety Manual.

B. Each Section Manager is the Safety Coordinator for their respective Section. See FSD.08, and is responsible for:
   1. Ensuring the health and safety procedures are being followed by all staff.
   3. Providing personal protective equipment that is in working order.
   4. Ensuring that no employee is assigned a task without proper safety training.
   5. Preventing exposure by controlling workplace hazards using a number of different methods such as through work practices, administrative controls, engineering controls, and personal protective equipment.
   6. Monitoring of the Division's health and safety program.
   7. Overseeing the annual review of the health and safety program.
   8. Review the physical plant and operational safety requirements throughout their Section.
   9. Suggesting changes to the Safety Manual based on suggestions from staff, review of the safety program and safety audits.
   10. Ensuring compliance with applicable regulatory programs external to the Laboratory under the direction of the Office of the Sheriff, if applicable.

C. Supervisors are responsible for:
   1. Ensuring the health and safety procedures are being followed by all staff.
2. Implementing the Safety Manual
3. Providing personal protective equipment that is in working order
4. Ensuring that no employee is assigned a task without proper safety training.
5. Preventing exposure by controlling workplace hazards using a number or different methods such as through work practices, administrative controls, engineering controls, and personal protective equipment

D. All Division Employees are responsible for:

1. Considering their own safety and that of his/her colleagues at all times.
2. Being familiar with the safety practices and potential hazards associated with equipment.
3. Being familiar with Safety Data Sheets.
4. Recognizing that all chemicals should be considered hazardous and should be handled with care.
5. Reporting any potentially hazardous situations to their Safety Coordinator and Supervisor
6. Asking their Safety Coordinator or their Supervisor if they are unsure of a hazard or safety procedure.

E. Employees of the Division working with or around chemical and biological materials are responsible for exercising caution and handling hazardous materials in a safe manner.

END OF DOCUMENT
I. Each Division Facility will be inspected at least bi-annually by the Safety Coordinator or
designee to ensure compliance with state and local fire and safety codes.

A. The purpose of conducting inspections is to determine whether or not the safety practices
set forth in the Division Safety Manual are being followed.

B. For the bi-annual safety inspection check of each facility, refer to appropriate checklist:
   1. For the Criminalistics Laboratory, see SAFF.04.01.
   2. For the Drugs, Alcohol and Toxicology Laboratory see, SAFF.04.02.

C. For the monthly/weekly safety inspection checks of each facility, refer to appropriate
   checklist:
   1. For the Criminalistics Laboratory, see SAFF.04.03.
   2. For the Drugs, Alcohol and Toxicology Laboratory, see SAFF.04.04.

D. Any conflicts with safety policies or procedures and safety concerns will be communicated
to the Supervisor or Safety Coordinator in writing.

E. These inspections may not reveal all safety problems. Therefore, employees are
   responsible for informing their supervisors of any safety problems which they encounter.
   Staff can notify their Supervisor or Safety Coordinator of any safety concerns they may
   have.

END OF DOCUMENT
To prevent unnecessary exposure to hazardous materials, laboratory fume hoods have been installed or placed in the laboratory.

A. Fume hoods containing chemicals or evidence are to be left on at all times except when necessary to shutdown for servicing.

B. Fume hoods must generate a minimum average face velocity of 100 linear feet per minute for use with hazardous chemicals. If the sash must be partially down to generate the minimum face velocity, this position is marked on the outside of the fume hood. The sash must be no higher than this level whenever chemicals are used or placed in the hood.

C. Hoods, which are equipped with velocimeters, must be checked before each use to ensure proper ventilation rates. All laboratory fume hoods are to be checked annually by an ISO/IEC 17025:2005 Accredited Vendor or equivalent to ensure that proper face velocities are maintained.

D. The movement of people past a fume hood can create eddy currents, which reduce the effectiveness of the hood. All employees are asked to avoid unnecessary movement past fume hoods when someone is working in one.

E. The most effective area of the fume hood for drawing away vapors is at the back. This is where chemicals or evidence should be placed, whenever possible.

F. The minimum amount of chemicals should be stored in the fume hoods. Only those, which are used in a fume hood regularly, should be kept there.
I. All laboratory employees will wear the protective clothing appropriate for the potential hazard involved in a task in order to minimize the exposure or risk for the employee and others. This policy describes the appropriate use of protective clothing to enhance employee safety. For information on other protective equipment, refer SAF.07 Eye and Face Protection, SAF.08 Respiratory Protection, and SAF.09 Noise Protection.

A. In any forensic laboratory, the variety of the evidence encountered and the analytical procedures utilized pose potential safety hazards of many types. Hazards encountered include:

1. Infectious agents from liquid and dried biological samples
2. Chemicals, either as evidence or reagents, which may be carcinogenic, mutagenic, corrosive, flammable, poisonous, or otherwise toxic or harmful.

B. The routes by which a laboratory employee may be placed at risk vary. Exposure may occur through:

1. **Inhalation.** Infectious agents, chemicals, and radioactive materials can become airborne and subsequently inhaled or absorbed into the system.
2. **Direct contact.** Many chemicals in particular may be absorbed directly through the skin. Any open wounds or cuts may also provide a route of entry for infectious agents or chemicals which otherwise may not be absorbed. In addition, if direct contact is made with some mucous membranes or the eyes, harmful agents which would otherwise not be absorbed or absorbed in lesser amounts may pass into the body.
3. **Indirect contact.** Infectious or other harmful agents may also be introduced into the body through secondary routes, usually involving the hands. Anything which comes into contact with evidence or reagents, such as work surfaces, hands, apparel, pens, paperwork, and packaging, may be contaminated with a harmful agent. The employee may then be exposed by inhalation or absorption resulting from these secondary sources. Of particular concern is the transfer of harmful agents by the hands through ingestion when the employee eats or drinks or touches his/her face without first washing his/her hands.

C. The proper clothing can be an effective barrier in preventing direct or indirect contact with harmful agents when used properly. The laboratory provides several types of garments for use by employees: laboratory coats, aprons and gloves. The use of each is discussed below.

1. **Laboratory coats** are the most common form of protection. They will provide a physical barrier which prevents harmful agents from collecting on the employee's
clothing. Laboratory coats must be isolated from non-contaminated areas.

a. Employees working in the and Drug, Alcohol and Toxicology Section must wear laboratory coats in the laboratory at all times.

b. Employees in the Criminalistics Section must wear laboratory coats when performing work in the laboratory.

c. Staff members briefly entering the laboratory, are not required to wear laboratory coats as long as they are not using chemicals or dealing with biohazard substances. Example: Clerical Staff.

d. The following applies to all Division staff employees:

i. When leaving the laboratory area, the employee shall leave his/her laboratory coat in the examination area on the wardrobe hooks.

ii. Drug, Alcohol and Toxicology Section staff accepting evidence in the front office area may choose to wear "office designated" coats, such as the blue lab coats. Criminalistics Section staff accepting evidence in the front office/reception may choose to wear assigned white laboratory coats.

iii. Laboratory coats, which have been worn in the evidence examination areas, must not be worn in the vehicles other than the scene vehicles.

iv. Used laboratory coats are laundered by a commercial laundry service.

1. Laboratory coats awaiting laundry pick-up are placed in the laundry bag/hamper in the laboratory area.

2. Laboratory coats soiled with potential bio-hazards (e.g. blood) will be placed into a red dissolvable bag supplied by the laundry service provider prior to being placed into the laundry bag/hamper.

2. Neoprene aprons are impermeable to most chemicals during short exposures. They will provide the employee protection against the splashing or spilling of harmful chemicals which laboratory coats will not provide.

a. Aprons must be worn by employees whenever the task involved exposes the employee to a reasonable potential for spilling or splashing harmful chemicals on himself or herself.

i. Examples would include the cleaning of glassware with a chromic acid mixture or mixing batches of harmful chemicals. The mixing or pouring of small quantities (less than 100 milliliters) ordinarily does not pose a great risk and a laboratory coat may provide sufficient protection as long as care is taken.

3. Protective gloves in combination with frequent hand washing can greatly reduce exposure to infectious agents and harmful chemicals. The hands often are the greatest source of exposure for many laboratory employees especially of infectious agents.

a. Gloves for infectious agents:

i. Very thin and flexible latex or nitrile gloves will provide adequate protection against infectious agents with minimal loss of dexterity.
However, they will not protect the employee against punctures from needles.

ii. Latex or nitrile gloves must be worn whenever either dried or liquid physiological fluids are handled or during the collection of evidence from or handling of dead bodies. Double gloving is recommended.

iii. The gloves must be removed and discarded before answering the telephone or leaving the laboratory examination areas.

iv. A fresh pair of gloves should be used each time they are donned to minimize the potential transfer of infectious agents to the hands.

b. Gloves for chemical protection:

i. As with protective clothing, the extent of protection against chemicals is related to the nature of the chemical, the thickness, structure, and composition of the glove, and the intensity and duration of the exposure. The proper glove must be selected for the chemical involved. Consult Safety Data Sheets for the chemicals in question to determine the appropriate type of glove. For most organic and corrosive chemicals, Neoprene or Nitrile gloves are sufficient if they are heavy enough. A notable exception is that PVA gloves should be worn with benzene.

ii. The appropriate protective gloves must be worn whenever hazardous chemicals are handled. Hazardous chemicals are those which are toxic, carcinogenic, mutagenic, corrosive, or for which the hazards are unknown. Situations requiring the use of gloves include:

1. Analyzing drug evidence
2. Making reagents
3. Sampling chemicals from a container or transferring chemicals to another container (with the exception of non-hazardous chemicals).

iii. Gloves used in the laboratory for chemical protection should be discarded if chemicals are spilled on them.

4. Foot Protection minimize the hazard to feet from chemicals, infectious agents, and falling objects while maintaining comfort, the following guidelines have been developed for protective foot wear.

a. Protection in the Laboratory:

i. Woven, cloth, and porous leather shoes can absorb chemicals and increase the exposure to the employee especially after a spillage. This includes canvas tennis shoes, most athletic shoes, and suede shoes. Consequently, these as well as sandals or open-toed/open-strapped shoes, which provide no protection, are NOT permitted to be worn by employees working at tasks involving chemical or physical hazards (such as the use of sharp scalpels) in the examination areas of laboratory.

ii. The ideal shoe is a closed one which is made of an impervious, synthetic material. Also acceptable are leather shoes which have been polished or treated to minimize the susceptibility to chemicals.
iii. Employees who do not care for the look of the safer shoes may wish to wear dress shoes to work and change into another pair for working in the laboratory.

END OF DOCUMENT
I. Laboratory employees will use the appropriate eye or face protection whenever there is a reasonable expectation that an injury to the eyes or face could result from the task being performed.

A. Injuries or hazards to the face and/or eyes consist of four general types:

1. Infectious hazards - the membranes of the eyes provide a potential route of entry for infectious agents into the body. The splashing of liquid blood into the eyes, in particular, can cause an infection in the individual.

2. Chemical hazards - splashing a corrosive chemical on the face or in the eyes, can cause blindness or disfiguring injuries. In addition, toxic vapors can enter the body more readily through the eyes than through the skin.

3. Physical injuries - activities such as test firing a weapon may increase the possibility that an object will be propelled into the face or eyes.

4. Radiation injuries - exposure to ultraviolet light can cause cumulative, irreversible injury to the eyes. Even reflected light can cause eye damage.

B. Employees must protect themselves whenever performing tasks where there is reason to believe such injuries may occur (whether in the laboratory, at a scene, or attending a training class) by using the proper eye and face protection. This policy applies even if the employee is performing a task for which eye or face protection has not specifically been required. A list of when eye and face protection requirements and guidelines are listed below:

1. When performing tasks where corrosive or very toxic chemicals may splash, a full face shield or goggles must be worn. Glasses will not prevent chemicals from reaching the eyes.

2. When test firing weapons or when practicing or qualifying with a firearm as required by the Department, safety glasses or goggles must be worn.

3. Glasses or goggles must be worn when handling more than a few drops of liquid blood. Regular prescription lenses will suffice for this purpose. As an alternative, blood samples may be handled in a fume hood with the sash lowered to protect the face. If the blood is being splashed to create blood spatter, goggles must be worn.

4. Employees wearing contact lenses shall observe the same eye protection as noted above.

5. Approved light filtering glasses must be worn by any employee who may be exposed to ultraviolet light or when burning magnesium ribbon.
6. Distillation apparatus, which is in use, must be placed behind a safety shield or in a fume hood with the sash lowered.

7. Safety glasses or goggles are required when working with glassware which is under vacuum or under a fume hood with the sash lowered.

8. If prescription glasses worn in the laboratory examination area by employees are not safety glasses, the employee must use safety goggles over his/her glasses or change to safety glasses whenever they are required by this policy.

9. The proper eye or face protection will also be made available to any authorized laboratory visitor who is exposed to the above conditions.

C. Employees can obtain eye and face protection in the following ways:

1. All necessary, non-prescription eye and face protection devices are provided by the County at no cost to the employee.

2. The County will reimburse an employee for all or part of the cost to obtain prescription safety glasses if he or she works with any of the eye hazards described above.

3. If the proper eye or face protection is not available, the employee must bring it to the immediate attention of his or her supervisor.

END OF DOCUMENT
I. Purpose:

A. Respiratory protection is required whenever an employee is likely to be exposed to air contaminants such as hazardous chemicals, dusts, mists, fumes, vapors, or aerosols in concentrations which exceed statutory or recommended limits and when current administrative or engineering controls are not effective. Respiratory protection is also required to prevent exposures to aerosol-transmissible diseases and zoonotic diseases.

B. The intent of this policy is to ensure compliance with the California statutes and California Occupational Safety and Health Administration (CAL/OSHA) regulations. CAL/OSHA regulates:
   1. When respiratory protection shall be used by employees on the job
   2. The types of respiratory protection equipment which may be used
   3. Medical evaluations for employees required to use respirators
   4. Training and fit testing of employees on respiratory protection

C. Respiratory protection devices are intended to be used only when engineering controls or other administrative procedures cannot provide sufficient protection to the employee. Whenever possible, it is preferable to limit or reduce the exposure to the employee than rely on respirators. Engineering controls include the use of proper ventilation, or the use of fume hoods. Administrative controls include elimination of exposure to toxic chemicals, substitution with less hazardous materials, or reducing the amount of time an employee is exposed.

D. Forensic Services Division provides two types of respirators for use when respiratory protection is required to limit employee exposures to harmful gases, mists, dusts, aerosols, aerosol-transmittable diseases, and zoonotic diseases:
   1. Full face, air-purifying respirators using disposable cartridges. The department provides 3M 7800 full face respirators unless a different make or model is issued on a case by case basis.
   2. Disposable dust/mist single use air purifying respirators. The department provides 3M N95 9210+/37192* and 9211/37193 respirators unless a different make or model
is issued on a case by case basis.

II. Medical Evaluations

A. Only persons who have been medically evaluated, trained in the use of the devices and fit tested may use respirators.

B. Any Forensic Services Division employee using an approved respiratory device must first have received medical evaluation, training, and fit testing specifically for the type of device being used.

1. All employees must complete a medical evaluation through a health questionnaire and/or medical examination before fit testing and wearing a respirator.

   a. The Medical Evaluation Questionnaire is SAFF.08 or electronic equivalent.

   b. The extent of the medical screen is decided by a physician in the County Health Department based on the type of respirator which is to be used. It may be as simple as a questionnaire or it may include a physical examination, laboratory tests, and respiratory capacity tests.

   c. An employee may receive medical approval for one type of respirator but not another.

III. Respirator Selection and Use

A. Only respiratory devices which have been approved by the National Institute for Occupational Safety and Health (NIOSH) or the Mine Safety and Health Administration (MSHA) may be used by staff for protection from toxic substances or biological hazards. Approved devices are marked by the manufacturer to indicate their approval status.

B. Employees must use respiratory devices provided for them by the County. No employee may provide his or her own device.

C. Respiratory protection may not be provided to laboratory visitors or maintenance personnel.

D. Employees will use the Respirator/Cartridge Selection and Change Out Schedule to determine the appropriate selection of respiratory protection based on the chemical/material exposure, the duration of use, and environmental factors.

   1. The Respirator and Cartridge Selection and Change out Schedule is based on data gathered from chemical Safety Data Sheets (SDS), air monitoring data, and industry standards/best practices.

   2. The respirators covered in this program and in the selection and change out schedule are not designed for responding to large scale spills (exceeding 5 Liters), emergency cleanup, and fire response. County HazMat and/or Fire should be contacted for these situations.

   3. The respirator selection and change out schedule is designed to cover exposures where employees are using limited quantities of materials in areas indoor and
outdoors that have reasonable ventilation available. Where large amounts of chemicals are used over a large surface area and there is little ventilation available, employees should stop the work and evaluate appropriate respiratory protection.

E. Disposable Dust/Mist Single Use Air Purifying Respirators

1. Must be used to control exposures to bloodborne pathogens, aerosol-transmittable diseases, and zoonotic diseases. For example:
   a. Whenever an employee handles open containers of liquid blood or when evidence is handled in such a way that liquid or dried blood is likely to become airborne.
   b. When an employee enters or conducts work in an abandoned or little-used rural facility that may harbor zoonotic diseases.
   c. When an employee enters or conducts work in an animal operations facility.
   d. When an employee enters a crime scene where the occupant has an aerosol-transmittable disease such as Tuberculosis or H1N1 flu virus.

2. Must be used to limit exposure to particulate material such as fingerprint powder and chemical component dusts.

3. These masks must never be used to control exposure to toxic fumes or vapors.

4. Dust/mist single use air purifying respirators shall be discarded or replaced after each day that they are used or if the employee notices increased breathing resistance while using them.

F. Full Face, Air-Purifying Respirators

1. Are intended to reduce exposure to dusts, gases, mists, vapors, fumes and aerosols.

2. Must not be used in immediately dangerous to life and health (IDLH) atmospheres that contain high or unknown concentrations of chemicals and/or oxygen deficient environments.

3. Contact lenses may be worn with a full face respirator.

4. Respirator and Cartridge Selection and Change-out Schedule
   a. For all users of full-face air purifying respirators, a filter cartridge replacement (change-out) schedule was implemented to prevent employee exposures.
   b. Full-face respirator cartridge filters shall be changed after each use, or sooner if there is breakthrough or resistance in breathing detected.
   c. Full-face respirator cartridges should only be replaced with a new cartridge removed from a sealed container.
d. Used cartridges should be disposed of properly as laboratory waste at the completion of work activity.

G. Inspection and Maintenance of Respirators

1. Inspection
   a. The employee shall inspect their respirator before and after each use.
   b. Respirator inspection shall include a check of the tightness of connections and the condition of the face piece, headbands, valves, connecting tube, and appurtenances. Rubber or elastomer parts shall be inspected for pliability and signs of deterioration.

2. Cleaning and Sanitizing and Disposal
   a. Routinely used respirators shall be cleaned and disinfected after each use to ensure that proper protection is provided for the wearer.
   b. Dedicated cleaning materials shall be kept in each area where respirators are used. Supervisors/Managers will ensure that cleaning materials are available.
   c. The following procedure shall be used for thorough cleaning and disinfection of full-face respirators:
      i. Remove and dispose of any used cartridges.
      ii. Wash face-piece with provided cleaning solution and/or disinfectant pads. Use a soft bristle brush to facilitate removal of dirt, if necessary.
      iii. Rinse completely in clean, warm (not hot) water.
      iv. Air dry the respirator in an area away from contaminants.
      v. Clean other respirator parts as recommended by the manufacturer.
      vi. Inspect valves, head-straps, and other parts; if needed, replace with new parts obtained from the Supervisor/Manager.
      vii. Place in a sealable plastic bag or container for storage.
   d. N-95 respirators are to be disposed of in an appropriate manner and will not be cleaned.

3. Repair:
   a. Respirator problems, repairs or replacements should be discussed with the employee's Supervisor/Manager.
   b. Only manufacturer NIOSH-approved parts will be used for replacement.
   c. Depending on the type of repair, a technician trained by the manufacturer may be required to perform the repairs. Refer to the manufacturer's specifications.
4. **Storage:**
   a. After inspection, cleaning, and necessary repair, respirators shall be stored to protect against dust, sunlight, heat, extreme cold, excessive moisture or damaging chemicals. Normally, storage in "zip-lock" plastic bags is adequate.
   
   b. Respirators should be packed or stored so that the face-piece and exhalation valve will rest in a normal position and function will not be impaired by the elastic belt settings in an abnormal position.
   
   c. Respirators should not be stored in vehicle trunks, or any other environment subject to high temperature fluctuations, as this will rapidly degrade the effectiveness of the equipment.

IV. **Respiratory Protection Training:**

A. Once a medical evaluation is conducted and clearance to use a respirator is provided, fit testing can be conducted. Respiratory Protection training and fit testing must be preceded by a medical evaluation.

B. Only employees who have passed the medical evaluation for a particular respirator may be fit tested and approved to use that respirator.

C. Respiratory Protection Training is conducted annually and includes:
   1. Instruction on the nature, extent and effects of respiratory hazards to which the employee may be exposed.
   2. Explanation of engineering and/or administrative controls and the specific procedures developed for the operations being conducted.
   3. Discussion of the proper circumstances for use of the respirator and its limitations
   4. How to put on the respirator
   5. How to verify the proper fit
   6. How to care for the respirator after use, and precautions to observe with the respirator.
   7. General requirements of the Respiratory Protection Standard (CCR Title 8).

V. **Fit Testing of the Respirator Mask to Face Seal**

A. Qualitative or Quantitative Fit Testing for employees who are required to use a respirator shall be conducted annually.

B. Employees with an inability to detect chemicals by odor or taste will be quantitatively fit tested.
C. Face Piece Seal Protection is required to ensure that the respirator is properly sealed to prevent exposures. Facial hair that interferes with the respirator sealing surface or proper valve function is not allowed. Employees should be clean shaven in the areas where the respirator seals to the skin.

D. Positive and Negative User Seal Checks are used to ensure the proper fit in the field and during fit testing, employees should perform the following positive and negative user seal checks each time they don the respirator:

1. To assure proper protection, the employee shall perform the following checks each time before using the full-face respirator:

2. Negative Pressure Test - Cover both cartridges with the palms of your hands. Inhale gently so that a vacuum occurs within the facepiece. Hold your breath for 10 seconds. If the vacuum remains, and no inward leakage is detected, the respirator is properly fit.

3. Positive Pressure Test - Block exhalation valve with your hand. Breathe out gently into the mask and check for leakage. Air will escape if there are face seal gaps or malfunctioning valves.

4. If leakage is detected during either the positive or negative pressure test, the respirator straps should be readjusted and the pressure tests repeated.

VI. Workplace Exposure Monitoring

A. Workplace exposure assessments shall be performed, as needed, to identify harmful airborne contaminants, their extent and magnitude, and suitable control measures to eliminate them.

B. Additional assessments shall be conducted whenever potential exposures change due to new materials, process or equipment changes, or other conditions that might increase employee exposures are present. Exposure assessments may be conducted by Forensic Services, the Office of the Sheriff, Risk Management and/or the County Hazardous Materials Unit.

C. Results of work area/employee exposure monitoring may be summarized and kept in the Division Safety File. Alternately, the County Risk Management Department may maintain records associated with the workplace exposure monitoring.

D. In areas where respirators are required to be worn routinely, workplace exposure assessments and/or monitoring shall be performed when significant changes in processes or operations occur.

E. Results of all exposure monitoring of employees shall be maintained for as long as the employee remains with the Office of the Sheriff plus a minimum of 30 years after the employee terminates employment.

VII. Program Assessment
A. This program will be assessed and updated, if needed, on an annual basis.

VIII. Record Keeping

A. The Safety Coordinator of the Criminalistics Section may maintain records associated with the Respiratory Protection Program, to evaluate the performance of the Program and to satisfy regulatory requirements. Alternately, the County Risk Management Department may maintain records associated with the Respiratory Protection Program.

B. Records include the following:

1. Written Respiratory Protection Program
2. Workplace Exposure Assessments
3. Medical Evaluation
4. Fit Testing and Training
5. Program Assessment

Respirator/Cartridge Selection and Change Out Schedule

Respirator Models:
Full Face = 3M 7800  
N95 = 3M 9211+/37193  
N95 = 3M 9210+/37192  
Alternate respirator models may be assigned to individuals on a case-by-case basis, such as the Honeywell N95 #14110451 (Grainger # 2EMT9).  
Note: Use of Leuco Crystal Violet indoors without a ventilation hood will require an air-supplied respirator.

END OF DOCUMENT
I. All laboratory employees will use the appropriate noise protection equipment when exposed to harmful noise levels and minimize noise levels which are irritating and distracting to others.

A. The extent to which hearing is impaired by sound is related to the volume and duration of the exposure. OSHA prohibits exposures of 90 decibels for more than 8 hours per day. Noise at 120 decibels is usually painful and can cause immediate damage. OSHA prohibits any exposure to noises at or above 120 decibels without hearing protection. As a reference, normal conversation is about 60 decibels, loud music is about 80 decibels, a rock concert is about 100 decibels, and a jackhammer 3 feet away is about 120 decibels.

B. Even at safe noise levels (below 90 decibels), noise can be irritating and distracting to individuals. Excessive noise can contribute to stress levels and can cause aggressive or abnormal behavior. It is to everyone's advantage to reduce unnecessary noise levels in the Division in order to create a more productive and peaceful work place.

C. Fortunately, very few activities in the Forensic Services Division produce hazardous noise levels. The exceptions are:

1. **Test firing of firearms** which can produce levels which cause immediate damage, depending on the weapon involved and the distance of the shooter.
2. The use of **power tools** may also produce hearing damage after prolonged exposure.
3. Employees must wear noise protection anytime there is reason to believe that harmful noise levels will occur.

D. In most cases, common sense and a consideration for others should guide employees in helping to reduce noise levels. Employees are expected to adhere to the following guidelines:

1. Conversations should be kept at a low volume.
2. Idle conversations should be kept to a minimum.
3. Personal radios, tape players, etc. may be used only if the volume and music does not bother others. The person playing the music or other program must take the initiative to ask others if the volume and content is acceptable and not wait for a complaint.
4. Loud music or other programs are not permitted.
5. Noisy equipment should be isolated to the extent possible.
6. Doors should be closed to confine noise when possible.
7. Limit the number of noise producing sources at any given time to avoid noise escalation as people try to talk over the equipment.

END OF DOCUMENT
I. Division staff members will adhere to reasonable precautions in the handling of physiological specimens or items contaminated with physiological fluids, even when dried, to avoid contaminating themselves or others with infectious agents.

A. Employees may be exposed to infectious agents through one or more of the following routes:

1. **Inhalation** - Droplets of liquid may be dispersed into the air, especially when opening vacuum tubes or dried physiological samples may become airborne in the manipulation of evidence such as bedding or clothing. The inhalation of infectious physiological samples can cause an infection to those exposed.

2. **Direct contact** - Infection through direct contact occurs most frequently when an employee handles a contaminated item, and then touches his or her face area thus transferring the infectious agent to the most susceptible areas of the body.

3. **Indirect contact** - Infection may occur in a person who does not handle the evidence or specimen but contracts the infectious agent through contact with other surfaces. This may occur in instances such as when a telephone has been handled by a person analyzing evidence who does not first wash his or her hands or when evidence is placed on office counters. As with direct contact, the infectious agent is usually contracted by the employee touching his or her facial area with contaminated hands.

4. **Inoculation** - An infectious agent may enter the body by piercing the skin, the body’s primary barrier against infection, with contaminated needles or broken glassware.

B. The likelihood of an illness developing from an exposure to an infectious agent will depend on a number of circumstances:

1. The most important being the virulence of the infectious agent.

2. The susceptibility of the individual.

3. The concentration of the infectious agent.

C. The higher the concentration of the microorganism, the more likely it will be able to overcome the barriers of the body and cause infection. Thus it is less likely, but still possible, that an infection will result from secondary contact with such things as evidence counters or telephones where the concentration of the microorganism has been significantly reduced.
D. Drying a physiological sample will destroy most microorganisms, reducing the likelihood of infection.

1. However, viruses have capsules which may protect them from adverse conditions (hepatitis is one of the most resistant) and some bacteria can produce spores capable of withstanding even the worst conditions for long periods of time. Thus even dried samples must be treated as potentially infectious.

E. By adhering to the following safety guidelines, employees can significantly reduce the likelihood that they or another staff member will contract an infectious disease from the handling of physiological specimens:

1. When working with any physiological sample, liquid or dried, always wear disposable gloves and a laboratory coat.

2. Always remove gloves or laboratory coat before contacting laboratory surfaces not normally used in the examination of evidence (e.g., telephones, front office copy machines and front counter).

3. When working outside of a fume hood with any liquid physiological samples or dried samples which may become airborne, the examiner must wear approved particle filtering masks and safety glasses or face shield.

4. Examine physiological samples in a fume hood when practical.

5. Wash hands often, especially after handling physiological samples and before eating or answering the telephone, using the disinfectant solution provided.

6. Disinfect laboratory tools frequently with at least a 1:10 dilution of bleach. If a centrifuge is contaminated by a broken tube containing a physiological sample, it must be cleaned immediately with the bleach solution.

7. Cover work surfaces with paper or plastic before placing evidence with physiological debris on the surface. Place the paper or plastic in a plastic bag, seal, and discard after the examination in the trash receptacle. (The use of paper does not apply to biological evidence contained in vials in the Alcohol and Toxicology Units).

8. Clean work surfaces after each case, or batch of cases, with a 1:10 solution of bleach.

9. Dry liquid or wet samples in a fume hood or in the ventilated closet designated for that purpose.

10. Dispose of liquid samples by a biohazard waste hauler, never by pouring down the sink or throwing in the garbage.

11. Whenever a physiological sample or evidence is known to be contaminated with an infectious agent, make sure that packaging and work areas are clearly labeled to alert others to the hazard.

12. Immediately repackage physiological specimens that are in broken or leaking containers or place in plastic bags to confine any infectious agent.

13. Evidence, which is stained, should be placed into a transparent container when needed as a court exhibit to eliminate the need to remove the item from its packaging in the court room. Evidence, which has dried physiological stains, may
otherwise be placed in paper packaging for storage. (Scotch Tape over small stains is appropriate.)

14. Always use extreme care with sharp objects and glassware to avoid accidental inoculation with contaminated objects. Remember that staples can puncture the skin, too.

15. Dispose of contaminated sharps in a sharps container box to avoid accidental punctures. Any accidental inoculation involving a physiological specimen must be reported on the County Accident Report form (AK30), Sharps Injury Log and the Bloodborne Pathogen Exposure Packet will be completed.

16. Report to your Supervisor for any injury involving a contaminated sharp and complete a Sharps Injury Log form within 14 days of the date of injury.

17. To reduce susceptibility to hepatitis, employees should give consideration to obtaining the vaccination available to them. (Policy reference SAF.24 Employee Vaccinations, for more information.)

18. Leave writing implements used during the handling of physiological specimens in that work area. They should not be taken to the office area.

END OF DOCUMENT
I. To ensure employee health and safety and to comply with state and federal regulations, a hazard communication program has been developed. This program includes information regarding workplace hazards, labeling of hazardous material containers, employee's rights under the hazard communication legislation and employee training requirements.

A. Both state and federal regulations have been enacted to protect employees against hazardous materials on the job. The regulations in California incorporate all of the federal requirements and have been followed in the development of this policy. The state regulations have been called Hazard Communication Regulations and consist of the following elements:

1. An inventory of the hazardous chemicals used at the various worksites
2. A collection of Safety Data Sheets for each of the hazardous chemicals
3. Proper labeling of all hazardous material containers
4. A written hazardous communication program (this policy) and a Chemical Hygiene Plan.
5. An employee training program covering the hazardous substances with which they work and the Hazard Communication Regulations.

II. The supervisors and managers at each work location bear the primary responsibility for ensuring compliance with the Hazard Communication Regulations. However, all employees will share responsibility by complying with this policy and by pointing out any deficiencies to his/her supervisor.

A. A hazardous material is anything listed in:

1. The Director's List of Hazardous Substances (Section 339 of Title 8, Calif. Code of Regulations)
2. 20 CFR Part 1910, Subpart Z, Toxic and Hazardous Substances, Occupational Safety and Health Administration
3. Threshold Limit Values for Chemical Substances in the Work Environment, American Conference of Governmental Industrial Hygienists, 1984
5. International Agency for Research on Cancer, Monographs, Vols 1-34

B. A hazardous substance may also be any other substance, which presents a physical or health hazard as determined by scientific evidence.
C. An inventory of the Forensic Services Division has been prepared listing, by worksite, any hazardous substances which fall into any of the above categories.

1. Any employee who is aware of a substance not on the inventory, which he/she believes is hazardous, must bring it to the attention of his/her supervisor.

D. Whenever an employee wishes to use a hazardous substance at a new worksite, he/she must inform his/her supervisor, who will ensure that the inventory is updated.

E. When new hazardous substances are ordered for use by the laboratory, the supervisor responsible will ensure that they are added to the inventory.

F. Certain types of materials are exempt from the regulations and will not be included in the inventory. Exempt materials are:

1. Hazardous wastes (regulated by EPA)
2. Tobacco products
3. Wood and wood products
4. Manufactured items
5. Food, drugs and cosmetics used by employees
6. Retail consumer products, unless the employee's exposure is greater than the exposure of an ordinary consumer

III. All employees should review the Safety Data Sheets for the chemicals that they are using.

A. A Safety Data Sheet (SDS) is prepared by the manufacturer of a product containing 1% or more of a hazardous substance (or 0.1% if it is a carcinogen). The SDS is a document containing, in layman's terms, the hazards and precautions associated with a product. A product may contain more than one hazardous substance, but will require only one SDS. Each SDS must contain the following information:

1. Trade name (product name).
2. Chemical and common name and Chemical Abstract Service numbers of each hazardous ingredient.
3. The physical and chemical properties such as vapor pressure, flashpoint and solubility of the chemicals.
4. The physical hazards such as fire, explosion and dangerous chemical reactions.
5. The specific acute (short term) and chronic (long term) health hazards, including the signs and symptoms of illness and medical conditions which may be aggravated by exposure.
6. The potential routes of entry of the hazardous substance(s) into the body.
7. The permissible exposure limits published and/or recommended limits for the hazardous substance(s) (OSHA Permissible Exposure Limit) and the American Conference of Governmental Industrial Hygienists Threshold Limit Value and any other limit recommended by the manufacturer.
8. If the hazardous substance(s) is listed as a carcinogen by the National Toxicology Program, the International Agency for Research on Cancer, or the Occupational Safety and Health Administration.
9. The precautions necessary for the safe handling, use, and storage, including protective measures for repair and maintenance of equipment.

10. The known control measures, including engineering, work practices and personal protective equipment necessary to protect against the hazards.

11. Emergency and spill clean-up procedures.

12. First aid procedures.

13. The date of preparation of the SDS or the date of the last change in contents.

14. The name, address, and phone number of the party responsible for preparing the SDS.

B. Manufacturers, distributors and importers are required to provide an SDS to any purchaser of a hazardous product. If an SDS is not received with a hazardous material, the purchaser is required to ask the vendor for one and notify Cal/OSHA of any difficulty in obtaining an SDS from a vendor.

C. Binders are located in the various work sites of the laboratory areas of each Division facility, which contain the SDS for hazardous materials used at that location. There are separate binders for Biology, Firearms, Fingerprints, Crime Scenes, Drug, Alcohol, Toxicology, and Miscellaneous. The Supervisor or Manager at each location will ensure that the binders are kept current. In addition, a total list of SDS is in the facility is located in red binders in the reception area of the Summit and Muir facilities for the emergency personnel.

D. Any laboratory employee receiving an order will check to see that the appropriate SDS is included with any hazardous material and contains the necessary information described above. If not, the appropriate supervisor must be informed. It will be the responsibility of that supervisor to ensure that a request, in writing, is made to the vendor for the SDS and/or Cal/OSHA is notified, in writing, of the inability to obtain the SDS or that the SDS is incomplete within 25 working days of the request for the SDS. Complete SDS will be added to the binder in the laboratory areas as well as the red binders at the front of the lab.

E. Chemicals and drugs should have the following labeling requirements:

1. All manufacturers, importers, and distributors are required to label products containing hazardous substances with the following information:
   a. identity of the hazardous substance(s)
   b. hazard warning statements
   c. name and address of the manufacturer or importer

2. The following types of materials, which are labeled in accordance with various federal agencies, do not need additional labeling:
   a. pesticides
   b. food, drug, and additive products
   c. alcoholic beverages
   d. consumer products

IV. Any laboratory employee checking on an order containing a hazardous substance will verify that the container has the information required as listed below.
A. A number of different systems exist for labeling hazard warnings.
   1. The NFPA 704 or Haz Com 2012 label format shall be used.
         • A color code will be utilized to indicate the category of the hazard (i.e. red for flammable).
           • Red for Flammability
           • Blue for Health Hazard
           • Yellow for Instability
           • White for Special Hazards (letters may be used)
         • A number will be used to indicate the severity of the hazard (0 means no significant hazard and 4 means extremely hazardous).
         • Product Identifier
         • Signal Word
         • Hazard Statements
         • Pictograms
         • Precautionary Statements
         • Name, address and phone number of responsible party
         • A number may be used to indicate the severity of the hazard (4 means least severe hazard and 1 means most severe hazard)
           • PLEASE NOTE: This number indicator is not the same as for NPFA labeling.
   
   2. More information regarding hazard labels is provided in the hazard communication training through Target Solutions.

B. Employee may date and initial the container or electronically record the information in a database.

C. No employee is to remove or alter the required labeling on hazardous materials. Any label, which is damaged, must have the appropriate information replaced.

D. Each employee is charged with the responsibility of transferring hazardous substance and hazard warning information to secondary containers which he/she prepares.

E. Reagents which are prepared from several hazardous chemicals must be labeled with all of the relevant hazard warnings.
   1. In some situations the preparation of a reagent will neutralize the hazard, thereby reducing the hazard warning.

F. Supervisors will monitor work areas to ensure compliance.
V. The initial training and an overview of the Hazard Communication Regulations (including employee rights under the regulations) will be provided to currently employed and new employees by a laboratory supervisor(s) in person or through online training on Target Solutions.

A. A Hazard Communication Program Training Protocol has been developed to cover the nine topics listed below and used as a reference for laboratory staff.

1. An overview of the requirements in the Hazard Communication Regulations.
2. Designation of which hazardous chemicals are in which work areas.
3. A review of the safety policies in PowerDMS associated with hazard communication.
4. Physical and health effects of the hazardous substances used in this laboratory.
   a. flammables
   b. poisons
   c. corrosives
   d. toxics
   e. explosives
   f. teratogens
   g. mutagens
   h. oxidizers
   i. pressure hazards
   j. biohazards
5. Methods and observation techniques used to determine the presence or release of hazardous substances in the work area.
6. How to lessen or prevent exposure to these hazardous substances through usage of control, work practices and personal protective equipment.
7. Emergency and first aid procedures to follow if employees are exposed to hazardous substances.
8. Distribution of a sample SDS and an explanation of the information it contains.
9. How to read labels and review SDS to obtain appropriate hazard information.

B. A refresher training will be offered on an annual basis.

C. Each employee must review the SDS for the chemicals in his/her work area.

1. Each time an employee transfers to a new work site or unit, he/she must review the SDS for the hazardous chemicals in the new work area.
2. Employees will be required to sign a form (See SAFF.11) indicating that they have read the relevant SDS each time they transfer to a different (new) work assignment or Unit if they have not already reviewed the SDS's for that section. Alternately,
documentation of SDS acknowledgement may be recorded in the employee's training program.

3. Whenever a new hazardous material is used in a work area or updated SDS is obtained, the appropriate supervisor will ensure that the affected employees are made aware of the addition and the relevant information described above.

D. Anytime a temporary employee or a worker or contractor, from outside the laboratory division, must work in an area in which hazardous materials are in use or where the possibility exists that the person may be exposed to a hazardous material, that person is entitled to know the identity of the hazardous substance to which he/she may be exposed as well as precautions which would lessen any exposure or possibility of exposure.

1. When any appropriate protective equipment is available (e.g., gloves, ear plugs, safety goggles, etc.), it will be provided to the worker.

2. The supervisor of the appropriate laboratory location will ensure that the relevant information is provided.

END OF DOCUMENT
I. Chemicals must be segregated by hazard for safe storage. Separate storage areas have been designated for flammables, acids, bases and or other chemicals. In addition, great care must be taken to ensure that incompatible chemicals do not come into contact with one another.

A. Those chemicals, which do not have labeling indicating the proper hazard category for storage, must have the appropriate NFPA 704 label or HazComm 2012 attached.

B. Chemicals must not be stored on open shelves.

C. Storage shelves must have restraint barriers or doors.

D. Separate storage areas should be provided for "incompatible chemicals": chemicals, which may react together and create a hazardous condition because of this reaction. Some examples of these incompatible chemicals are listed in the following table:

<table>
<thead>
<tr>
<th>Chemical</th>
<th>Keep Out of Contact With:</th>
</tr>

</tbody>
</table>

The NIOSH Pocket Guide to Chemical Hazards, U.S. Department of Health and Human Services, 2005, may be used as a source of a more comprehensive list of incompatible substances.

END OF DOCUMENT
Highly explosive and reactive substances, whether evidence or reagents, will be limited in amount to quantities essential for examination. Under no circumstances will "live" explosive devices be allowed in the laboratory. Explosive and reactive substances will be handled in a way to ensure the safety of all personnel.

A. Explosive and reactive substances may be safely handled as long as the conditions, which cause the reaction, are avoided.

B. It is imperative that laboratory staff knows which chemicals are reactive and avoid initiating an undesired reaction by consulting the Safety Data Sheets, the CHRIS Manuals or the NIOSH Pocket Guide to Chemical hazards. A list of common incompatible chemicals is located in FSD Safety Manual Policy SAF.12 Storage of Chemicals.

C. The laboratory will limit the use of air and water reactive chemicals to those, which are essential.
   1. Sodium hydroxide is a commonly used chemical, which is water reactive, but can be used safely by controlling the mixing of small quantities of the chemical with water.

D. There are a far greater number of chemicals in use in the laboratory which are not reactive alone, but which can initiate a violent reaction when mixed with another chemical.
   1. Such undesirable reactions can be avoided by knowing which chemicals are incompatible and by segregating storage and disposal of such chemicals.
   2. As a general guideline, flammables, organics, reducing agents and oxidizing agents should be separated.

END OF DOCUMENT
I. Flammable chemicals will be stored and used in a way to ensure the safety of laboratory staff and facilities.

A. Many flammable chemicals are used in the Forensic Services Division. Nearly all are liquids. The primary hazard of flammable chemicals is fire. With the use of proper safety measures, the hazard of fire can be greatly reduced or eliminated and the chemicals can be used safely in the laboratory.

B. Following are several guidelines, which must be observed to ensure employee safety when handling flammable chemicals:

1. Eliminate all sources of ignition around flammable chemicals. This includes the use of matches, Bunsen burners, or alcohol lamps.

2. Flammable chemicals should not be heated in the oven.

3. When flammable vapors are present, any equipment in use must be explosion-proof (non-arcing.) This includes stirrers, hotplates, fume hoods and refrigerators.

4. Only small quantities of solvent evaporation may be performed in a fume hood. Containers must always be labeled with the contents.

5. Flammable liquids, up to 1 liter per chemical, that are used regularly may be stored in fume hoods.

6. Quantities of flammables, up to 5 gallons, may be stored in the flammable storage cabinets at the Summit and Muir laboratories.

7. If the total amount of flammable liquid(s) stored exceeds 5 gallons, it must be stored in an approved flammable storage cabinet or storage room. The exception is small quantities stored for immediate use in fume hoods.

8. Flammable chemicals must always be stored away from fuel sources, strong acids, and oxidizing agents such as sulfuric acid or permanganates.

9. Preparation of reagents using flammable chemicals should always be performed in a fume hood.

END OF DOCUMENT
I. All laboratory staff members will exercise reasonable caution in the use of toxic materials to minimize or eliminate exposure and harm to themselves and others. Whenever possible, the use of highly toxic substances will be eliminated or less toxic agents will be substituted for them. Chemicals designated as known carcinogens in the California Code of Regulations will not be used in the laboratory.

A. Toxic chemicals are those which pose a health hazard by damaging the body or interfering with normal biological function at relatively low doses. The severity of the effect can vary from quite mild to lethal and is dependent upon the particular chemical, the sensitivity of the individual, and the size and length of the exposure. The type of toxic effect the substance has on the body may include one or more of the following categories:

1. **Poison** - an agent which hinders or destroys the ability of cells to carry out their function.
2. **Mutagen** - an agent which causes changes in the genetic composition of cells.
3. **Teratogen** - an agent which causes abnormalities in a developing fetus (birth defects).
4. **Carcinogen** - an agent which causes cancer.

B. The effects from a toxic substance may occur immediately or may be delayed for years. Repeated exposure to some toxic materials may also cause cumulative damage. In addition, many toxic chemicals may exhibit other types of hazards, such as flammability or reactivity.

II. Laboratory staff must be alert to the potential for chemical exposure from one or more of the following routes, depending on the chemical (refer to Safety Data Sheets for routes for specific chemicals):

A. **Absorption** - Many chemicals may be absorbed directly through skin or cuts in the skin or mucous membranes. Absorptivity may also be enhanced when a chemical is in a particular solvent. Use appropriate gloves to prevent absorption through the hands.

B. **Ingestion** - Most ingestion is the result of poor hygiene, carelessness or habit. Staff members must be conscientious to avoid inadvertent ingestion.

C. **Inhalation** - Most solids are not volatile enough to pose a hazard through inhalation. Units should identify the volatile solids used in their CHP. The most likely routes of exposure to toxic materials is through inhalation of toxic, volatile liquids.

D. **Inoculation** - Toxic materials may be introduced into the body through accidental puncture from contaminated sharps or broken glassware.
E. **Indirect contact** - This is merely a variation of exposure through absorption or ingestion, but results from contact with a surface or item previously in contact with a toxic material.

### III. Additional guidelines for Toxic Chemical Safety:

A. All volatile toxic chemicals must be used in a fume hood.

B. Small quantities of these chemicals, in sealed vials, may be used as injection standards for the gas chromatographs.

C. Spraying of toxic chemicals in the laboratory must be done in a properly ventilated hood.

D. Contaminated materials must not be taken into non-laboratory areas. This includes the wearing of gloves or lab coats in office areas.

E. Evidence which is toxic or which has been treated with toxic chemicals must be sealed to avoid the release or transfer of toxic residue or fumes. Those items, which present a hazard through contact only, may be packaged in plastic. Volatile hazardous materials must be packaged in glass, metal, or other impermeable containers.

F. Equipment and tools used with toxic materials should be cleaned frequently to minimize transfer of toxic residues.

G. Chemicals listed as known carcinogens in the California Code of Regulations will not be used by laboratory staff.

H. Whenever possible, less toxic materials should be substituted for those, which are particularly hazardous.

I. The effluent from gas chromatographs used to analyze toxic materials must be directed into charcoal traps.

J. Any evidence contaminated with a radioactive chemical will not be examined by the laboratory.

<tbody>
<tr>
<td>Benzene</td>
<td>71432</td>
</tr>
<tr>
<td>Carbon Tetrachloride**</td>
<td>56235</td>
</tr>
<tr>
<td>Dioxane**</td>
<td>123911</td>
</tr>
</tbody>
</table>

**NOTE** - ** - EPA has classified Dioxane and Carbon Tetrachloride as Group B2, a probable human carcinogen.
I. Corrosive chemicals are acids and bases which, through their caustic properties, cause direct physical destruction of tissue. Clearly, direct physical contact with strong acids or bases can cause burns which are even more severe than thermal burns. Damage can occur from corrosive fumes when present in sufficient concentrations in the air.

A. Corrosive chemicals can be used safely in the laboratory by adhering to the safety recommendations in the Safety Data Sheets for the chemicals in question and by following the safety rules here:

1. Wear safety glasses or a face shield when pouring corrosive chemicals or mixing reagents which contain corrosive chemicals.
2. Wear a laboratory coat and a rubber apron when there is the potential for splashing a corrosive chemical.
3. Wear the proper gloves when working with any corrosive chemicals.
4. When diluting acids or bases, always add the corrosive material to water, and not vice versa.
5. Liquid acids and bases are always stored separately from one another. They are never stored with the organic solvents or the solid chemicals.
6. Normally, like chemicals can be stored together. However, acetic acid must be kept separate from perchloric acid and nitric acid
7. Preparation of reagents must be done in a fume hood.

END OF DOCUMENT
Compressed gases are hazardous primarily because they are under such great pressure. If a gas cylinder is damaged by careless handling, it could turn into a lethal projectile. In the event of a fire, overheating of a cylinder can create the same problem. Most of the compressed gases which are used in the laboratory are not themselves hazardous (for example, air, nitrogen, and helium). However, hydrogen, which is flammable, presents hazards in addition to the high pressures. Safety Data Sheets should be consulted for information on these additional hazards.

A. Compressed gases can be used safely in the laboratory if these guidelines are followed:

1. Cylinders must always be moved by laboratory staff in the hand cart and **NOT** by the valve portion of the cylinder. The valve cap must always be on when the cylinder is moved.

2. Cylinders in the laboratory must be chained or otherwise restrained at all times (except small dry gas cylinders used for breath instruments).

3. Lines carrying compressed gases must be labeled with the name of the gas:
   a. Air
   b. Helium
   c. Hydrogen
   d. Nitrogen

4. Valves and regulators should be visually inspected for damage each time a cylinder is changed.

5. Cylinders must be handled with extreme caution at all times to avoid dropping them and/or damaging the valves.

6. Cylinders, which are not in use, must have safety caps over the valves.

7. Never attempt to use a cylinder without the correct regulator. The threads and fittings on regulators are designed to fit only compatible tanks. Never connect a line directly to the tank valve.

8. Cylinders are to be stored upright at all times.

9. Cylinders must always be closed at the cylinder valve, never at the regulator. Always check to see that the cylinder valve is closed before disconnecting the regulator.
10. To avoid damaging delicate instruments, regulators should be closed or set at the proper pressure before opening the cylinder valve. If there is any doubt about the proper procedure, consult the directions for the instrument or a staff member familiar with the instrument.

11. Whenever fittings, regulators, or lines are changed, test them for leaks with a liquid soap solution (Snoop).

END OF DOCUMENT
I. Reagents are prepared in normal laboratory functions. Staff should adhere to the following guidelines when making reagents of mixed chemicals:

A. **Always** read the label on a container before using the contents.

B. **Never** return excess chemicals to the original container. The excess should be discarded in the appropriate waste container to avoid contamination of the contents of the original container.

C. Use caution to avoid drawing liquids up into pipette bulbs. Do not lay used pipettes directly on work surfaces.

D. Chemical containers should be opened with the opening away from the employee's face.

E. The preparation of reagents or the transfer of chemicals from one container to another should be done in a fume hood.

F. All reagent or secondary containers (except those for immediate use) are to be labeled at the time of preparation or transfer with the name of the reagent or chemical, hazard warning label, the date of preparation, and the initials of the person preparing or transferring the substance.

G. Chemicals **must not** be pipetted by mouth.

H. Replace caps on chemical containers immediately after use. Follow Safety Data Sheet requirements on special handling or storing requirements.

I. Return chemicals immediately to their proper storage area after each use.

END OF DOCUMENT
I. Each staff member is responsible for the clean-up of their work area. These are guidelines for clean-up after chemical and/or physiological casework:

A. Any chemicals, which are spilled, must be cleaned up immediately.

B. Place all broken glassware, pipettes, test tubes, tissues, microscope slides, empty reagent bottles, etc. which are contaminated with chemicals in the "sharps" disposal location. These must not be thrown in the regular trash which is emptied by custodial staff.

C. Employees must clean non-disposable glassware and utensils as soon as practical after use with chemicals.

D. A general laboratory clean up should be performed periodically. Employees are responsible for cleaning up their work area to prevent any possible contamination or cross-contamination.

E. All evidence intake and release counters will be cleaned periodically by the custodial staff at the Muir and Summit locations.

II. Disposal of all chemical waste materials in the laboratory must be in compliance with local, state, and federal regulations.

A. The disposal of hazardous material falls under a number of state and federal statutes. Whenever questions arise regarding the proper procedures for waste disposal, they should be directed to one of the Hazardous Materials Specialists.

B. The Forensic Services Division is the waste generator for all of the hazardous chemicals disposed of by the laboratory which are produced from in-laboratory analyses. The laws make the generator of waste responsible for the waste from "cradle to grave". This means that the generator is responsible for the waste, even after it is turned over to an approved disposal company or site. Consequently, it is critical that all chemical wastes be properly disposed of.

C. Waste that is generated in the Laboratory should follow these guidelines:

1. Small residual amounts of chemicals may enter the sewer system when glassware is washed. However, this should be minimized to the extent possible. The water should be left on for several minutes to further dilute the substance.

2. Large volumes of volatile chemicals will not be evaporated in a fume hood for purposes of waste disposal.

3. All other liquid chemicals will be discarded by pouring into the proper waste containers at each facility.
a. Separate waste containers are available for flammables, acids, bases, and other toxic chemicals.

b. Care must be taken to ensure that a chemical is not added to a container with contents which will cause a reaction.

c. The chemical contents in a waste container need to be documented. These can be maintained on a waste log for each container or identified on a label attached to the waste container.

d. These waste containers can be stored in the fume hood until full or 90 days after the initial chemical was added to the container, whichever is sooner.

e. The container must be kept capped until it is filled. Once filled, containers are sealed, the waste log (when maintained) attached, and placed in the proper storage cabinet, drums or location until disposal is arranged.

f. Prior to the waste disposal, the waste containers/drums that get hauled will be labelled as "Hazardous Waste". The labeling on waste containers/drums shall include: name of the waste, address of the generation site, the accumulation date/initials, the composition, physical state, hazardous properties and NFPA rating.

III. The following is the Division Waste Disposal Procedures:

A. The Forensic Services Division facilities each have their own EPA ID number:
   1. CAL 000384029 - 2530 Arnold Drive, Second Floor
   2. CAL 923245042 - 1960 Muir Road, Second Floor
   3. CAR 000114223 - 2099 Arnold Industrial Way, Concord

B. Hazardous waste is disposed of by contracting with a hazardous waste disposal company. A waste pick-up is coordinated for all facilities every 90 days.

END OF DOCUMENT
I. Employees will exercise caution in the handling of all chemicals to avoid accidental spills. Employees will familiarize themselves with emergency procedures in the event that an accidental spill of a hazardous chemical occurs.

   A. Information regarding the proper clean up procedures, including needed protective clothing, for hazardous chemicals can be found in the appropriate Safety Data Sheets.

      1. The approach to clean up e.g., dilution, neutralization, ventilation, absorption, etc. applies regardless of the size of the spill.

II. When an emergency spill occurs, employee will usually not have time to begin researching the proper emergency procedures before taking action. Therefore, it is critical that employees be familiar with the correct emergency action in the event of an accidental spill before using a chemical.

   A. Although each chemical may require a different response in the event of a spill, certain general guidelines can be applied:

      1. If an employee knows a chemical is not hazardous, he/she should clean up a spill in the appropriate manner as soon as possible.

      2. If the employee knows that the chemical is hazardous, but is able to safely clean up the spill using available protective equipment as necessary, he/she must do so immediately.

         a. If the chemical poses a contact hazard, the employee must ensure that other employees do not come into contact with the chemical.

         b. If the chemical poses an inhalation hazard, the employee will ensure that employees without the proper protective equipment vacate the area.

      3. If the employee does not know the identity of the chemical, does not know the correct clean up procedures, or it is beyond the capability of the laboratory to safely clean up the chemical, he/she will immediately vacate the area and advise other employees to leave also.

      4. Anytime an immediate clean up is not possible, the employee will notify his/her supervisor. If that supervisor is not available, then at least one of the following individuals must be notified in the order listed:

         a. Immediate Supervisor or Designee

         b. Another Division Manager

         c. Chief of Forensic Services
5. After evaluating the situation, the supervisor may determine that it is safe to proceed with cleaning up or may ask Hazard Materials personnel for advice or help with the clean up.

B. Containment and Clean-up Procedures:

1. **Small spill** (1 gallon or less) that **does not** require respiratory protection (such as corrosive chemical spills):
   a. Immediately alert personnel in the area and your supervisor.
   b. Check the Safety Data Sheet concerning relevant health hazards.
   c. If flammable, extinguish ignition sources.
   d. Use the personal protective equipment described in the Safety Data Sheet, confine the spill with spill socks, granular absorbent or absorbent pads.
   e. Absorb the material, and dispose of in an appropriate container (usually a wide-mouth high density polyethylene (HDPE) container). Label as hazardous waste (include the type of chemical), date and store appropriately until the next available disposal.

2. **Small spill** (1 gallon or less) that **requires** respiratory protection (such as organic solvents):
   a. Immediately evacuate the area; turn on ventilation hood and close doors to the room and place a warning sign on the door.
   b. Alert personnel in the area and your supervisor.
   c. If the spill is small and the type of spill is known then HAZWOPER trained laboratory staff may don appropriate personal protective equipment and proceed with the spill containment and cleanup.
   d. If the spill appears unsafe for laboratory staff to clean, then contact the County Hazardous Materials Specialist at 335-3200 or the 24 hour hotline 335-3232.

3. **Large spills** or severe toxic substance release:
   a. Possible situations:
      i. In the event that a pressurized cylinder inside the building begins to release and cannot be shut off by normal means
      ii. Stored waste chemicals overturns and spills
      iii. Extremely toxic substances are being used and are spilled outside of a hood
      iv. Chemical quantities exceeding 1 gallon
   b. Actions to be taken:
      i. Immediately evacuate the room and close all doors to the area.
      ii. Notify your supervisor who will notify the chain of command and the Officer of the Day
iii. The laboratory will be evacuated until it can be determined that re-entry is safe.

iv. Contact the County Hazardous Materials Specialist at 335-3200 or the 24 hour hotline 335-3232.

END OF DOCUMENT
I. Medical and environmental screening is available, upon request, in order to provide early detection of harmful effects of certain chemicals and biological agents used or encountered in the laboratory and to ensure a safe working environment.

A. Biological Agent Screening

1. Engineering controls are used to prevent exposure of employees to infectious biological agents, which may be carried in physiological specimens. However, accidents, such as needle sticks, cuts by bloody glass, can occur which would expose the employee to possible infection. Diseases like Hepatitis, AIDS and many potential infectious agents may be encountered.

2. Any employee who experiences a body fluid to body fluid exposure by sharps injury or spilling blood on an open wound must report this immediately to their supervisor. The supervisor will obtain a Contra Costa County Office of the Sheriff "On The Job Injury" Packet and the supplemental Bloodborne Pathogen/Communicable Disease Exposure Packet. The following forms in these packet should be completed:
   a. A County Accident Report Form (AK-30)
   b. Employees Claim for Workers Compensation Benefits (DWC-1)
   c. Physician's Statement of Ability to Work (AK142 - completed by employee's physician)
   d. Notification for Possible Communicable Disease Exposure
   e. Consent for the HIV Antibody Blood Test (If appropriate)
   f. Petition for Order to Test Accused' Blood (If appropriate)
   g. Consent to Release the Results of Tests to Detect the Presence of HIV (If appropriate)
   h. Sharps Injury Log (this form remains in the Section)
      i. All completed forms except the Sharps Injury Log shall be forwarded to the Sheriff's Administration, Inspection and Control, and Risk Management via the chain of command within 24 hours of exposure.
      ii. Follow-up testing is highly recommended to establish a baseline test. Employees are encouraged to contact the County Public Health Department, Contra Costa Regional Medical Center, or their personal physician to be serially tested and receive counseling.
3. Division employees who handle biological samples may also wish to obtain a routine screening test for Hepatitis or AIDS.
   a. AIDS screening is available every Tuesday morning from the County Public Health facility. Testing is free and confidential.
   b. Hepatitis vaccination can be obtained through the employee's physician or, by prior arrangement, from the County Health Services Department at time of hire. Testing may be done on County time and, if the cost is not covered by the employee's health insurance, at County expense.
      i. Employees should notify their supervisor in advance if time off or payment for the testing is necessary.
      ii. Testing by County Health Services must also be arranged by the employee's supervisor.

4. Screening of other biological agents is not routinely available through the County. However, if an employee feels that such testing is needed, he/she should consult with his/her supervisor who will consult with Health Services to see if testing is necessary and if it is available.

B. Chemical Agent Screening

1. It is the Division's policy to employ engineering controls to minimize the exposure of employees so that they will not experience harmful effects from the chemicals used in the Division.
   a. Engineering controls include the use of fume hoods, the use of personal protective equipment, substituting less hazardous chemicals for harmful ones, minimizing the amount of chemical used, etc.

2. Firearms examiners may be tested yearly for lead levels in blood.
   a. Screening of employees for excessive exposure to other hazardous chemical agents is not routinely done.

3. For chronic exposures, environmental screening is usually available.

4. In acute exposures, tests may not be available or the level or form of the chemical may not be amenable to testing.

5. In the event of a significant chemical spill where protective measures were not in place or the measures may have failed, then the following should be completed:
   a. A County Accident Report Form (AK-30)
   b. Employees Claim for Workers Compensation Benefits (DWC-1)
   c. Toxic Substance Exposure form

C. If an employee feels that medical screening should be considered, he/she must submit a written request to his/her supervisor.

1. The request should include a justification for testing.
   a. A typical justification would include reasons why engineering controls do not effectively protect the employee from excessive exposures.
b. California Occupational Safety and Health Administration (Cal/OSHA) regulations do not require employee screening unless there is a reasonable belief that the employee's exposure exceeds allowable limits.

2. With the approval of the Chief of Forensic Services, the Supervisor will forward the request to the County Risk Management.

3. It will be the responsibility of the County Risk Management in conjunction with a Health Services consultant to determine what, if any, testing is practical and feasible or required under Cal/OSHA regulations.

D. Environmental Screening

1. If excessive chemical exposures are suspected, environmental monitoring is more likely to be used than employee testing. It is easier to perform and more likely to yield usable information. As indicated above, engineering controls are the preferred approach to avoid excessive exposure.
   
   a. However, if an employee feels engineering controls are inadequate to protect personnel from exposure above allowable limits, a written request should be submitted to the supervisor in writing.
   
   b. As with medical monitoring, the employee should state the reason for believing engineering controls are inadequate.

2. With the approval of the Manager, the supervisor will forward the employee's request to County Risk Management. Risk Management along with the County Health Services /Hazardous Materials/Occupation Health staff will determine what action is appropriate and practical.
   
   a. Action may range from a site inspection to full environmental monitoring.

   
END OF DOCUMENT
The Forensic Services Division will maintain records of employee exposures and medical records associated with employment, in compliance with state law. Employees will be permitted access to these records according to procedures specified by law.

A. **Employee Exposure Record** - A record containing any of the following kinds of information concerning employee exposure to toxic substances or harmful physical agents:
   1. Environmental monitoring or measuring
   2. Biological monitoring to directly assess the absorption of a substance by the body (e.g., the level of a chemical in the blood, urine, etc.) but not the biological effect of the substance
   3. Safety Data Sheets (SDS)
   4. In the absence of any of the above, any record which identifies a toxic substance or harmful physical agent.

B. **Employee Medical Record** - A record concerning the health status of an employee which is made by a physician, nurse, or other health care personnel or technician. This would include interpretation of the results of biological monitoring.

C. **Toxic Substance/Harmful Physical Agent** - Any chemical substance, biological agent, or physical stress which is:
   1. Regulated as a health hazard by California or Federal law or rule
   2. Listed in the latest edition of the NIOSH Registry of Toxic Effects of Chemical Substances
   3. Shown by testing to have an acute or chronic health hazard
   4. Described as a potential or known health hazard to humans in a Safety Data Sheet provided to the employer

II. Under California law, all employees are entitled to have access to records which are prepared by or for the employer and are related to exposure to toxic and harmful materials including infectious agents while on the job.

A. The law does not mandate employers to perform exposure monitoring or employee medical examinations in the absence of a reasonable belief that the employee is being exposed to greater than allowable limits of toxic or harmful materials. However, once records are prepared, even when an exposure is not believed to exceed allowable limits nor is the harmful material regulated, these records will be retained by the County in one or more locations for the period(s) specified by law.
B. Retention Requirements:
   1. All Employee Medical Records must be retained for the duration of employment plus thirty years.
   2. All Employee Exposure Records must be retained for at least thirty years.
   3. SDS will be retained in the Division for thirty years.

C. Access Requirements:
   1. The right of access to medical and exposure records is guaranteed to the employee, his/her designated representative, and any representative of the Division of Occupational Safety and Health.
   2. Requests for records must be provided to the employee's supervisor in writing. If the records reside within the Forensic Services Division, the supervisor will provide a copy of the requested records to the employee or designated representative as soon as possible, and in any case, not more than 15 days after receiving the written request.
   3. If the records reside in another location, the supervisor will forward the request to the appropriate location and will notify the employee in writing within 15 days that no records exist in the Division.
   4. The supervisor will follow through when possible to assist in providing the employee with timely copies of records or access to the requested information.
   5. Copies of records are provided to employees or designated representatives at no cost.

D. Authorization of an Employee Representative:
   1. An employee representative may not receive exposure or medical records without written authorization from the employee.
   2. The exception is that the employee's bargaining unit may receive exposure records (but not medical records) without written authorization.

E. Any written authorization must contain the following:
   1. The name and signature of the employee authorizing release of the information.
   2. The date of the written authorization.
   3. The name of the designated representative authorized to receive the information.

F. A written authorization for medical information must also contain:
   1. The name of the individual or organization authorized to release medical information.
   2. A general description of the medical information to be released.
   3. A general description of the purpose for release of the medical information.
   4. A date or condition upon which the authorization will expire if other than one year.

G. Release of Medical Information:
1. Whenever an employee requests medical records, it is likely that the County will either 1) require the employee or his/her representative to consult with a physician employed by the County who will explain the records, or 2) authorize release of medical records only to the employee's physician.

H. Release of Exposure Records: Exposure records which are to be provided to an employee or his/her representative include:

1. Records of the employee's past or present exposure to toxic substances or harmful physical agents.
2. Exposure records of other employees with past or present job duties or work conditions related to or similar to those of the employee.
3. Records containing exposure information about the employee's work place or working conditions.
4. Exposure records related to workplaces or working conditions to which the employee is being transferred or assigned (for example, records of environmental monitoring.)

I. Preparation and Storage of Records:

1. Records, which are subject to these laws, may be prepared or received from a number of different sources or for a number of different reasons. Following are those records which it is anticipated a Division employee would most likely want to access:

2. County accident reports (form AK-30) prepared as the result of an illness or injury from exposure to a toxic material or infectious agent. Copies of these are retained in the Division. However, the official record for purposes of the retention of these records resides in the County Risk Management.
3. Pre-employment examinations. Copies are retained by the physician performing the examination and in the employee's personnel file in the Administration Division.
4. Medical questionnaires or histories such as those given as part of the Respiratory Protection Program. The Division receives only a report of fitness for a task. The medical records are retained by the physician in charge, in the County Health Services Department.
5. Any medical reports, diagnoses, treatments, or recommendations given to the County as the result of a job related accident or injury. These recommendations are retained by the physician performing the examination. A report may reside with the County Personnel Department. If an employee goes to his/her own physician for a job-related injury, these records may not be provided to the County in which case they would not be subject to these regulations.
6. Any monitoring of the Division for exposure levels of hazardous chemicals or other materials, usually performed by Hazardous Materials personnel or coordinated by Risk Management. The Forensic Services Division usually receives and retains copies of these reports. A more complete record is retained by Hazardous Materials or Risk Management.
7. Any employee exposure testing such as tests for AIDS or Hepatitis antibodies or tests for blood lead levels. These records are not usually supplied to the Division and are retained by the physician overseeing the testing.
8. Current Safety Data Sheets are in the binders in the various work stations. Outdated MSDS/SDS are retained in the Division administrative files for thirty (30) years.

9. Chemical inventories are performed at each laboratory yearly. Records will be located at each laboratory location or electronically.

10. Employees may wish to self-initiate an exposure to a chemical hazard. Potential toxic exposure may be documented using the AK30 and are available to the employee who wishes to document the use of toxic materials even though no effects are noticed or there is no reason to believe exposure exceeds allowable limits. These forms will be retained for thirty years and are subject to access as described in this policy.

11. Any injury caused by contaminated sharps (needle stick, scalpel cut) or while working with a physiological fluid shall be reported on an AK-30 form and a Blood-borne Pathogen Exposure packet will be completed, if applicable. A Sharps Injury Log form (SAFF.02) will also be reported for injuries by contaminated sharps.

END OF DOCUMENT
I. All laboratory employees who handle physiological samples in the course of their duties are encouraged to take advantage of the immunizations available for Hepatitis B.

A. The infectious agent most likely to cause death or serious illness among laboratory employees who handle liquid blood samples is the Hepatitis B virus. Because of the volume of physiological samples received in the Laboratory and because many of the samples come from the high risk population (intravenous drug users), employees who handle these specimens are encouraged to obtain immunizations against the Hepatitis B virus.

1. The process may begin with a test for the Hepatitis antibodies. If the antibody test is negative, then the vaccination process will proceed. The vaccination consists of three shots received one to two months apart. A vaccine is available from a genetically engineered source, thus eliminating the negligible potential for exposure to a secondary disease, such as AIDS, from the vaccine.

2. The vaccination series must be followed by another antibody test several months later to ensure that the employee acquired immunity from the vaccinations. A small percentage of people do not form antibodies and cannot be protected with the vaccination.

B. Employees who wish to receive the Hepatitis immunizations may arrange for them through his/her own physician or may receive them through the County Health Services Department. Employees are allowed County time to receive the tests and immunizations. Any employee who wishes to receive the series from the County must advise his/her supervisor who will make arrangements through Health Services.

C. The cost for immunization by the County Health Services Department is paid by the Forensic Services Division. (See Employee Authorization for Immunization and/or Hepatitis B Post Blood Titer form, [SAFF.01](#))

END OF DOCUMENT
I. Emergencies occurring at or around Forensic Services Division (FSD) facilities will be handled in a manner to preserve life and minimize injury and property damage. Division members are responsible for ensuring that emergency notifications are made and first aid or emergency evacuation is initiated.

A. Emergency Telephone Numbers:

1. Contact Emergency Services by dialing 9-911 from a County phone or by dialing 911 from a personal or public telephone. This process ensures connection to the proper Public Safety Answering Point (PSAP).

2. Those callers requiring an ambulance and/or the fire department are switched to Consolidated Fire District dispatch center.

3. Sheriff’s Dispatch is not the PSAP for FSD facilities. Calling Dispatch would result in the call being transferred, which could result in delay and the call location will not appear in the 911 system.

B. For Medical Emergencies:

1. FSD staff members encountering a medical emergency will immediately provide emergency notification.

2. FSD staff trained for medical emergencies (first aid/CPA/naloxone) will provide assistance. Untrained FSD staff must immediately obtain the assistance of the nearest trained person.

3. It is preferable that an additional FSD staff member call for assistance using the 911 system, rather than suspend emergency treatment.

4. Typically, an ambulance and fire rescue will respond to a 911 call for a medical emergency.

5. If the medical emergency is not serious enough to warrant an ambulance, the patient may be transported by a family member.

   a. Under no circumstances should a seriously ill or injured person be allowed to drive.

6. All serious injuries must be reported to Risk Management and CAL OSHA by a Supervisor or Manager. To assess the incident for reporting see CAL OSHA Serious Injury Reporting.

C. For Fire Emergencies:
1. Upon discovery of a fire, FSD staff must immediately notify or designate staff to notify building occupants and call 911.

2. If trained, small fires may be extinguished by using fire extinguishers that are distributed in marked locations at each FSD facility. If danger to the occupants exists, they must be evacuated according to the emergency evacuation plan established for each work site.

D. For Emergencies Requiring Police Assistance:

1. The Summit and Muir facilities are under the jurisdiction of the Martinez Police Department. Property is under the jurisdiction of Concord Police Department. The police are contacted using the 911 System or, when telephone contact is not possible, by activating one of the emergency panic alarms.
   a. When contact is made by telephone, the caller should provide their name, phone number, and a description of the emergency.
      i. An emergency requiring the help of the police department might include a robbery, assault, or bomb threat.

2. If physical harm has or is likely to occur, it may be necessary for a sworn member to take action to subdue an offender prior to the arrival of the Police Department.
   a. Any action by a Division member must be appropriate for the incident and must not further endanger others.
   b. The Patrol and Investigation Divisions often have sworn personnel nearby and they may be a rapid source of aid for the Muir facility.

3. In the event that a bomb threat is received, the employee should refer to Department Policy 1.06.23 Major Disaster Response for a list of questions to ask the caller.

E. For Blackout Procedures:

1. Although blackouts may or may not be considered an emergency, all Division staff should be prepared for anticipated and unanticipated blackouts.

2. Plans and procedures are prepared for each Division facility consistent with the Contra Costa Emergency Management Plan. See SAF.26, SAF.27, and SAF.28 for Blackout Policy and Procedure for Muir, Summit and Property facilities.

F. For Notification:

1. As soon as practical, emergency notifications must be made to management (supervisors, managers, chief and assistant sheriff) advising them of the situation.

END OF DOCUMENT
I. BLACKOUT POLICY AND PROCEDURE
FOR FORENSIC SERVICES DIVISION
Muir Laboratory 1960 Muir Road, 2nd Floor, Martinez

II. GENERAL
A. The Drugs, Alcohol and Toxicology Laboratory (aka the Muir Lab) is located at 1960 Muir Road at the intersection of Glacier Drive and Muir Road on the 2nd floor of the Sheriff's Coroner's Office. The two-story building is located in the North central part of Contra Costa County approximately 1/2 mile from the junction of Highway 4 and I680.

B. There are approximately 15 employees assigned to the Lab typically during business hours (Monday through Friday, 0800 - 1700 hours) and the area of the Lab includes 10,080 square feet.

C. The facility is currently exempt from rolling blackouts by virtue of being designated in a "Block 50" grid. This designation is due to the facility housing law enforcement services but may change as PG&E reevaluates its exempt blocks. Additionally a generator backs up limited areas of the facility. This is a 400 kW generator that is shared with the Field Operation Building (1980 Muir Rd). This generator is maintained by General Services Division and has a fuel capacity of 10,000 gallons of diesel in an underground storage tank. The generator is routinely checked and all equipment that utilizes electricity has been verified to operate in a normal manner. The generator automatically starts when the power is shut off.

D. All employees shall be issued a copy and shall be aware of the contents of this plan. The Forensic Manager shall be responsible for updating and revising this plan.

III. Communications
A. Forensic Manager Danielle Adams is designated the Energy Contact person with the Forensic Supervisor as the alternate.

B. The Manager and the Supervisor shall monitor KCBS radio on days when a blackout is likely. They shall relay information regarding pending blackouts to all occupants on the second floor of the building. If other occupants become aware of pending blackouts, they shall also relay the information to all occupants.

IV. Communications at Worksites
A. Outlook email system (Microsoft OWA 365) shall be the primary means to notify employees of an anticipated blackout. Employees should post notices, outside the entrance door of the laboratory if they are unable to keep appointments due to blackouts.
B. All occupants shall review Emergency Action and Fire Prevention plans posted next to the Safety Bulletin Board located in the main hallway.

C. Employees shall assist all handicapped staff and others that may be in need of assistance if in the building when an unanticipated blackout occurs.

V. Facility Preparedness/Safety

A. This facility is designated in a block 50 grid and as such is exempt for rotating power outages. It is unknown if PG&E will reassign this location to a rotating power outage block. During an unanticipated blackout most functions requiring electricity will be lost.

VI. Emergency Backup Power Generators

A. The facility is equipped with a 400 kW generator that backs up limited areas of the facility. General Services Division (GSD) maintains the generator. The Operating Engineering Section is responsible for maintaining the generator system. GSD performs a quarterly inspection and test under full load conditions. They also inspect bimonthly and test run the unit under no-load conditions.

VII. Uninterruptible Power Systems (UPS)

A. The facility is equipped with a UPS that powers the telephone system. This system has 48 volt batteries on a float charge. The fire and alarm systems also have a battery backup that is maintained by the GSD.

VIII. Telephone Systems

A. The telephone system is backed up by an UPS system. This system will allow the telephones to stay functional for approximately one hour. Thereafter the telephones will support only outgoing calls. The Telecommunications Services of General Services Division is responsible for maintaining the backup system. They perform the semiannual battery inspection.

IX. Fire Control and Suppression Systems

A. The facility is equipped with smoke detectors and a sprinkler system and has numerous wall mounted extinguishers distributed throughout the building. The fire alarms are on a lead acetate rechargeable battery backup that will stay functional for about 24 hours. The General Services Division is responsible for maintaining the fire alarm system. They perform quarterly, semiannual, and annual checks on the smoke detectors, sprinkler system and the backup batteries.

X. Security Systems

A. The facility is equipped with an alarm system that is operated by Denelect 646-6633. Systems are programmed to activate whenever power is lost. The system will stay functional for up to two days without power on a rechargeable battery. The batteries are maintained and checked by General Services Division. Panic alarms will be checked quarterly.

XI. Elevators and Handicapped Egress Routes

A. The facility is a two-story building and has one elevator. During an unanticipated blackout, the generator will not back up the elevator. There is an audible alarm in the elevator that can be activated in emergency situations. A communication will be maintained with the person(s) inside the elevator. If the electricity does not come back on within a half hour General Services Division and Fire Department will be contacted to
evacuate the person(s) inside the elevator. All employees have been instructed in evacuation routes and they are posted at several locations in the corridors. All employees have been instructed to provide assistance to others who are disabled or incapable of moving around the building.

XII. Computer Equipment Rooms
A. There are no environmentally controlled computer equipment rooms in this facility.

XIII. Public Address (PA) Systems
A. The PA is built into the telephone system and operates through individual telephones located throughout the facility. The system operates by lifting the receiver and pressing the * button, and then 31 for the drug section and 32 for alcohol and crime scene evidence area and 33, and 34 for toxicology area.

XIV. Emergency Lighting
A. Emergency lighting is present throughout the building. These lights are routinely checked to ensure functionality. During daylight hours, natural lighting is sufficient to perform some functions in most parts of the buildings when the blinds are open.

XV. Work Practices
A. Advance Planning for Work Activities
   1. Most of the work in the building requires electricity and it would not be possible to continue performing normal work duties in the event of blackouts.

B. Secure Work Areas - Advance Notice of Blackouts
   1. Surge protectors are in place on most computers and analytical instruments.
   2. All employees have been instructed to cut down on electricity usage and use only necessary equipment during rolling blackouts to help alleviate power shortages even though the facility is located within Block 50.
   3. All employees have been instructed to save data frequently and to ensure that their equipment is connected to a surge protection unit, if possible.
   4. The Energy Contact or alternate will monitor KCBS (740 AM) for updates on outages.
   5. The Site Facility Manager will email or telephone the Chief or his/her designee. The Chief or designee will forward on the info to the Assistant Sheriff, updating the work-site safety/hazard status.

C. Secure Work Areas - No Advance Notice of Blackouts
   1. All employees have been instructed to notify all occupants of the building to ensure that everyone is made aware of any blackout situation.
   2. All employees have been instructed to check walkways, bathrooms, and other areas for trip-fall victims and to arrange for needed medical attention or first aid.
   3. All employees have been told to open blinds to provide natural lighting.
   4. All employees have been instructed to ensure that all equipment and machinery that is in operation be shut down if necessary and secured.
5. All employees have been instructed to account for all staff, clients, and visitors and to move to safe areas if necessary.

6. All employees have been instructed to monitor KCBS (740AM) for updates on outages.

7. Site Facility Manager will email or telephone the Chief or his/her designee. The Chief or designee will forward the info to the Commander updating the work-site safety/hazard status.

D. Direct/Manage Work Operations During Blackout

1. All employees have been instructed to make appropriate arrangements for reception of clientele or visitors in safe areas and or post appropriate notices regarding access and services if necessary.

2. If there is not enough light to work, all employees have been instructed to move to other areas or other offices that have enough natural light or battery powered light and space.

3. If there is not enough heat or coolness to work, all employees have been instructed to move to offices that have adequate air circulation, room temperature and space.

4. During a blackout all staff shall:
   a. Perform work that does not require electrical equipment, if adequate lighting is available: e.g., sorting, filing, reading, organizing desks and files, purging old records, etc.
   b. Work release: Division Chief will assess impact of blackout on work activities and safety (taking into account potential duration) and make decision whether to close down.
   c. If applicable, the Chief may release personnel under provisions of Contra Costa County Administrative Bulletin 316, Timekeeping in Emergency Situations.
   d. Division Chief or designee shall keep management advised, through chain of command, of:
      i. Blackout duration
      ii. Building safety
      iii. Work operation
      iv. Division Chief shall continue to monitor building/staff/client safety.
      v. Division Chief shall maintain essential services by invoking Emergency/Disaster Plans(s), if necessary.

E. Closing Facility

1. The Division Chief or designee has authority to evacuate the building in a local emergency. He/she will usually have the most updated information about the emergency and if closing the building will:
   a. Direct notices be posted notifying potential visitors or public of circumstances.
b. Ensure that data is saved, if possible.

c. Issue orders to staff and clarify how to report release time.

d. Assure building is secured.

F. Resumption of Normal Operations after Restoration of Power

1. Upon resumption of normal operations after restoration of power:

   a. Employees will be advised of the all-clear notice and they may notify clients with appointments.

   b. Posted notices will be removed and the Chief or his/her designee shall be advised.

   c. Equipment will be restarted, if it is auto shut off, and a survey of safety status of building and equipment shall be made.

   d. Any emergency supplies and equipment, that was utilized, shall be returned to its proper location.

   e. Employees will be accounted for and shall assume normal work activities.

END OF DOCUMENT
I. BLACKOUT POLICY AND PROCEDURE: FORENSIC SERVICES DIVISION

Summit Center: 2530 Arnold Drive, Suite 200, Martinez, CA 94553

II. GENERAL INFORMATION

A. A rotating outage is also called a rolling blackout, and it is when power is cut deliberately in order to reduce the strain on an electricity grid or generating system. Rotating outages usually happen when demand grows faster than supply, but they can also stem from production issues, a shortage of fuel, and outdated grids.

Rotating outages are deliberate actions and are much less likely to cause damage to the power grid than an unexpected power outage. Power companies use rotating outages only as a last resort, and try to cut power to the least number of customers. Depending on the location of the rotating outage, the length of time may greatly vary.

The power grid is continually monitored, if an increase in demand is noticed an announcement asking customers to decrease power usage may occur to help prevent a rolling blackout. If the power supply goes below a critical level, the monitoring agency will use rotating outages or brownouts. These "roll" in order to ensure that power is not cut to a large section of the grid at any one time.

Power customers are divided into prioritized blocks. These are evenly distributed across the grid, to ensure that power is not cut to an entire community. This is done for safety reasons, as there has been established a link between long power outages and increased crime. Usually, hospitals and fire/police stations are not affected by rotating outages. California is known for rotating outages, however, there are exempt areas referred to as "Block 50".

B. The Criminalistics Section of the Forensic Services Division is located on the second floor (24,000 square feet) of the Summit Center at 2530 Arnold Drive, Suite 200, Martinez, CA. The Summit Center is a multilevel structure located in North Central Contra Costa County just North of Highway 4 and I680. This facility is located in a "Block 50" grid and should be exempt from rolling blackouts.

C. The facility does have a backup generator that during a power outage operates the elevators, and supplies power to select building occupants. The crime laboratory does not receive power from the backup generator.

D. Approximately 30 employees are assigned to the Criminalistics Section. Employees will be responsible to acknowledge that they have read and reviewed the blackout policy and procedures.
E. The Criminalistics Section Forensic Manager is responsible for updating and revising this plan.

III. Communications

A. The Criminalistics Section Forensic Manager is designated the Energy Contact person with the Unit Supervisors serving as alternates.

   1. KCBS Radio (740) shall be monitored on days when a blackout is likely, alternate monitoring may be done using the internet. Information regarding pending blackouts will be relayed to staff.

IV. Communications at Worksites

A. The email system shall be the primary means to notify employees of an anticipated blackout. The floor paging system may also be used.

B. Employees should call or post notices to all members of the public if they are unable to complete meetings or appointments due to blackouts.

C. Employees shall be familiar with emergency action/fire/evacuation plans posted on the Safety Bulletin Board.

D. If an unanticipated blackout occurs, employees shall assist handicapped staff or others that may need assistance.

V. Facility Preparedness/Safety

A. Currently, this facility is located in a "Block 50" grid and should be exempt from rolling blackouts, however, PG & E can reassign this location to a rotating power outage block.

VI. Emergency Backup Power Generators

A. The facility is equipped with an emergency backup power generator that operates the elevators and select building occupants. The Crime Laboratory (2nd floor-Suite 200) is not supported by the generator.

VII. Uninterruptible Power Systems (UPS)

A. Select equipment within the Biology and Latent Units are equipped with a UPS.

VIII. Telephone Systems

A. The telephone system will not support calls during a blackout, however, mobile phones will be operational.

IX. Fire Control and Suppression Systems

A. The facility is equipped with a sprinkler system and has numerous wall mounted extinguishers distributed throughout the building. The fire control system is checked annually by the Contra Costa County (CCC) Public Works Department and Fire Protection to ensure it is functioning properly.

X. Security Systems

A. The facility is equipped with an alarm system that is operated by Denelect 925-646-6333. Systems are programmed to activate whenever power is lost. The alarm system is checked annually by the CCC Public Works Department to ensure it is functioning properly.

B. The facility has touch keypads at each of the three exits locations.
XI. Elevators and Handicapped Egress Routes
   A. The facility is a four-story building and has two elevators. There is an audible alarm in the elevator that can be activated in emergency situations. The elevator call box will connect to Sheriff's Dispatch, and communication will be maintained with the person(s) inside the elevator during an emergency. It is expected that the generator will maintain elevator operations during a power outage, however, if the elevator is not operational for a 30 minutes, CCC Public Works and Fire Department will be contacted to evacuate the person(s) inside the elevator. All employees shall follow the evacuation plan; the evacuation routes are posted at each exit. All employees have been instructed to provide assistance to others who are disabled or incapable of moving around the building. Wheelchair and handicap access ramps are located on the main floor.

XII. Computer Equipment Rooms
   A. There are two data rooms that are environmentally monitored on the floor.

XIII. Public Address (PA) Systems
   A. The PA is built into the telephone system and operates through individual telephones located throughout the facility. The system operates by lifting the receiver and pressing #200.

XIV. Emergency Lighting
   A. Emergency lighting is present within the building. During daylight hours, natural lighting is sufficient to perform some functions in most parts of the building when the blinds are open.

XV. Work Practices
   A. Advance Planning for Work Activities
      1. Most areas in the building would be inadequate to continue performing normal work duties in the event of blackouts.
   B. Secure Work Areas - Advance Notice of Blackouts
      1. Surge protectors are in place on most computers and technical instruments.
      2. All employees are instructed to cut down on electricity usage and use only necessary equipment during rolling blackouts to help alleviate power shortages even though the facility is located within Block 50.
      3. All employees are instructed to save data frequently and to ensure that their equipment is connected to a surge protection unit, if available.
      4. The Forensic Manager or alternate will monitor KCBS radio (740 AM) or internet source for updates on outages.
      5. The Forensic Manager will inform the Chief or his/her designee of a blackout. The Chief or designee will forward on the info through chain of command updating the work-site safety/hazard status.
      6. Employees are instructed to take actions to protect, preserve and safeguard vital records and data.
   C. Secure Work Areas - No Advance Notice of Blackouts
1. Employees are instructed to notify the occupants of the laboratory to ensure everyone is made aware of the situation.

2. Employees are instructed to check walkways, bathrooms, and other areas for trip-fall victims and to arrange for needed medical attention or first aid.

3. Employees are instructed to open blinds to provide natural light, and to use flashlights for non-lighted areas.

4. Employees are instructed to ensure that all equipment and machinery that is in operation be shut down if necessary and secured.

5. Employees are instructed to account for all staff, clients, and visitors and move to safe areas, if necessary.

6. Employees are instructed to monitor KCBS Radio (740) or internet source for updates on outages.

7. The Forensic Manager will inform the Chief or his/her designee of a blackout. The Chief or designee will forward on the info through chain of command updating the work-site safety/hazard status.

D. Direct/Manage Work Operations During Blackout

1. Employees are instructed to make appropriate arrangement for reception of clientele or visitors in safe areas and or post appropriate notices regarding access and services, if necessary.

2. If there is not enough light to work, all employees have been instructed to move to other areas or other offices that have enough natural light or battery powered light and space.

3. If not enough heat or air conditioning to work, all employees are instructed to move to offices that have adequate air circulation, room temperature and space.

4. During a blackout staff shall:
   a. Perform work that does not require electrical equipment, if adequate lighting is available: e.g., sorting, filing, reading, organizing desks and files, purging old records, etc.

E. Work release

1. Division Chief will assess impact of blackout on work activities and safety (taking into account potential duration) and make decision whether to close down.
   a. If applicable, the Chief may release personnel under provisions of Contra Costa County Administrative Bulletin 316, Timekeeping in Emergency Situations.
   b. Division Chief or designate shall keep management advised, through chain of command, of:
      i. Blackout duration
      ii. Building safety
      iii. Work operation

2. Division Chief shall continue to monitor building/staff/client safety.
3. Division Chief shall maintain essential services by invoking Emergency/Disaster Plans(s), if necessary.

F. Closing Facility

1. The Division Chief or designate has authority to evacuate the building in a local emergency. He/she will usually have the most updated information about the emergency and if closing the building will:
   a. Direct notices be posted notifying potential visitors or public of circumstances.
   b. Ensure that data is saved, equipment is shut down, turned off and secure.
   c. Issue orders to staff and clarify how to report release time.
   d. Assure building is secured.

G. Resumption of Normal Operations after Restoration of Power

1. Upon resumption of normal operations after restoration of power:
   a. Employees are advised of the all-clear notice and they shall notify clients with appointments.
   b. Posted notices will be removed and the Chief or his/her designee shall be advised.
   c. Equipment will be restarted and a survey of the safety status of the building and equipment shall be made.
   d. All emergency supplies and equipment shall be returned to its proper location.
   e. Employees will be accounted for and shall assume normal work activities.

END OF DOCUMENT
BLACKOUT POLICY AND PROCEDURE
FORENSIC SERVICES DIVISION
Property & Evidence Services Facility
2099-D Arnold Industrial Way, Concord, CA

I. Policy: Staff are responsible for being aware of contents of this plan. The Director of Property and Evidence Services will be responsible for updating and revising this plan.

A. General

1. The Property and Evidence Services Facility is located at 2099-D Arnold Industrial Way, Concord. It is a brown wood and concrete building located in the North Central part of Contra Costa County approximately 2 miles east from the junction of Highway 4 and Interstate 680.

2. There may be up to 8 staff assigned to the facility at any given time.

3. The facility consists of approximately 19,000 square feet.

4. The facility is currently exempt from rolling blackouts by virtue of being designated in a "Block 50" grid. This designation may change as PG&E reevaluates its exempt blocks.

B. Communications

1. The Director of Property and Evidence is the designated Energy Contact person. In the absence of the Director, their designee is the alternate Energy Contact person.

2. The Energy Contact person shall monitor KCBS radio on days when a blackout occurs. They shall relay information regarding pending blackouts to all occupants in the building.

3. If other occupants become aware of pending blackouts, they shall relay the information to all occupants.

C. Communications at Work sites

1. Outlook e-mail system shall be the primary means to notify employees of an anticipated blackout called a brownout (not blackout).

2. All employees shall review emergency action/fire/evacuation plans posted on the Safety Bulletin Board located in the main hallway.

D. Facility Preparedness/Safety
1. This facility is designated in a block 50 grid and as such is exempt for rotating power outages. It is unknown if PG&E will reassign this location to a rotating power outage block.

2. During an unanticipated blackout, all functions requiring electricity will be lost.

E. Emergency Backup Power Generators

1. The facility is not equipped with an emergency backup power generator.

F. Uninterrupted Power Systems (UPS)

1. The facility is equipped with a UPS.

G. Telephone Systems

1. The telephone system will support outgoing calls only during a blackout.
2. If the telephone system is not available, cell phones will be used to communicate outside the facility.

H. Fire Control and Suppression Systems

1. The facility is equipped with a sprinkler system and has numerous wall mounted extinguishers distributed throughout the building.

I. Security Systems

1. The facility is equipped with an alarm system that is operated by Denelect (925) 935-2680. Systems are programmed to activate whenever power is lost.
2. The alarm system is checked quarterly to ensure it is functioning properly.

J. Elevators and Handicapped Egress Routes

1. The facility is a one-story building and does not have elevators.
2. Staff have been instructed in evacuation routes and they are posted on the Safety Bulletin Board.
3. Staff have been instructed to provide assistance to others who are disabled or incapable of moving around the building.
4. Wheelchair and handicap access ramps are located outside the entry.

K. Computer Equipment Rooms

1. There are no environmentally controlled computer equipment rooms in this facility.

L. Emergency Lighting

1. Emergency lighting is present in the office and warehouse.
2. These lights are routinely checked to ensure they are functioning.
3. Staff have been supplied with flashlights at each of their desks.

M. Work Practices

1. Advanced Planning for Work Activities
a. Most areas in the building would have inadequate lighting to continue performing normal work duties in the event of blackouts, with the exception of the front office.

2. Secure Work Areas - Advance Notice of Blackouts
   a. Surge protectors are in place on all computers and technical instruments.
   b. Staff have been instructed to cut down on electricity usage and use only necessary equipment during rolling blackouts to help alleviate power shortages even though the facility is located within Block 50.
   c. Staff have been instructed to save data frequently and to ensure that their equipment is connected to a surge protection unit.
   d. The energy contact or alternate will monitor KCBS (740 AM) for updates on outages.
   e. The Director or designee will e-mail or telephone the Chief of status during a blackout.
      i. The Chief will forward on the information to the Assistant Sheriff updating the work-site safety/hazard status.
   f. Staff have been instructed to take action to protect, preserve and safeguard vital records and data.

3. Secure Work Areas - No Advance Notice of Blackouts
   a. Staff have been instructed to notify all occupants of Suite D to ensure that everyone is made aware of situation.
   b. Staff have been instructed to account for all staff, clients, and visitors and move to safe areas, if necessary.
   c. Staff have been instructed to use flashlights for non-lighted areas.
   d. Staff have been instructed to check walkways, bathrooms, and other areas for trip-fall victims and to arrange for needed medical attention or first aid.
   e. Staff have been instructed to ensure that all equipment and machinery that is in operation be shut down if necessary and secured.
   f. Staff have been instructed to monitor KCBS for updates on outages.
   g. The Director or designee will e-mail or telephone the Chief of status during blackout.
   h. The Chief will forward on the information to the Assistant Sheriff updating the work-site safety/hazard status.

4. Work Operations During Blackout
   a. Staff have been instructed to make appropriate arrangement for reception of clientele or visitors in safe areas and/or post appropriate notices regarding access and services, if necessary.
   b. If there is an insufficient amount of light to work, staff have been instructed to move to other areas or other offices that have enough natural light or battery powered light to space.
c. If there is insufficient heat or coolness to work, staff have been instructed to move to offices that adequate air circulation, room temperature and space.
d. During a blackout all staff shall perform work that does not require electrical equipment, if adequate lighting is available: e.g., sorting, filing, reading, organizing desk and files, purging old records, etc.

5. Work Release
   a. The Chief will assess impact of blackout on work activities and safety (taking into account potential duration) and make decision whether to close down.
   b. If applicable, the Chief may release personnel under provisions of Contra Costa County Administrative Bulletin 316, Timekeeping in Emergency Situations.
   c. The Chief shall keep management advised, through chain of command, of: blackout duration, building safety, and work operation.
   d. The Chief shall maintain essential services by invoking Emergency/Disaster Plan(s), if necessary.

6. Closing Facility
   a. The Chief has authority to evacuate the building in a local emergency. The Chief will usually have the most updated information about the emergency and if closing the building will:
      i. Issue orders to employees and clarify how to report release time.
   b. The Director or designee will:
      i. Ensure that data is saved, equipment is shut down, turned off and secured.
      ii. Ensure the building is secured.

7. Resumption of Normal Operations after Restoration of Power
   a. Upon resumption of normal operations after restoration of power:
      i. Staff will be advised to the all-clear notice.
      ii. Equipment will be restarted and a survey of safety status of building and equipment shall be made.
      iii. All emergency supplies and equipment shall be returned to storage.
      iv. Staff will be accounted for and shall assume normal work activities.

END OF DOCUMENT
I. In recognition of the high possibility of a serious earthquake in Contra Costa County, Division staff will take care to ensure that objects likely to cause serious injury are secured and will know the correct actions to take in the event of an earthquake.

A. Because of the close proximity of the laboratory to a major earthquake fault, it is likely that the laboratory staff will experience a serious earthquake some time in the future.

B. Earthquake Preparedness: Staff members should take action prior to an earthquake to minimize injury from objects within a building and they can act during an earthquake to reduce the possibility of serious injury.

C. In order to protect laboratory employees and visitors, it is necessary for all staff to observe the following safety guidelines:

1. All tall furniture must be secured in such a way to avoid tipping onto someone or across an emergency exit route.
   
a. Any employee who notices an item such as a bookcase, coat rack, cabinet, etc. which is not bolted to a wall or is not otherwise stabilized must bring it to the immediate attention of his/her supervisor.

2. Heavy items must not be stored on high shelves, especially above a sitting area or aisle, unless they are secured or restrained.

3. All file cabinets higher than sitting height must have thumb-latches which prevent the drawers from opening freely.
   
a. As an alternative, those without thumb-latches may have restraining bars or locks which are engaged at all times except when the files are being accessed.

4. All chemicals must be stored on shelves with restraining devices or in cabinets with doors.

5. Compressed gas cylinders must be secured at all times.

6. Exit aisles must be kept free of debris and items at all times.

7. Employees should know where to turn off gas and electricity in those locations where the utilities are accessible, should it be necessary.
   
a. This is indicated on the posted emergency equipment diagrams at each location.

8. Employees must be familiar with the emergency evacuation routes and assembly areas posted at each laboratory location.
9. At least one flashlight will be available at each location for use in an emergency. Employees must not remove these flashlights except in an emergency.

D. Events during an Earthquake: Should an earthquake occur during working hours, employees should expect any or all of the following:

1. An interruption in gas, electricity and water services
2. A loss of telephone communications
3. Possibility of a fire
4. Injuries
5. Lack of transportation.
   a. These events may require any employee to take emergency action. Every employee is expected to exercise good judgment in responding to these emergencies.
   b. If there is serious damage to the County, sworn members may be called upon to help staff other divisions or to render emergency services to citizens. Employees must remain available for such assignments.
   c. If roads are damaged, employees may remain at the laboratory facilities, if safe, until transportation is available.
      i. Because isolation may occur for extended periods, employees may have to share food, water, and other essentials during this time.

E. Earthquake Response Procedures:

1. At the first indication of an earthquake, move to a safe area. If an exit is near, this may be outside. If not, this may be under a desk or table.
2. If the earthquake is severe, move immediately outside as soon as the initial temblor subsides. Help anyone needing assistance to move outside. Aftershocks may cause already weakened buildings or other structures to fall. Do not return to the building until it has been determined to be safe and given instructions by the Building/Floor Warden.
3. If possible, arm the laboratory doors upon evacuation after the temblor passes. If this is not possible, the individual responsible for the laboratory site should designate one or more persons to observe laboratory entrances from a safe location to ensure the integrity of evidence and laboratory records.
4. Report, if possible, to the designated assembly area and, in any event, well away from tall buildings, brick buildings, large glass windows, trees, and downed or overhead electrical lines. Low, wooden buildings are reasonably safe.
5. Those trained in first aid must administer first aid as they are able and when needed.
6. Do not leave the designated assembly area until given instructions by the Floor Warden.
7. Obtain directions from your supervisor for subsequent contact and work assignments before leaving the assembly area.

END OF DOCUMENT
I. All Division members trained in first aid, CPR and naloxone application are expected to take necessary and appropriate first aid measures.

A. First Aid Preparedness

1. Personnel
   a. Department regulations and California standards for peace officers require sworn staff to be trained in administering first aid, including cardiopulmonary resuscitation (CPR). The Forensic Services Division (FSD) also provides sworn staff with naloxone training.
   
   b. Non-sworn Division staff are strongly encouraged to obtain training in first aid, CPR and naloxone.
   
   c. Each FSD location must have at least one staff member trained and have current certification in first aid and CPR.
   
   d. Each laboratory location must have at least one staff member trained and current in naloxone application.
   
   e. Managers are responsible to ensure that trained staff are available at their facilities.

2. Equipment
   a. Each FSD location must have as least one first aid kit.
      i. First aid kits must be easily accessible, and the locations must be designated by placards as indicated in the safety plan.
      ii. The contents of the first aid kits are to be checked monthly by a person designated by the Section Manager and replenished as needed.
   
   b. Each Laboratory should have at least one naloxone kit available for in-house use or to be deployed for field use. The naloxone must be replaced when expired or administered.

3. First Aid Responsibilities
   a. Each employee is expected to perform or seek the correct first aid treatment for his/her own minor injuries such as small cuts, scrapes, or burns. This would include, for example, cleaning, disinfecting, and bandaging minor wounds.
b. Even minor injuries must be reported immediately to the employee's supervisor and the County Accident Report Form (AK-30) completed.
   i. The AK-30 form is provided in the Contra Costa County Office of the Sheriff on the Job Injury Packet.
   ii. If unavailable contact Sheriff's Administration.

c. Visitors to the laboratory who receive minor injuries are to be assisted in obtaining first aid supplies and treatment.

d. The Facility Manager must be notified of an injury to a visitor.

e. In the event of a more serious accident or injury, the first available employee trained in first aid is expected to go to the assistance of the injured person, assess the need for first aid action, and carry out the needed actions, including enlisting the aid of others as needed.
   i. Sworn employees are also expected to administer first aid to the public in an emergency, while on duty, and when medical personnel are not available.

f. Whenever a serious injury or medical emergency occurs (particularly for head injuries or if a person became unconscious or semi-conscious) the injured person must **never** be permitted to drive home or to another location for medical treatment.
   i. If the person appears to recover from the injury, medical evaluation by a physician of his/her choice is strongly encouraged.
   ii. If necessary, the supervisor will notify the Officer of the Day (OD) and prepare Unusual Incident Report.

g. As soon as possible, the employee's supervisor must be notified of the injury and the County Accident Report Form (AK30) must be completed.
   i. Injury resulting in death or requiring hospitalization of more than 24 hours must be immediately reported, by telephone, to Department Administration Personnel Director and to Risk Management during normal business hours. The Supervisor will also immediately notify Cal/OSHA (676-5333) unless the incident is:
      1. an auto accident without any mechanical malfunctions
      2. the result of a criminal act (i.e. Police shooting or an injury directly caused by a police function)
      3. a heart attack

h. Employees must not stay in a dangerous environment (e.g., a building on fire or a room saturated with extremely hazardous chemicals) to help an injured person. The individual should be removed, if possible, to a safe location for treatment. If removal is not possible, rescue may have to await the proper emergency personnel.

i. Special masks have been made available for administering CPR. These masks can help establish airways in persons with facial injuries and will significantly reduce the possibility of exposure to infectious agents while administering CPR.
j. Responsibility for performing first aid is relinquished when all reasonable first aid responses have been performed, medical personnel (e.g., a physician, paramedic, or registered nurse) are available for treatment, or further first aid treatment is not possible. First aid and CPR activities will be performed according to the principles taught in the employee's first aid and CPR classes.

4. First Aid Response by Employees Trained in First Aid:
   a. Check the area and only offer first aid to an injured person if it is safe to do so. If the area is not safe call 911 and report the injury and circumstances.
   b. Upon observing or encountering a serious injury or medical emergency, determine the necessary first aid measures.
   c. Administer emergency CPR and first aid as needed. Seek assistance, if needed, from nearby individuals, but do not leave the injured person or stop CPR to seek help.
   d. If other individuals are present, make sure that someone calls "911" for help. If no one else is present, wait until the injured person has received emergency first aid treatment before calling for help.
   e. Arrange for transfer for medical treatment by relinquishing the person to emergency medical personnel at the injury site or arranging for transportation by another as dictated by the circumstances of the emergency.
   f. Notify the employee's supervisor of the incident or your own supervisor if the injured party is not a laboratory employee.
   g. The supervisor will ensure that the proper records or documents are completed and any necessary notifications are made.

5. Emergency Response - Staff Not Trained in First Aid:
   a. If a serious injury or medical emergency is encountered, notify the nearest available person trained in first aid.
   b. Standby to assist the person performing the first aid as needed.
   c. If no one trained in first aid is immediately available and the person is unconscious or very seriously injured, call "911" and request emergency response. Give the information requested, such as location, nature of the emergency, etc.
   d. Wait with the injured person until help arrives. Reassure the injured person that help is on the way and keep them warm, if needed. Do not move the person or give him/her anything to eat or drink.
   e. If no one trained in first aid is immediately available and the injured person is conscious and indicates injuries are not serious, let him/her guide you in determining the appropriate actions that may be needed.
   f. Notify the injured person's supervisor as soon as possible of the incident. If the injured is not a laboratory employee, notify your supervisor.
   g. The supervisor will ensure that the appropriate records or documents are completed and that any necessary notifications are made.

END OF DOCUMENT
I. A Division employee shall drive a County vehicle or their own vehicle on County business in accordance with State vehicle and Municipal codes to ensure the safety of both the employee and others.

A. Division employees driving County vehicles or their own vehicles for County business, shall possess a valid Driver's license that should be carried at all times.
   1. Division employees shall observe the requirements of vehicle operation and parking procedures per Department policy 1.06.51.
   2. Employees shall practice safe and responsible driving and wear seat belts provided.

B. Employees will not use cell phones unless it allows hands-free speaking and listening while driving.

C. Employees will not "text" or read e-mail from hand-held devices while driving.

D. Any Division employee who discovers a safety defect in a County car, such as a broken seat belt, a low tire, poor braking, etc., must bring this to his/her supervisor's attention as soon as practical. Employees are expected to cooperate in having Division cars serviced to keep them in optimum condition.
   1. Division vehicles are equipped with basic safety equipment such as
      a. Emergency Vests
      b. Fire Extinguisher
      c. Basic First Aid Kit
      d. Emergency Tool (including flashlight)
      e. Orange Cone
   2. Vehicle safety equipment will be checked on a quarterly basis.

E. Employees must use care with any cargo, which could pose a hazard to the occupants of a vehicle.
   1. Objects, which could become airborne projectiles in an accident, must be secured, placed in the trunk, or transported in a vehicle behind a safety screen.
   2. Heavy objects which could affect maneuvering by shifting must also be secured.
3. Small quantities of hazardous, volatile or explosive chemicals must be secured when transported inside the back portion of a crime scene van.

4. Unexploded bombs may **never** be transported by Division employees.

5. Chemicals shall not be transported by Division employees unless they are collected in small quantities from crime scenes.

END OF DOCUMENT
I. All firearms related to casework will be handled with extreme care in a manner that recognizes the potential for accidental discharge, serious injury or death. Proper handling of firearms evidence is paramount for the safety of all staff. Employees who handle firearms in the course of their work will familiarize themselves with the necessary safe handling practices.

A. Forensic Services Division (FSD) staff required to handle firearms as part of their duties will be trained in the safe handling of firearms. Refer to the Comparative Evidence Technical Unit Manual CE.02 for further information on firearms safety requirements.

B. Packaging containing firearms that are submitted for evidence will be marked that the firearm is unloaded by the agency.
   1. All submitted firearms must display safety information on the packaging indicating the firearm is "UNLOADED".
   2. This may be accomplished utilizing an "UNLOADED" label provided by the laboratory, which includes the identifier of the person rendering the gun safe along with the date this action was performed.
   3. Firearm submissions not bearing this safety information will not be accepted into the FSD.
   4. If qualified FSD staff are available, they may render a firearm safe to expedite the submission process. Otherwise, the agency representative will retain custody of the firearm, return it to the agency, render the firearm safe, and resubmit to the laboratory.

C. Unloaded firearms may be handled like other evidence.

D. In rare circumstances, a loaded firearm will need to be submitted. This should be prearranged with a Firearms Examiner.
   1. The Firearms examiner is contacted and will render the firearm safe. After being unloaded, the firearm can be treated like any other firearms evidence. Refer to the Comparative Evidence Unit for further information about safely unloading a firearm.

END OF DOCUMENT
I. The Office of the Sheriff, in conjunction with State standards, has developed an ergonomic program in order to minimize or prevent ergonomic injuries of county employees. All employees should bring any ergonomic concerns to their Supervisor.

A. If an employee has obtained an ergonomic injury due to job-related repetitive motion injury, they should notify their Supervisor.
   1. The Supervisor should complete the documents outlined in the "On the job Injury Packet" provided by Sheriff's Personnel Services Unit.
   2. The Sheriff's Department, Director of Support Services - Personnel Services Unit, or a designee will coordinate ergonomic accommodation per CCCSO policy 1.07.26.

B. If an employee notices discomfort due to job-related repetitive motions, they should notify their Supervisor for a preventative Ergonomic Evaluation.
   1. An Ergonomic Evaluation Request Form is completed and signed by the Supervisor and Safety Coordinator. The signed form will be sent by the Safety Coordinator to the County Risk Management Department.

C. Risk Management will either provide guidance and the equipment necessary to help with the situation or arrange for an Ergonomic Evaluation, Department policy 1.07.26.

D. An Ergonomic Evaluator will arrange an appointment to conduct an assessment of the employee's work environment. They will make suggestions on proper posture while the employee is working and purchase any equipment deemed necessary.
   1. After the initial evaluation, an Ergonomic Work-Site Assessment Prevention Form and a Workstation Recommendations Approval (WRAP) Form will be sent to the Safety Coordinator and employee's supervisor for approval.
      a. Upon receipt, installation and instruction of equipment/services provided, the Ergonomic Evaluation Follow-up Equipment Acknowledgement Form must be signed by employee.
      b. If there is any problem with the equipment recommended and if the employee feels it is not beneficial to them they should notify their Supervisor.
         i. Most equipment can be returned within 30 days of receipt. The equipment boxes should be retained for that time frame.
         ii. The Ergonomic Evaluator will offer alternatives for the employee.
iii. Staff that are undergoing an ergonomic assessment must complete an employee feedback survey and participate in ergonomic training (an on-line training through TargetSolutions is available).

2. The Ergonomic Evaluator will provide training on the use of the new equipment and upon completion of all recommended changes, will complete all paperwork and close the ergonomic request.

END OF DOCUMENT
I. This Plan applies to all employees work outdoors or indoors when the environmental risk factors for heat illness are present.

A. There is a significant risk of heat illness for employees when the air temperature for the day is 80°F to 90°F or above.
   1. If the humidity is high and the temperature is close to 80°F there may still be a potential for Heat Illness.

B. Employees assigned to the crime scene unit are the employees who may be primarily at risk for heat illness. Although other staff should also be aware of the risk factors associated with heat illnesses.

C. Supervisors and employees are responsible for the following:
   
   1. Assessing Environmental and Personal Risk Factors
      
      a. The environmental risk factors for heat illnesses are likely to be present from the beginning of April through the end of October.
         
         i. Actual weather conditions (e.g., heat index, weather forecast, etc.) should be taken into consideration to determine the actual risk due to exposure to such inclement conditions.

      b. Working conditions, the type of work, workload intensity and duration, and the use of personal protective equipment (PPE) are additional factors that must be considered when departments assess the risk for heat illnesses.

      c. Personal risk factors may include but are not limited to an individual's age, degree of acclimatization, overall health, water consumption, caffeine consumption and use of prescription medications which affect the body's water retention or other physiological responses to the heat.

   2. Drinking sufficient water
      
      a. Forensic Manager overseeing the crime scene assignments must provide adequate supply of drinking water to staff assigned to crime scene response.
         
         i. A minimum of one quart of drinking water per hour must be available to each employee or two gallons per employee for an eight-hour shift, to replace water lost by perspiration.
3. Assuring Access to Shade
   a. If adequate shade cannot be provided by buildings or trees, shade may be provided by a temporary structure. Staff will need to notify and request the Manager in-charge of the operation, as needed.
   b. Vehicle interiors or structures such as sheds are not permissible unless they are air-conditioned or can provide a cooling environment comparable to shade in open air.
   c. Employees who are affected by the heat or exhibit indications of heat illness must be permitted to have access to shade at all times whenever they request a preventative recovery period.
      i. The purpose of the recovery period is to prevent heat illness.
      ii. Recovery Period should be at least 5 minutes.

D. Employees should be aware of the causes, signs and symptoms as well as the treatment for the common types of heat illness.

1. **Heat cramps** are caused by strenuous activity in the heat and increased perspiration. Perspiration depletes the body's salt and moisture. The low salt level in the muscles cause painful cramps. Heat cramps may also be a symptom of heat exhaustion. If heat cramps are suspected:
   a. The employee should stop all activity and sit quietly in a cool place.
   b. The employee should rest and cool down.
   c. The employee should drink cool water (not iced), clear juice or a sports beverage containing electrolytes.
   d. Practice gentle, range-of-motion stretching and gentle massage of the affected muscle groups.
   e. The employee should not return to strenuous activity after the cramps subside as this can lead to heat exhaustion or heat stroke.
   f. If symptoms do not go away in one hour, seek medical attention.

2. **Heat exhaustion** is caused by excessive heat and dehydration. The warning signs of heat exhaustion include: heavy perspiring; paleness; muscle cramps; tiredness; weakness; dizziness; headache; nausea or vomiting and fainting. Symptoms of heat exhaustion may be cool and moist skin, fast and/or weak pulse rate, and fast and shallow breathing. If heat exhaustion is untreated, it may progress to heat stroke. If heat exhaustion is suspected:
   a. The employee needs to stop all activity, get out of the sun and into a shady or air-conditioned location immediately.
   b. The employee should lay down and be helped with elevating the legs and feet slightly.
   c. Loosen or remove clothing.
   d. If possible, the employee should drink cool water (not iced), clear juice or a sports beverage containing electrolytes.
e. The employee should be cooled down by spraying or sponging with cool water and fanning.

f. Seek medical attention.

3. **Heat syncope** is caused by strenuous activity in hot environments and dehydration. Heat syncope can be caused by blood pooling in the legs due to standing still for a long time in a hot environment. It can also be caused by vigorous physical activity for two or more hours before the fainting happens. The risk of developing heat syncope increases when a person has not acclimated to a hot environment. The warning signs for heat syncope include: pale, cool, and moist skin, feeling faint or lightheaded, light-headedness when a person changes position, (e.g. moving from a lying position to a standing position), and being dehydrated. If heat syncope is suspected:

   a. The employee should get out of the sun and into a shady or air-conditioned location immediately.

   b. The employee should lay down and be helped with elevating the legs and feet slightly.

   c. If possible, the employee should drink cool water (not iced), clear juice or a sports beverage containing electrolytes.

   d. The employee should be cooled down by spraying or sponging with cool water and fanning.

   e. Seek medical attention.

4. **Heat Stroke** is caused when the body's mechanism for dealing with heat stress, such as perspiring and temperature control, are lost. The main sign of heat stroke is elevated body temperature, generally greater than 104°F. The warning signs of heat stroke include: red, hot, and dry skin, rapid heartbeat, rapid and shallow breathing, elevated or lowered blood pressure, cessation of sweating, irritability, confusion, or unconsciousness, and fainting. If heat stroke is suspected:

   a. Move the employee out of the sun and into a shady or air-conditioned space immediately.

   b. **Dial 911** from a land-line or call 916-732-0100 from a cellular telephone for emergency medical assistance.

   c. Loosen or remove clothing.

   d. Cool the employee by covering with damp cloths or by spraying with cool water and fanning.

E. Training shall be provided initially on hiring and annually as a refresher. The Training shall include:

1. The environmental and personal risk factors for heat illness.

2. Review of Forensic Services Division's Heat Illness Prevention Plan.
I. Policy: Toxicology analysis is performed on blood and urine specimens from living subjects and post-mortem specimens.

A. The toxicology unit will screen blood and urine samples submitted from antemortem and postmortem cases submitted from police agencies in the Contra Costa County jurisdiction. The agency must request a drug screen by submitting a blood/urine sample in a Blood/Urine for Drugs evidence kit.

1. The toxicology unit routinely screens for methamphetamine, cocaine metabolite, and opiates. Samples submitted for driving offenses and persons crimes (i.e. deaths, assault, sexual assaults, child abuse, etc) are also routinely screened for benzodiazepines and cannabinoids.

2. Positive screens for blood samples should be confirmed and results reported qualitatively or quantitatively.

3. Positive screens for urine samples should be confirmed and results reported qualitatively only.

4. All analysis requested and not performed by the Forensic Services Division will be noted on the report, or forwarded to an outside laboratory as necessary.

B. Terminology

1. The verbs "shall", "must", and "will" indicate mandatory requirements, while "should" is used to denote compelling or recommended practices and "may" is used in the permissive sense.

C. Test Methods

1. The Toxicology Unit will use appropriate methods and procedures for all tests within its scope. (ISO/IEC 17025:2005 5.4.1) These include:

   a. Methods and procedures, see:

      i. Screening samples by Enzyme Immunoassay
      ii. Amphetamine and Methamphetamine Identification in Urine
      iii. Amphetamine, Methamphetamine, MDA and MDMA Identification and Quantitation in Blood
      iv. Cocaine, Benzoylcegonine, Codeine, and Morphine Identification and Quantitation in Urine
      v. Hydrocodone Identification and Quantitation in Urine
      vi. Hydrocodone Identification and Quantitation in Blood
      vii. Oxazepam Identification and Quantitation in Urine
      viii. Diazepam, Nordiazepam, Oxazepam, and Temazepam Identification and Quantitation in Blood
      ix. Gammahydroxybutyrate Identification and Quantitation in Urine
      x. Gammahydroxybutyrate Identification and Quantitation in Blood
      xi. Carboxy-tetrahydrocannabinol Identification and Quantitation in Urine
      xii. Acid/Neutral and Basic Drug Screen in Blood
      xiii. Cocaine and Benzoylcegonine Identification and Quantitation in Blood
      xiv. Opiates and Keto-Opiates Identification and Quantitation in Blood
      xv. THC and metabolites Identification and Quantitation in Blood
      xvi. Comprehensive Benzodiazepine Qualitative Identification in Blood
b. **Sampling of items to be tested**, see:
   i. Performing Immunoassay
   ii. Performing Extractions

c. **Handling of items to be tested**, see:
   i. Evidence Handling

d. **Storage of items to be tested**, see:
   i. Evidence Handling

e. **Preparation of items to be tested**, see:
   i. Evidence Handling
   ii. Performing Immunoassay
   iii. Performing Extractions
   iv. individual extraction procedures

f. **Estimation of uncertainty as well as statistical techniques for analysis of test data**, see:
   i. Uncertainty
   ii. Uncertainty Budget 2016

2. The Toxicology Unit shall have instructions on (ISO/IEC 17025:2005 5.4.1):
   a. **The use and operation of all relevant equipment**, see:
      i. Training
      ii. Care and Maintenance of Equipment
      iii. Balances
      iv. Diluters and Pipettes
      v. Glassware
      vi. pH Meter
      vii. GC/MS Routine Maintenance
      viii. GC/MS Dean Switch
      ix. GC/MS Cleaning the Ion Source
      x. GC/MS Changing the Column
      xi. GC/MS Cleaning the Inlet
      xii. GC/MS Vacuum Pump Maintenance
      xiii. GC/MS Cleaning the Liners
      xiv. GC/MS Using the Software-Comparative Identifications
      xv. GC/MS Using the Software-Quantitative Identifications
      xvi. GC/MS Using the Software-Sequences
      xvii. Instruments-Storage of Data
      xviii. Dynex Operation
      xix. Dynex Maintenance
      xx. LIMS Reporting Results

   b. **And handling and preparation of items for testing**, see:
      i. Evidence Handling

3. All instructions, standards, manuals and reference data relevant to the work of the Toxicology Unit shall be kept up to date and made readily available to personnel through the use of this Technical Unit Manual. (ISO/IEC 17025:2005 5.4.1)
4. All methods shall be documented and the documents readily available for review by laboratory personnel through PowerDMS. See the Division Manual for more information regarding Document Control. (Supplemental 5.4.1.1)

5. Deviation from test methods shall occur only if the deviation has been documented, technically justified and authorized. (ISO/IEC 17025:2005 5.4.1)
   a. See Technical Records

6. A Drug Alcohol and Toxicology (DAT) Handbook has been placed on ARIES, for review by the clients. The handbook includes the services provided by the Toxicology Unit and the equipment and methodology utilized in sample analysis.

END OF DOCUMENT
I. Policy: Laboratory personnel will follow procedures for the selection, ordering, verification and storage of supplies

A. Ordering Supplies-Putting Supplies on the List to be Ordered
   1. General laboratory consumables and supplies may be placed on the order list by any member of the laboratory staff. These consumables and supplies do not affect the quality of the final result.
   2. The following are some examples of consumables that do not affect the quality of the test results:
      a. Gloves
      b. Glass or plastic transfer pipettes
      c. Vials and caps
   3. Supplies which may affect the test result should be placed on the order list by personnel within the unit in which the supplies are to be used. The following is a list of supplies that may affect the test result in Toxicology Unit:
      a. Chemicals used for Toxicology Analysis
         i. The "type" or "grade" of chemicals used in toxicology analysis is specified in the technical unit manual (See Performing Immunoassay and individual extraction procedures). Only the grade of chemical specified should be ordered.
      b. Parts for the GC/MS, Dynex or other equipment. These may be ordered based on part information in the instrument manual(s) (See GC/MS Reference and Dynex References).
   4. The following is a list of supplies and services that can affect the test result in the Toxicology Unit. The suppliers of these supplies and services must be evaluated yearly and the evaluation will be documented:
      a. Certified Reference Material used to prepare standards for confirmations
      b. Calibration services for pipettes, repeat pipettes, and critical volumetric glassware
   5. Supplies may be placed on the order list by any unit analyst.

B. Approval of Orders
   1. The supplies on the "Supply Order List" are inputted into a computer database and retained electronically. The list(s) of supplies to be ordered is printed out.
   2. The list(s) of supplies to be ordered are then given to a Forensic Manager, Supervisor or designee for approval.
      a. Technical approval for supplies that may affect test results will reviewed by a technically qualified individual.
      b. Fiscal approval will be completed by a Forensic Manager.
   3. Any lab staff member or support staff may order supplies from the vendor.

C. Ordering Supplies from the Vendor
   1. After the list(s) of supplies to be ordered have been approved, any lab staff member or support staff may order supplies from the vendor by phone/e-mail. The orders maybe placed:
      a. Using an existing open Purchase Order for vendors or
      b. Using a requisition form by the Account Clerk or
      c. Using the County credit card held by the Account Clerk.
2. After the supplies are ordered, the order information will be entered into the computer database and retained electronically.

3. The approved order lists will be retained electronically.

D. Receiving Supplies

1. Supplies that affect the test result are verified and not used until they have been inspected or verified as being the supply that was ordered.

2. When the consumables or supplies are received by the laboratory, the supplies are unpacked and verified by:
   a. Checking that the packing slip and/or shipping receipt match the item received. This can be done by checking the packing slip and/or shipping receipt against the labels on the supplies.
   b. Checking that the item received match the item ordered. This can be done by checking the supply label or packing slip/shipping receipt against the list of supplies ordered.
   c. The person checking the received supplies will initial the shipping receipt. This paperwork is forwarded to Accounts Clerk.
   d. The information from the list of supplies to be ordered is entered into the supply ordering database and stored electronically.
   e. The individual enters the date items were received/verified and his/her initials indicate when entering the information.

3. The supplies are then put away in a storage location.

4. General laboratory consumables and supplies are stored in the supply room or within the units of the laboratory. Any special storage requirements (refrigeration, storage in flammable or corrosive cabinets, etc.) will be adhered to.

5. Reagents and supplies will be re-evaluated on an on-going basis through the use of controls and intermediate checks.

6. Supplies required for specific instrumentation, chemicals required for certain procedures or supplies that are specifically listed in the method or procedure being used should be given to the lab staff member who ordered that supply item.

7. Reference materials are checked to ensure that the proper traceability paperwork accompanies the item or the traceability paperwork is retrieved from the vendor electronically. Reference materials (standards) are stored according to the storage recommendations on the package.
   a. The traceability paperwork (Certificates of Analysis or other verification paperwork) are maintained by the Toxicology Unit.
   b. Consumables provided by the manufacturer of the equipment being used - Manufacturer's consumables quality documentation is needed to ensure the quality of product is adequate for the testing being performed.
   c. Once a product is evaluated and approved for use, for example through validation or as supplied for use with an instrument, it will be ready for use in casework and may be ordered as needed.

E. Discrepancies

1. If there is any discrepancy between the item ordered and the item received, the person ordering supplies will notify the vendor of the discrepancy and the item will not be used by the laboratory. The item will be returned and exchanged for the proper item.

2. If there are any problems exchanging the item for the correct item, the Forensic Manager or Supervisor will be notified.

3. If the item ordered is found to be defective or does not perform as expected it will not be used for casework.

4. Actions: Taking any actions arising from evaluations, monitoring of performance, and re-evaluations of the external providers. Actions may include ensuring the correct services or supplies are received, issues are resolved, or monitoring that services and supplies meet the needs of the unit.

F. Sole Source Vendors

1. Sole Source Vendors may be vendors that supply the lab with items that another vendor cannot readily supply. This may be because procedures were validated with items specific to a vendor (eg. immunoassay plates). The Department Account Clerk is required to maintain a justification for sole source vendors.
2. For the Toxicology Unit, a reference material used for confirmation is considered a supply that affects the quality of a test.

3. The laboratory chooses suppliers of reference materials by a number of factors including (but not limited to) price, ease of ordering, vendors with whom we have open purchase orders.
   a. The vendors commonly used to order drug reference materials are located in the supply ordering database.

4. Vendors that provide a service that may affect the test result are:
   a. Rice Lake Weighing Systems or equivalent for balance, pipette, diluter, titrator calibration.
      i. Calibration services provided from an ISO 17025 vendor - Certificate of Calibration is needed for evaluation and documentation when calibration occurs

5. The Unit is responsible for the evaluation, selection and monitoring of performance, and annual re-evaluation of external providers.
   a. Criteria for evaluation, selection, monitoring of performance, and re-evaluation of the external providers. For example:
      i. Checking a scope document to ensure the calibration being requested is within the scope of the vendor
      ii. Checking an accreditation certificate to ensure that accreditation has not lapsed
      iii. Checking that quality controls or standards meet the performance criteria of the equipment or method
      iv. Ensuring that a certificate is checked after the expiration date before ordering additional supplies or service

END OF DOCUMENT
I. Kits for the collection of blood and urine samples for drugs are provided by the Forensic Services Division and must be used by submitting agencies to ensure proper preservation of the samples. Kits are available at no charge from the Division during normal working hours.

A. Two types of kits are provided by the Forensic Services Division for the submission of blood and urine samples for alcohol and/or drugs:

1. Blood Sample for Alcohol/Drug Analysis
2. Urine Sample for Alcohol/Drug Analysis

B. The containers in each of these kits contain particular anticoagulants and/or preservatives intended to ensure the quality of the sample for analysis. Failure to use the proper anticoagulant or preservative can reduce the reliability of test results. Preservative testing may be performed upon request by an outside laboratory.

C. Each kit is assigned a unique container number that can be found on the kit envelope and on the label(s) for the container(s). These container numbers are intended to prevent accidental mix-up of samples from different subjects. All kits are sealed when distributed to ensure that the contents are intact. Any kit, which is not sealed, should be returned to the Forensic Services Division.

D. Blood Sample for Drug Analysis

1. These kits are to be used for the collection of blood samples for testing for alcohol and/or drugs, even if the analysis is to be performed by an outside laboratory.

2. Each vacuum vial for blood collection has an expiration date, after which the vacuum in the vial cannot be guaranteed. Vials without a vacuum will not pull the blood from the vein into the vial. The vials usually maintain their vacuum well beyond the expiration date and expired kits may be used in an emergency. However, expired kits should be returned unused to the Forensic Services Division to reduce the chance of encountering a vial that has lost its vacuum.

E. Urine Sample for Drug Analysis

1. The "Urine Sample for Alcohol/Drug Analysis" kit is contained in a manila-colored envelope. For drug analysis, the kit is intended to collect the initial void urine sample of the subject. Voiding or emptying of the bladder is necessary if a subsequent urine sample will be collected for alcohol analysis. If the void sample was not collected, the intended sample for alcohol analysis may also be used for drug analysis.

2. Urine collection kits do not have an expiration date. They can be used indefinitely.

F. Using the Kits

1. Instructions for the use of the kits can be found on the back of each envelope. The instructions are self-explanatory and should be followed carefully to ensure proper collection of the sample and proper handling of the paperwork.

2. Any samples that are received not in compliance with these prescribed collection, withdrawal, handling, and preservation instructions shall still be analyzed, but the deficiency shall be described in laboratory records. (ISO/IEC 17025:2005 5.8.3)

G. Disposition of Samples After Examination

1. Blood and urine samples tested for drugs only may be returned immediately after analysis to the submitting agency for retention. Samples may be stored at room temperature. Those samples from driving cases which were also tested for alcohol will be stored in the laboratory and returned to the submitting agency after one year from the collection date. If a sample is not returned to the submitting agency, the disposition of evidence will be indicated in the notes.
II. The Forensic Services Division provides contract services for blood withdrawal on criminal cases, officer involved incidents and to all law enforcement agencies in Contra Costa County. The cost of the blood withdrawal is charged to the requesting agency.

A. As a convenience to our client agencies, the Forensic Services Division has arranged for blood withdrawal in Contra Costa County.

1. The Forensic Services Division contracts with a private group of phlebotomists (blood technicians) to provide blood withdrawal for law enforcement. The draws may be requested at police agencies, hospitals and any other location in Contra Costa County. Phlebotomists are on-call around the clock. Their services are used most frequently in the following instances:
   a. To draw blood at the Martinez Detention Facility
   b. To draw blood at hospitals
   c. To draw blood at police agencies with holding cells and who do not transport subjects immediately to the Martinez Detention Facility, and
   d. On DUI and other criminal cases
   e. HIV Testing in criminal cases

2. The contract blood technicians consider cooperation to be tacit consent. The contract blood technicians will participate in forced blood withdrawals when deemed necessary by the police agency. The forced draw is also performed in compliance with a court order specifically directing that the sample shall be taken with force when necessary.

3. The cost of blood withdrawal is borne by the agency requesting the sample. The contract company bills the Forensic Services Division for all blood withdrawals. The charge to the Division is passed on to the requesting agency in quarterly bills.

B. Procedures for Blood Withdrawal

1. Obtaining a Blood Withdrawal from a Contract Blood Technician
   a. Call Central Medical Laboratories (CML) dispatch at (800) 288-4441 any time 24 hours a day, and ask for the on-call blood technician.
   b. Give the dispatcher your name, location, and name of the subject.
   c. If circumstances arise whereby the contract blood technician is no longer needed, call dispatch and notify them immediately. Agencies will have to pay for a call-out, even if no sample is drawn, if the blood technician is in transit.

2. Blood Withdrawal Procedures for Alcohol/Drug Testing
   a. Use a blood withdrawal kit distributed by the Forensic Services Division only. They can be found in the Alcohol Testing Room of the MDF and are carried by the contract blood technicians.
   b. The requesting officer completes the information on the front of the kit envelope, in full.
   c. On driving offenses, the blood withdrawal may be performed only by a licensed doctor, nurse, medical technologist, biotechnologist, paramedic or phlebotomist. Any qualified medical personnel may perform blood withdrawal in other types of cases.
   d. Using the contents of the kit, the person withdraws the blood according to the directions on the back of the envelope. If the sample is to be analyzed for drugs, two additional vials of blood are desirable using the same type of grey top vials. The extra supplies are carried by the blood technicians.
   e. The blood withdrawal must be witnessed by an officer. He/she must watch carefully enough so that he/she can testify in court regarding the procedures used. The person performing the blood withdrawal may refuse to perform the withdrawal if it is not witnessed.
   f. The person drawing the blood completes the information required on the labels for the vials, attaches them to the vial, and gives the vials to the requesting officer.
   g. The person drawing the blood completes the Declaration form enclosed in the kit.
   h. The person drawing the blood retains his/her copy of the Declaration, and gives the other copies to the requesting officer.
   i. The requesting officer places the seals over the tops of the vials and initials them and the vial labels.
j. The copy of the Declaration for the District Attorney's Office is submitted by the requesting officer with the filing paperwork.

k. The requesting officer places the seal over the envelope flap and initials it.

l. The kit is submitted to the Drugs Alcohol and Toxicology Section, Monday through Friday between 8:00 a.m. and 5:00 p.m. or is placed in the refrigerated drop box in the Breath Testing Room at the MDF or at Property and Evidence Services if access is authorized to that facility.

   a. Blood tubes/kits will be distributed by the County Health Services Department to the on call contract blood withdrawal technicians.

   b. Blood tubes/kits will not be submitted to the Forensic Services Division. The submission will be given directly to the County Public Health Laboratory at the Contra Costa Regional Medical Center in Martinez or placed in the refrigerator marked for Health Services in the MDF Breath Testing Room.

III. Requests for the analysis of blood and urine samples for alcohol and/or drugs are made by properly completing the front of the blood and urine collection kits and submitting them to the Forensic Services Division.

   A. The Forensic Services Division performs drug analysis on blood and urine samples or forwards samples to an outside laboratory for drug analysis primarily for criminal cases.

      1. Coroner's samples which include blood, urine and body fluids/tissues are also accepted and may be forwarded to an outside laboratory for analysis.

      2. Cases involving probation, parole violations or inmate screening are not routinely accepted by the Forensic Services Division.

   B. Completing the information required on the front of a kit and submitting it to the Drug, Alcohol, and Toxicology Section of the Forensic Services Division is a sufficient request for analysis in most cases.

      1. The Coroner's cases must have a "Coroners Office Toxicology Request Form" attached. The information requested on the envelope must be completed in full.

   C. Unless otherwise marked on the kit, a Blood Sample for Alcohol/Drug Analysis kit will be tested for alcohol and drugs. If a drug analysis only is needed, this should be clearly noted in the check box near the top of the envelope by the requesting person or by the submission of a general examination request form.

      1. Kits requesting analysis for both alcohol and drugs in a case of driving under the influence should be examined for alcohol first.

      2. Drug analysis will also be performed, if requested, in this laboratory or forwarded to another laboratory for testing as per arrangements made with the client agency or with an authorization from laboratory manager or supervisor.

   D. Blood and urine samples may be submitted to the Drug, Alcohol, and Toxicology Section Monday through Friday between 8:00 a.m. and 5:00 p.m. or placed in the drop box inside the refrigerator of the Alcohol Testing Room at the Main Detention Facility in Martinez 24 hours per day. Blood and urine samples can also be submitted at the Property and Evidence Service Facility in Concord, if permitted access to the building. Samples should be submitted as soon as possible after collection to avoid degradation of the drugs or alcohol. If a timely submission is not possible, blood and urine samples should be refrigerated, not frozen, until they can be submitted.
I. The following is a list of abbreviations approved for use in the Toxicology Unit.  *(Supplemental 4.13.2.13)*

A. Abbreviations for commonly used terms in the forensic science community may not be listed. An explanation of the abbreviation will be included if the abbreviation is unique to this Laboratory.

### I. Policy:

The following are forms used in the Toxicology. Forms may be controlled (required for use) or non-controlled (suggested for use but not required).

A. Controlled forms are located on PowerDMS and must be used.
   1. Toxicology Authorization Checklist

B. Non-controlled forms may be located on PowerDMS or maintained within the Toxicology Unit and the minimum information that must appear on the form is listed below.
   1. Front of blood sample for alcohol/drug analysis kit
   2. Back of blood sample for alcohol/drug analysis kit
   3. Front of urine sample for alcohol/drug analysis kit
   4. Back of urine sample for alcohol/drug analysis kit
   5. GC/MS Maintenance/Usage Log
      a. Number and/or serial number of instrument
      b. Description of maintenance being performed (e.g. inlet change, cleaned source, etc.) and initials of person performing maintenance and date maintenance performed
      c. For sequences, the name of the sequence and initials and date
   6. DYNEX Maintenance Log
      a. Name of the instrument
      b. Description of maintenance being performed (e.g. routine check, symptom and repair) and initials of person performing maintenance and date maintenance performed
   7. Digital Diluter Log
      a. Name and serial number of instrument
      b. Description of maintenance being performed (e.g. checking lines, calibration check, etc.) and initials of person performing maintenance and date maintenance performed
   8. Pipette/Digital Diluter Check Form
      a. Equipment Identification
      b. Temperature of Water
      c. Thermometer Identification
      d. Density of Water
      e. Target Volume and Allowable Tolerance
      f. Measurements (weights of water)
      g. Result (mean actual volume)
      h. Analyst and Date
   9. Coroner's Office Toxicology Request
a. Name of Deceased
b. Coroner's Case Number
c. Requesting Pathologist
d. The evidence submitted for analysis
e. The type of analysis being requested
f. Related Agency (required for homicides)

10. Telephone Log/Additional Notes Page
a. Laboratory number
b. Initials at the top of the page are optional
c. Date
d. Page number
e. For Telephone/Communication Log, it is suggested that the person spoken with (or communicated with) is identified

11. Toxicology GC/MS Worksheet
a. Sample type (Blood, Urine, etc.)
b. Sample volume used during analysis
c. GC/MS method used for analysis
d. Date(s) of analysis
e. Instrument number used for analysis
f. Results for each analyte evaluated to include:
   i. Standard concentration results (target and actual)
   ii. Quality Control concentration results (target and actual)
   iii. $R^2$ Value
   iv. Value of Blank
   v. Case sample concentration results
      1. note: case sample concentration results will be included on the paperwork filed with the case file, not with the paperwork filed with the batch documents

12. Toxicology Section Reagent Log
a. Date reagent was prepared
b. Name of reagent
c. Lot # of Chemical
d. Verification
e. Initials of person who prepared reagent

13. Gas Line Moisture Trap and Oxygen Filter Check Log
a. Gas line being checked (by number or location)
b. Initials and date of person checking the gas line

14. Balance Calibration Check Log
a. Instrument number and/or serial number
b. Reference standards used to check balance
c. Date and Initials of person checking balance

15. Balance Maintenance Log
a. The service needed or service performed/repair details
b. Date and Initials of person performing maintenance

16. Stock Log
   a. Analytes/Concentration
   b. Lot # of Reference Material
   c. Expiration
   d. Verification
   e. Initials/Date Prepared

17. Matrix Log
   a. Levels/Analytes/Concentration
   b. Lot # of Reference Material
   c. Matrix
   d. Expiration
   e. Verification
   f. Initial/Date Prepared

18. GC/MS Traceability
   a. Method
   b. Lot # for:
      i. Blank
      ii. Standards
      iii. Stocks
      iv. Chemicals
      v. Reagents
   c. Pipettes
   d. Analyst/Date

19. Screening Session Worksheet
   a. Diluter
   b. Immunoassay Kits used, to include:
      i. Analyte Lot #(s)
      ii. Plate Conjugate Identification
   c. Reagent Lot #(s)
   d. Standard Lot #(s)
   e. Kit Calibrator Lot#(s)
   f. Date/Analyst

20. Assignment Notification Sheet
   a. Lab #, including request #
   b. Subject Name
   c. Agency
   d. Agency Case #

21. Extraction Unsuccessful Run Log
a. Extraction Name  
b. Issue  
c. Analyst and Date

22. Screening Unsuccessful Run Log  
a. Plate/Analyte  
b. Issue  
c. Analyst and Date

23. Quality Log  
a. Issue  
b. Analyst/Date

24. Whole Blood Screening Log  
a. lot #  
b. date received  
c. screening results  
d. A/N/B results

25. Propionic Anhydride Verification  
a. lot #  
b. analyst/date  
c. morphine concentration tested  
d. 6-MAM below LOQ

26. Drug Usage Log & Drug Verification Log  
a. See *Controlled Substance Technical Unit Manual*

27. Tox Electronic Signature Form  
a. Analyst signature/date and number of pages created  
b. Reviewer signature/date and number of pages reviewed
### Policy
The following is a list of references found in the Toxicology Binder sets (printed or electronic) available to analysts. Additional references may be found in the Toxicology Binder sets, in the Muir Library and Power DMS. The list should neither be considered inclusive of all references available nor complete for drug impairment qualification. (Supplemental 5.2.7)

### A. Alcohol

Chapter 3: Enactogens

Overview of MDMA

Phenmetrazine: an Obsolete Problem Drug
Mellar, John, Lo E. Hollister

Commentary on obsolescence of drugs and particularly phenmetrazine as an anorectic drug. It is replacing amphetamines as the abused stimulant of choice.

Enhancement of Human Performance by Caffeine and the Weise, Bernard, Victor G. Laties

Extensive study on impairment and performance on caffeine and amphetamines.

END OF DOCUMENT
I. Policy: Evidence is handled in a manner to ensure its integrity and to protect it from loss, cross-transfer, contamination and deleterious change.

A. Tape Seals
   1. All evidence received at the laboratory or retrieved from evidence lock boxes shall be tape sealed with tamper proof tape. Evidence seals will be such that they are likely to yield evidence of an intrusion.
   2. The seal shall be initialed by the officer or property personnel placing the evidence in the envelope or package.
      a. If the seal was not initialed, the laboratory staff person shall apply tamper proof evidence tape across the agency seal, or use the "received without initials" (RWI) stamp and initial and date the stamp.
   3. Unsealed evidence shall be properly sealed before it is accepted for examination.
   4. Staff opening evidence is responsible for inspecting evidence in their possession to ensure the evidence packaging requirements are met.
      a. Staff opening evidence should initial the box on the lower left hand corner of the envelope indicating that the evidence received was sealed.
   5. See the Division Manual policy for more information on tape seals.

B. Chain of Custody
   1. The chain of custody for alcohol and toxicology evidence transfers is recorded on the evidence envelope when received initially and when released from the laboratory.
   2. The chain of custody within the lab will be electronically recorded at all stages using the Laboratory’s Information Management System (LIMS).
   3. The chain may also be signed on the envelope.
   4. Evidence splits shall also be documented.
   5. See the Division Manual policy on Chain of Custody for more information.

C. Opening Evidence Package
   1. Laboratory staff should open envelopes in such a way that does not disturb the integrity of the seal of the submitting agency. This may be done by cutting through the top edge or side edge of the envelope.
   2. Evidence may be opened by an aide or criminalist

D. Instructions for Re-assigning Casework
   1. It is common in the toxicology section for multiple analysts to be involved in the case. Analysis is generally assigned to the unit rather than an individual analyst.
   2. Minimally, the analyst who is closing the case for casework analysis must:
      a. re-assign the case(s) in LIMS
      b. seal, mark and verify all vials (if not the individual who opened the evidence) - see below for more information on marking evidence

E. Evidence Itemization (See QA.09 Itemizing Evidence)
   1. For all items within the same container itemization will occur when:
      a. Samples are of a different type
i. Blood, Urine, Vitreous, Cavity Fluid, etc.
ii. Coroner's blood collected from different locations (peripheral, heart, etc)

b. Samples in which the collection time is significantly different
c. Hospital vials
   i. Each color top will be itemized separately (similar top tubes may be itemized together)

2. Test results will be associated with the sample analyzed.
   a. In the event that a sample needs to be pooled with another in order to perform analysis then
      i. A new item may be created which will reflect the combination of samples OR
      ii. A note may be made in the Report Comments

F. Marking and Verification of Evidence
1. When the package is first opened, each vial or jar must be marked in an indelible manner with the following:
   a. Laboratory number
   b. Request number
   c. Laboratory submission number
   d. Initials of the person opening the evidence
   e. Date
2. When a vial or jar is used for analysis:
   a. Vials used in analysis must be labeled with a sticker (typically yellow) containing the case number, barcode, initials and date
      i. The case number, request number and submission number must be included in a barcode format that allows the use of a barcode scanner during analysis (see TOX.65 for more information on use of a comparator barcode scanner)
         1. The barcode placed on the vials will be independent of the LIMS generated barcode on the evidence envelope.
      ii. The barcode needs to be placed on a relatively flat location with minimal curvature to ensure effective scanning.
         1. Samples submitted in non-Contra Costa County Containers may have limited space for sticker placement. The sticker may be cut or reduced in size to ensure placement of the barcode.
         2. If the barcode does not fit, or cannot be placed in a position that allows for scanning, an explanation will be included in the notes.
   b. If a new vial is opened, it should also be labeled with a yellow sticker including a barcode.
   c. Each vial used for analysis must be marked with the analyst's initials and date at the time of initial contact
   d. Analysts are not required to initial and date every contact with the same vial.
      i. If a new vial is opened, it requires initials and date
      ii. If the same vial is analyzed under a different request, it requires initials and date
3. Verifying/Closing evidence: A criminalist shall verify evidence opened by an aide. This may be done after all analysis is completed.
   a. Verify that the required information listed above is present on each vial or jar
   b. The analyst will place their initials and date of verification on the vial/jar
4. For each blood or urine envelope that is submitted for the purpose of toxicology analysis an Assignment Notification Report (ASN) may be printed. This form is used to notify the unit that a sample has been submitted for analysis. This page will contain, at a minimum, laboratory number, request number, submission number, subject name, the submitting agency, and the agency case number. Due to the nature of toxicology casework, analysis is not usually assigned to a specific analyst.
a. Other LIMS generated reports with the same information are available and may also serve as notification a sample has been submitted

5. Upon opening evidence, the case information on the evidence packaging and sample container(s) shall be compared against the case information existing in LIMS. Upon completion of a request, the information on the evidence and packaging may again be compared to LIMS. The comparison may be completed with the aid of the ASN, use of LIMS generated reports, comparison to the case notes, or direct comparison in LIMS. Discrepancies shall be documented in the analysis notes or corrected by the clerical staff after verifying the correct information with the appropriate agency.

G. Events that will halt analysis and require communication with the customer prior to proceeding with testing include:

i. Samples that have insufficient sample for analysis such as short draws or broken vials

ii. Samples not conducive to testing requested such as serum separator tubes

iii. Samples that would not have sufficient amount of sample for all testing requested

H. Procedural Precautions

1. Procedural precautions must be taken to reduce the risk of evidence loss, cross-transfer, contamination and other deleterious change. Examples include the following:

   a. Using disposable pipette tips and transfer pipettes, when applicable
   b. Adequately labeling jars and vials
   c. Changing contaminated gloves
   d. Maintaining a clean work area
   e. Rinsing the dilutor tubing
   f. Disinfecting external surfaces of a pipette

I. Split Items or Items Removed from the Parent Item (Itemization)

1. Materials removed from the original item of evidence and packaged separately are considered "split evidence". The split evidence will be tracked with its own item number and chain in LIMS.

2. Splitting evidence is routinely done for expediency when evidence is requested for multiple types of analyses (alcohol and toxicology analyses) within the laboratory or when a referee or outside laboratory analysis is requested.

   a. For referee or outside laboratory analysis procedures see TOX.56 and BA.37
   b. For procedures for splitting evidence (Itemization) for alcohol and toxicology analyses see BA.08

3. See Division Manual policy FSD.38 on Evidence Itemization for more information

J. Evidence Storage

1. All evidence not in the process of examination shall be maintained in a secured, limited access storage area that is appropriate for avoiding deterioration, loss or damage to the test item.

   a. The evidence room "Muir-Refrigerator-Incoming Evidence" refrigerator is the primary storage location for evidence awaiting examination.
   b. The evidence room "Muir-Refrigerator-Incoming Evidence" refrigerator is also the primary storage location for evidence that has been forwarded from the Alcohol Unit to the Toxicology Unit for analysis.
   c. Open cases must be secured in a locked "Muir-Refrigerator-Toxicology" pending completion of analysis
   d. The evidence room is the primary storage location for evidence awaiting return to the submitting agency.

2. Each analyst in the Toxicology unit is provided with a key to the "Muir-Refrigerator-Toxicology" for storing and securing evidence.

3. Keys to the "Muir-Refrigerator-Toxicology" are limited and maintained in a locked key box by the Muir Administration or under the personal control of the Analyst(s) responsible for the case.

4. For short absences (e.g., lunch), it is not necessary to package and/or seal "in-progress" evidence being examined. The toxicology unit is a limited access location in the laboratory. The caps should be placed on containers containing biological fluids to prevent evidence loss or cross-contamination.

   a. In-progress evidence will not be left open for an "open-ended" period of time.
K. Sealing and Returning Evidence

1. Once analysis is complete, an analyst shall seal and return evidence from the laboratory to the Evidence Storeroom.
   
   a. The analyst responsible for closing the case is generally responsible for also sealing and returning the evidence. However, if the analyst is unavailable and the evidence needs to be returned, another analyst may seal and return the evidence.

2. Examined containers must be tape sealed, and then initialed and dated. Scotch tape is acceptable for this purpose.

3. The evidence envelope seal must be initialed and dated across the tape seal to identify the staff member who sealed the evidence.

4. Evidence associated with the California Vehicle Code and have had alcohol analysis shall be retained and stored in the refrigerator in the Evidence Storeroom for one year after the date of collection, in order to allow for analysis by the defendant. Charges such as 655 H&N (Boating DUI), 192 PC (Vehicular Manslaughter), 215 PC (Carjacking), Accident, and Traffic will be evaluated on a case by case basis and may also be retained for one year. See BA.08 for more details.

5. All other evidence will be returned after analysis to the submitting agency. The evidence from the Sheriff's Office and Contra Costa County Contract Cities will be forwarded to Sheriff's Property and Evidence Services.

L. Evidence Release

1. A Division staff person must sign the chain of custody on the package when evidence is released from the Forensic Services Division.
   
   a. The release or disposition of a sample is recorded under chain of custody in the laboratory case file in the LIMS system.

2. An evidence receipt must be signed when the evidence is released from the Forensic Services Division.

3. Please refer to the Division Manual for required documentation on release of evidence for referee analysis or outside laboratory analysis (OLA).

END OF DOCUMENT
I. Policy: The following guidelines for the preparation of examination records must be followed in all cases. Failure to do so will result in the report and examination records being returned to the analyst for correction.

These guidelines represent the most common note taking requirements. See the Division Manual policy for more information.

A. The case record is considered files containing administrative and examination documentation generated or received by a laboratory pertaining to a particular case. For more information about Case Records refer to the Division Policy. The case record consists of:

1. The report and case notes or examination documentation, defined as the case file.

2. Any administrative records will be uniquely identified by the laboratory number and may include:
   a. Communications (phone or e-mail communication)
   b. Declaration of blood withdrawal
   c. Coroner's Request Forms
   d. District Attorney's Request Forms
   e. Police report
   f. Discovery requests or referee analysis requests

3. The electronic chain of custody. The official chain of custody is maintained in the Laboratory Information Management System (LIMS).
   a. The chain of custody at the time the case is submitted for review may be included in the case file.

4. A reference to the Lot # of solutions (reagents, stock solutions, internal standards, matrix standards) will be included in the "batch" or "run" documents.
   a. More information about the Lot # may be found in the respective logs

5. A reference to the equipment used in the case will be included in the case notes or the "batch" or "run" documents, filed separately
   a. Maintenance records of equipment used is maintained in their respective maintenance logs
   b. The GC/MS used is indicated on the GC/MS worksheet in the case notes.
   c. Additional equipment, such as pipettes and dilutors, is recorded in the batch records.

6. The only methods used for quantitative analysis are those which have been validated and approved for use.
   a. The operating parameters for these methods may be located in the Validation Binders. Any deviations from the operating parameters will be documented.

7. The following "batch" or "run" documents are generated and reviewed for each screening session.
   a. Session Traceability Worksheet
   b. Plate Reports
   c. Barcode Scanner Report

8. The following "batch" or "run" documents are generated and reviewed for each extraction.
   a. GCMS Worksheet (summary of results of standards and QCs)
b. Traceability Worksheet  
c. LIMS Generated Worklist  
d. Instrument Autotune  
e. Instrument Maintenance Log (since last cleaning)  
f. Instrument Sequence  
g. Chromatograms of all standards and QCs (including test shot)  
h. Calibration Curves (for quantitative methods)  
i. Method Control/Instrument/Tune Parameters  
j. Barcode Scanner Report  
k. GC Sequence Checklist

9. Sequence "batch" or "run" documents are entered as requests in LIMS. These "run" requests will follow the normal LIMS signature pattern at each milestone to show review of data.
   a. See BA.10 "Technical Records" for the general procedure.
   b. Note the following differences:
      i. The service type used will be "Tox Screening Data" or "Tox Confirmation Data".
      ii. The lab number will correspond to the year, the quarter, and the run type (e.g. "2019 Q1 Tox Scr" or "2019 Q1 Tox Con").
      iii. The analyst will enter the Session # or Extraction # in the data extension form.

10. Communication on Business Record or Official Record for court is maintained electronically under case activities in the Laboratory Information Management System (LIMS).

B. Examination Records

1. Examination records (notes) and observations, data and calculations shall be recorded at or near the time they are made and shall be identifiable to the specific task.

2. Examination records shall be of a permanent nature in ink or computer generated. Batch documents, instrument records and logs may be maintained in print or electronic format. If corrections are made to printed records, the procedure for making handwritten corrections will be followed (see below).

3. The case notes and records shall be sufficiently detailed to include the test conditions and shall include the identity of the personnel responsible for performance of each test and technical review of results.
   a. The individual responsible for Technical Review will be documented both on the Batch Record and the signature on the Report

4. The records must be sufficiently detailed that in the absence of the analyst, another competent analyst or supervisor could evaluate what was done and interpret the data and would know the basis of the conclusions.
   a. The date(s) of analysis will appear in the report.

5. The following information for each submission should be entered into the case notes:
   a. Description of sample (including number of vials and matrix)
   b. Note about volume of sample, if less than approximately 5 milliliters for blood vials
   c. Condition of sample (sealed or unsealed)
   d. Kit number of the sample(s)/submission
   e. Notation about drugs requested on the envelope
   f. The total number of containers must be added to "number of containers" box. This information will appear on the report
   g. Use of smaller sample volumes

6. Any remarks or discrepancies will be recorded in the examination records and on the final Report of Laboratory Examination.
   a. The following conditions should be noted, these include but are not limited to
i. Any non-compliant conditions
ii. Broken Sample Container
iii. Insufficient sample for analysis
iv. Sample consumed during analysis
v. Sample not in a container provided by the laboratory (Non CCCSO Container).

7. Only the approved procedures for analysis in the Toxicology Technical Unit Manual will be used. Any discrepancies will be noted as indicated above.

8. Case notes will be single-sided on a page

9. For more information about retention of case records refer to the Division Manual.

10. In the toxicology unit, the analyst that prepares the report may not be the same as the analyst who tested the items. The individual analysts will ensure that their initials, either handwritten or secure electronic equivalent, are present on the relevant images or notes.

11. If an individual, other than the analyst on the report, interprets the findings including testifying concerning the documentation (eg. Business Record or Official Record), that individual will document the review of the examination documentation. Entering an activity in LIMS is documentation of the review:
   a. For cases that are associated with lab number, the business record or official record activity should be related to the request.
   b. For non-case related activity, click on the "activity button"
   c. The documentation should include that:
      i. the report and notes were reviewed
      ii. the purpose (eg. business/official record)
      iii. the reason for the review (eg. analyst retired, in training, on vacation, sick, etc.)
   d. LIMS Instructions:
      i. Under the request tab, select the request
      ii. Right click and select "activity"
      iii. Click the green "+" button
      iv. Choose the appropriate activity (court prep or court testimony)
      v. Add the time spent and the notes should document the review of the report and notes as well as the purpose and why a business or official record was done

12. Page Identification
   a. All note pages shall have the laboratory number, handwritten or computer generated initials of the examiner and the page number on the upper right hand corner of the page.
   b. The first and last page shall have the total number of pages.

13. Corrections:
   a. Technical/Administrative Review Corrections:
      i. Technical review corrections: All corrections will be recorded in LIMS in the request, in the "Notes: Reviewer" field
         1. Identify correction(s) and include the reason for the correction
         2. Record the date and technical reviewer's initials
         3. The analyst enter what correction was made and when the correction was completed with their initials and date.
      ii. Administrative review corrections: All corrections will be recorded in LIMS in the request, in the "Notes: Reviewer" field
         1. Identify corrections
         2. Record the date and administrative reviewer's initials
3. It is recommended that the analyst enter when the correction was completed with their initials and date.

b. An electronic audit trail is maintained to view changes made electronically after a case has been draft complete.

14. Disposition of Evidence

a. Routine evidence disposition is included on the report annex. Evidence associated with California Vehicle Codes (CVC) and tested for Alcohol will be kept for one year in the laboratory, then returned to the agency. All other evidence will be returned to the agency, unless otherwise noted on the report.

i. Charges such as 655 H&N (Boating DUI), 192 PC (Vehicular Manslaughter), 215 PC (Carjacking), Accident, and Traffic will be evaluated on a case by case basis. The disposition will be noted on the report as a report comment if not returned to the agency.

15. Generating Worklists

a. The analyst will generate a worklist (a list of cases to be analyzed) within LIMS. A worklist contains the following information:

i. laboratory number

ii. subject's name

iii. sample type

b. LIMS has an analytical module for Toxicology to create Confirmation Worklists. This will restrict the cases that can be added to the worklist to a specific screening analyte.

i. LIMS menu: Analysis >Toxicology> Create confirmation worklist

ii. Choose the assigned analyst (for example: Unit, Toxicology), screening analyte, and matrix (if desired)

1. The confirmation checkbox of the screening analyte must be checked (regardless of whether it is marked as positive or negative) to appear on the list.

2. Only one matrix type can be selected. If multiple matrix types are going on the list (such as blood and Coroner-blood), leave blank.

iii. Select the cases and create the worklist

iv. For extractions that have multiple related analytes (Amphetamine screen and Methamphetamine Screen have the same confirmation extraction; Cocaine screen and Opiate screen have the same urine confirmation extraction), multiple worklists will have to be created to capture all of the cases to be confirmed.

c. The LIMS created worklist is used to create the GC Sequence Checklist though a LIMS crystal report.

i. The GC Sequence Checklist will be used to ensure that vials are placed in the correct positions on the autosampler.

END OF DOCUMENT
I. Policy: Reports will be written in accordance with the following guidelines.

A. Report Writing
   1. Reports are to be prepared by the analyst at or near the time of completion of the analysis.
   2. The results of each test or series of tests carried out by the laboratory shall be reported accurately, clearly, unambiguously and objectively, and in accordance with any specific instructions in the test methods. The results shall include all the information requested by the customer and necessary for their interpretation of the test results and all information required by the method used.
   3. The results will be reported in a laboratory report of examination and include the information required by the customer necessary for their interpretation of the test result (the results of analysis) as well as the method used (analytical techniques).
      a. If the request for analysis is cancelled by the requestor, the Laboratory will issue a report indicating no work was performed.
   4. Reports will include information, unless otherwise indicated:
      a. Title of report or "Report of Laboratory Examination"
      b. Identity and location (address) of the testing laboratory
      c. Unique case identifier (laboratory number) and clear identification of the end of the report
      d. Name of the customer (submitting agency) the address of the customer is in the report annex
         i. The address of the contracted agencies in Contra Costa County will be maintained by the Laboratory.
         ii. An effort will be made to obtain addresses for agencies that do not routinely use the services of the Drug, Alcohol, and Toxicology Section.
      e. Method(s) used or analytical techniques employed is in the report annex.
      f. Description of, condition of and unambiguous identification of submitted evidence. This is the contents of the envelope. The tape-sealed condition of the outer packaging is also included.
      g. The date of request is included on the report. The date of receipt of evidence is in the report annex.
      h. The date(s) of the examination will be included on the report. The analyst will enter the examination date(s), a date range if applicable, in the LIMS in extended data field of the request.
      i. The reference to the sampling plan is in the report annex.
      j. Results of analysis including units of measurement.
      k. Routine evidence disposition will be included in the report annex. Evidence associated with the California Vehicle Code (CVC) and tested for Alcohol will be kept for one year in the laboratory, then returned to the agency. All other evidence will be returned to the agency unless otherwise noted on the report.
         i. Charges such as 655 H&N (Boating DUI), 192 PC (Vehicular Manslaughter), 215 PC (Carjacking), Accident, and Traffic will be evaluated on a case by case basis. The disposition will be noted on the report as a report comment if not returned to the agency.
      l. Identity and signature (or electronic equivalent), for the Toxicology Unit reports, the "approved by" signature refers to the individual who technically and administratively reviewed the case
      m. Sampling information is in the report annex.
5. In addition, reports shall, where necessary for the interpretation of test results, include the following, unless otherwise indicated:
   a. Any deviations in analytical techniques, will be included in the case notes.
   b. Uncertainty of reported toxicology quantitative analysis, which is included in the report annex.
   c. Results of toxicology analysis are conclusions.
   d. Additional information required by customer if necessary (eg. information contained on the request)

6. In addition, test reports containing the results of sampling, will include the following when necessary for the customer's interpretation of test results, unless otherwise indicated:
   a. The date of sampling will be in the case notes. The date(s) of analysis performed will be on the report.
   b. Unambiguous identification of the item (contents of the envelope)
   c. Location of sampling or analysis is the crime laboratory, which is included on the report annex.
   d. The sampling procedure is in the Toxicology Technical Unit Manual.
   e. There are no environmental conditions that would affect sampling, thus this is not applicable.
   f. Any significant deviations from the casework protocol or sample selection plan in the SOP will be authorized by the Supervisor or Manager and be noted in the case notes

7. In addition, test reports will contain the following:
   a. Date of report (Draft Complete date in LIMS)
   b. If no definitive conclusions can be reached, the reason will be documented
      i. For screening results that are reported as Indeterminate, the report will reflect that analysis indicates the sample response is below the administrative cut-off. If no confirmation is done, and further work may be performed.
      ii. For confirmatory analysis that is reported as Inconclusive, the reason will be indicated on the report, for example: sample matrix interference.
   c. If the sample was consumed during analysis.
   d. A statement to indicate when an item was not tested.

8. Laboratory personnel, other than the analyst on the report, who issue findings, interpret results, or provides testimony based on examination results will document the review of examination documents in LIMS.
   a. See Technical Records for a more detailed instruction.

9. For more information on the release of case report information refer to the Division Manual.

10. The electronic release of reports will be done through the Automated Regional Information Exchange System (ARIES) and in accordance with the Division Policy.

11. The format of reports will be in conformance with the Division Manual policy.

12. Amendments to reports will be in conformance with the Division Manual policy.

B. Expression of analytical results.

1. Quantitative results are expressed in appropriate concentration units.
2. Qualitative results are expressed as positive or negative.
3. For quantitative results, the analytical result with associated uncertainty will be reported on the report.
4. Blood or urine samples below the reporting limit will be reported as "NOT DETECTED".
5. For results that are above the linear range, the sample will be reported as "greater than" or "above" the upper limit of the linear range or limit of quantitation.
6. Where blood or urine samples are received not in compliance with prescribed collection, withdrawal, handling or preservation procedures the results are reported together with an explanation of any non-compliant condition.
   a. Any remarks will be recorded in the Laboratory Examination Notes and on the final Report of Laboratory Examination. These remarks will include, but are not limited to, any non-compliant conditions (e.g., Broken Sample Container, Non CCCSO Container…).
7. LIMS will create a final Report of Laboratory Examination of the analysis. The following information will be maintained with the report as part of the case record for each case:
   a. Laboratory Examination Notes
   b. Immunoassay data
   c. GC/MS data
   d. Image of the chain of custody which reflects the evidence transactions that are **not secure** in LIMS; typically found on the evidence envelope
   e. Any communication with requesting agency, if applicable

END OF DOCUMENT
I. Policy: The following is the procedure for adding electronic images. Toxicology analysis often involves multiple analysts. The analyst preparing the final report may not be the only individual entering images and notes. These Instructions are intended to be a guide for usage and slight variations may be made for file names, names of folders, etc.

A. Instructions for adding single images to the case file:

1. Printouts from instrument software can be converted to electronic images for use in case notes by printing through an application such as JusticeTrax Imaging.
   a. When printing from an application, the printer should be set to JusticeTrax Imaging and Printer Properties set for the desired image.
   b. The following settings are adequate for imaging of the majority of text documents with JusticeTrax Imaging, however settings may be changed to meet the needs of the user and image (ie. colors, pictures, storage locations).
      i. Device Settings - select "Portrait" and "Low Resolution 200 x 200 DPI"
      ii. File Formats - select "TIFF Packed", "1 bit"
      iii. File Formats - each page saved as separate file ("Create Multipage Image" should be unchecked or "Save each page as a separate file" should be checked)
      iv. Filename Generation - "C:\Temp". Temp folders on most instrument computers will be accessible from LIMS computers.
      v. File format is dictated by LIMS requirements, settings such as resolution and color depth should be used to minimize file sizes.

2. In general, images from the GC/MS and Dynex are added into JusticeTrax using a program called JusticeTrax Indexer.
   a. The person performing the data analysis and putting the images into JusticeTrax should be logged into JusticeTrax Indexer.
   b. If the person performing the data analysis is different from the person closing the case, the analyt's initials, or secure electronic equivalent, must appear on the images.
      i. The person performing the data analysis must be logged into the indexer.
      ii. The annotation can be anywhere on the page, but the font size should be large enough to be visible.
      iii. The indexer will automatically add annotations with the username on each image. The laboratory considers this an secure electronic equivalent.
   c. Each page must be a separate image.
   d. If indexer is open when printing from JusticeTrax Imaging, the image may automatically appear in the application.
   e. Alternatively, select File > Load File from Disk and navigate to a saved image.
   f. Type the laboratory number into the Locate field to search for requests associated with that laboratory number.
   g. Select the appropriate request and then enter the image number into the Enter Image Name field.
      i. Specific prefixes are used to order images; within a prefix, images are ordered by number (eg CON01, CON02).
ii. The prefix NMS will make images appear with the report instead of notes.

iii. The prefix SCR should be used for screening images.

iv. The prefix CON should be used for confirmation images.

v. In the notes, images will appear in the following order: ENV, COR, IMG, SCR, CON, (any other name).

h. Hit the Save button.

i. Analysis images in the notes should be ordered by date, this may require renaming images in LIMS.

   i. Renaming an image will not alter the secure username attached to the image.

   ii. Anyone can add images, however once in LIMS images may be renamed or edited by either the person who entered the image or the person assigned to the case.

3. Images that do not require initials can be added to a case through LIMS.

   a. Images must have been saved in an appropriate format and accessible from the computer being used.

   b. The case is accessed in LIMS.

   c. The LIMS-Imaging module can be accessed from the image button. This can be seen in case view or edit findings.

   d. Select the desired request and add images (Image > Insert New Image).

   e. In the dialog box that opens, navigate to the saved images.

   f. Select the image to be added. If the Image >”Allow multiple images on Add” is activated, multiple images can be added at once.

   g. An image name can be entered. LIMS automatically adds the date/time and iterates the images.

   h. Rename the images as needed.

B. Instructions for adding multiple images to the case file:

1. JusticeTrax Batch Imaging can upload multiple images to LIMS using a Directory (text files within a folder for each image) or a Batch File (a single text file that lists all images)

2. Load from Directory

   a. When printing through JusticeTrax Imaging, the “extract text to file” feature must be selected

   b. Each image must have an associated text file, all text files for the batch must have similar formatting

   c. Within Batch Imager – Application Settings, the location of the case number and request number must be set prior to loading images

   i. The BA value will be 0 (Imager will not look for a BA value)

   ii. For the Case and Request, a search string is entered with the number of occurrence in the file (1) and the start position and the length (number of characters)

   iii. Changes in the formatting of a report may require changing the Batch application settings

3. Batch File

   a. A Batch file is a text file that contains the case number, request number and the file name for the image

   b. The batch file may be created by a macro or a database

   c. On startup, select the text file that contains the batch image list

   d. All images listed in the batch file must be present

   e. To create the images, JusticeTrax Imaging may require different settings depending on the method of batch imaging

   i. Chemstation Quant reports

      1. The export quant macro will also create a batch text file to be used for batch imaging “imagebatch.txt” in the Temp folder.
2. JusticeTrax should be set with the desired settings prior to printing. The main difference from normal printing is the use of ini file. The names of the samples must be in case format (ie 12-1234-2) without any characters other than a space immediately after the request number (ie use “12-1234-2 s2”, not: “12-1234-2, s2”)

ii. GCMS worksheets (from database)
   1. If you create a batch text file for the case results “worksheetBatch.txt”, then you can use batch indexer for the GCMS worksheets.
   2. The text file created by Access assumes that the images are printed to “C:\temp” and named “GCMS Worksheet w Case Results000001.tif” (printer settings of “Use the document name” should produce this).

f. Open the Batch Indexer. Select the desired source for images when asked. Batch Indexer will load the images and case numbers.
   i. Annotation should be in an area where it is unlikely to overwrite text in the image (ie, bottom left).
   ii. Uncheck the “Send BA val to LIMS” box
   iii. Verify that the images correspond to the correct case and request numbers
   iv. If secure electronic initials are required, the user must login before images are sent to LIMS
   v. The Send box should be checked for each image along with the “Sample Data” box. The “Control Data” box should be unchecked
   vi. To send the images to LIMS, click the “submit to LIMS” button
   vii. The Indexer will send the images to the specified request, naming each image based on the date submitted. (If an instrument has been selected, it will be placed in a folder with the instrument name).
   viii. For correct order in the lab notes, the images should be renamed per toxicology unit convention (ie con01, con02). The images will appear in the notes in the named order, regardless of folders.

C. The following is the procedure for creating electronic “batch” or “run” documents:
   1. Batch Records may be stored electronically in a format such as PDF
   2. PDF files can be created by JusticeTrax Imaging or other programs such as PDFcreator
   3. Pages for the batch record may be created separately and then combined into a single PDF file with an electronic signature page
   4. JusticeTrax Imaging
      a. The JusticeTrax imaging can print PDFs, but generally works best for widely used software, such as Word and Access. Documents from other applications may not print as expected.
      b. Set the file type to PDF or “PDF image”
         i. “PDF images” will not be searchable PDFs, but may generate images as desired for the less common software applications
      c. The file name and location can be set to the folder desired.
   5. PDF creator
      a. If PDF creator has been installed there will be an application in the Windows Program menu in addition to the printer in the Windows Printers and Faxes.
      b. The application is where default settings can be selected.
         i. The type of file should be PDF and the desired output folder can be set as C:\temp.
         ii. AutoSave will automatically save each file printed to the desired folder.
      c. If AutoSave is not selected, the user will have the option to change filenames and locations prior to saving. A dialog box will appear with each printing to allow the user to select how to proceed.
         i. The user can enter the filename and save location
         ii. Using the “Wait-collect” feature allows multiple files to collect into the queue
            1. Previously saved files can also be added (Document menu – “Add”)
iii. Once all the desired files have been printed to the queue, they can be combined into one file (Document menu – “Combine”).
iv. Files can be reordered prior to combining by using the arrow buttons.
v. When ready to save the final file, click the print button. Enter the name and location and then select save. A PDF file will be created.

6. PDF file for secure electronic signatures
   a. Saving a file with the signature form requires use of Adobe Acrobat Pro (or similar)
      i. Variations may occur between different versions of Adobe. There are multiple ways to perform the same actions. See Adobe help for more information if needed.
   b. Open Adobe Pro, Select “Combine file into PDF” from the task list.
   c. Add the desired files in the dialog box that opens. The files can be organized into the desired order. Click “Combine Files”
   d. A pdf document will open with all of the individual files combined.
   e. Individual pages can moved/rotated/deleted.
      i. Show page thumbnails.
      ii. To move an image, select and then drag to the desired position
      iii. To rotate an image, select and the click on the rotate button. This is how the image will be viewed by default after it is saved.
   f. Once the document is formatted as desired, select “Save as Other – Reader Extended PDF – Enable More Tools (includes form fill-in & save)”
   g. Name the file and save in the desired location
   h. The file is now ready to be signed

7. Signing PDF file
   a. A properly created PDF file can be signed in Adobe Acrobat Pro or Reader. Signatures and signature appearances should be created per SOP. Signatures and appearance must be created for each different computer and software (Pro/Reader) used. The computer must have access to the network folder containing signature identities in order to validate the signature.
   b. Open the file to be signed
   c. Add the total number of pages created (for the first signature). Add any comments needed.
   d. Click on the signature box, the “Sign Document” dialog box will open.
   e. Select the desired signature and appearance and enter the password.
   f. Save the document.
   g. Document should be saved to a designated location. The file can be linked to the record in the database for ease of retrieving.

END OF DOCUMENT
I. Policy: Reference Materials will be verified, labeled and stored in a manner to ensure the integrity of the standard.

A. Reference Materials

1. Reference Material (RM): A material, sufficiently homogeneous and stable with respect to one or more specified properties (properties can be quantitative or qualitative), which has been established to be fit for its intended use in a measurement process. A reference material is a substance of known concentration and/or composition from a known source. These are defined as follows:

   a. Certified Reference Material (CRM): A reference material characterized by a metrologically valid procedure for one or more specified properties, accompanied by a certificate that provides the value of the specified property, its associated uncertainty, and statement of metrological traceability

      i. Some material sold as CRMs have no stated evidence of traceability

   b. NIST-Traceable Reference Material™ (NTRM™): A commercially-produced reference material with a well-defined traceability linkage to existing NIST standards for chemical measurements established via criteria and protocols defined by NIST.

      i. A NIST NTRM may be recognized by a regulatory authority as being equivalent to a CRM

2. Laboratory-generated solutions

   a. The stock and matrix solutions used for quantitation of drugs in samples are considered to be a reference material. The standards used to establish the concentration curve will be traceable to NIST (NIST Reference Material) or a CRM, where possible. The documentation of traceability will be maintained by the Toxicology Unit.

B. Ordering and Receiving

1. All reference materials will be ordered at the request of the unit. The reference standards will meet the criteria of the method in which they are used.

2. When reference materials are received they will be checked with the order and packing slip to verify order prior to use.

C. Storage, Handling and Use

1. All reference materials will be stored, handled and used in a manner that prevents contamination, deterioration and protects their integrity. This includes:

   a. Storing reference materials according to the vendor instructions on the reference material label or certificate.

      i. Ampules, or sealed glass containers with solution, are stored refrigerated or frozen.

      ii. Reference materials, or stock solutions and matrix solutions, are stored frozen or refrigerated within the laboratory.

         1. See respective procedures for more information about storage.

      iii. Drug Standards, controlled, non-controlled and prescription, are located in the Drug Unit or Chemical Store Room. Drug Standards should not be stored at an analyst's workbench for an extended period.

         1. If it is necessary to keep a standard for an extended period of time, including overnight, then the manager or supervisor should be notified, about the standard being kept at the workbench along with the assigned drug inventory tracking number.
2. Amounts of drugs consumed should be documented on a Drug Usage Log. See *Controlled Substance Unit Manual* for more information regarding documenting usage.

b. **Handling** the reference material with care when removing it from its storage location and returning it to its designated location.

   i. Movement of reference materials within the laboratory is not considered transport.

c. **Using** the reference material utilizing good lab practices to prevent against contamination and to protect the integrity of the reference material. This may include:

   i. Ensuring proper labeling.

      1. Purchased reference materials are labeled with all relevant information, including concentration and expiration date. See *Lab Generated Solutions* for information.

      ii. Using a calibrated pipette, draw the appropriate amount of the reference material and dilute with the requisite solvent indicated in the specific procedure.

      iii. Abiding by any expiration dates on the reference material label or certificate, and not using the reference material or any solution made from that reference material past the expiration date.

         1. This includes ensuring the expiration date on the reference material label or certificate is transferred to any secondary bottle or solution made from that reference material. Or, if there is a laboratory assigned expiration date that is before the expiration date of the reference material, the laboratory assigned expiration date will be transferred to any secondary bottle or solution made from that reference material.

     iv. Following any safety warnings on the reference material label or certificate.

D. **Verification**

   1. Purchased reference materials are verified. Examples of verification include:

      a. Instrumental analysis such as FTIR or GC/MS analysis and comparison to a published spectrum. Some examples of publication include but are not limited to:

         i. CND Analytical Profiles

         ii. Instrumental Data for Drug Analysis, T. Mills & J. Roberson

         iv. Peer reviewed published articles

      b. NIST or NIST-traceable standard

      c. Analysis and comparison to an existing verified standard

      d. A document form the vendor certifying the standard (certificate of analysis)

      e. Other recognized standard from a known source

2. Documentation of verification will be maintained. These records may include:

   a. Certificates of Analysis (COA) maintained either electronically or hard-copy

   b. A Drug Verification Log. See *Controlled Substance Unit Manual* for more information regarding documenting verification.

3. Laboratory Generated Solutions are verified by successful use in analysis

   a. See Laboratory Generated Solutions for further information

4. **Source of Reference Materials**

   a. Reference material used in preparation of matrix standards and QCs are purchased as ampules - a solution of a drug in solvent contained within a sealed glass container

      i. Where possible, standards should be a Certified Reference Material purchased from a vendor who in accredited to ISO 17025 and Guide 34.

         1. If the vendor is ISO 17025 and Guide 34, the vendor's accreditation certificate and scope will be checked yearly.

         2. Where possible, standards and QCs should be prepared from different vendors, this is used as a check of the identity and concentration of the materials.
3. If an alternate vendor is not available, a different lot from the same source can be used.
4. For a Resolution Solution (RS), powdered drug standards may be used.

E. Reference Standards (Balance Check Weights)

1. See the policy on *Balances* for the program and procedure for calibration of check weights.

END OF DOCUMENT
I. Policy: Many types of solutions are prepared by lab staff for use in analysis. This includes reagents, stock solutions and matrix solutions. Effectiveness of solutions will be verified.

A. The appropriate log must be filled in with the appropriate information.
   1. Logs may be divided based on the type of solutions - Reagent, Stock, and Matrix
   2. Instructions for the preparation of stock and matrix solutions can be found in the respective method.
   3. A list of commonly used reagents and recipes can be found in the Reagent Preparation procedure.
   4. Elution Solutions are made the same day they are used and are not logged separately from the extraction. Information regarding the chemicals used are recorded in the Extraction Traceability section of the Tox Database.
   5. Working solutions are not logged separately. Information regarding working solutions for matrix solutions may be included in the matrix standard section of the Tox Database. For IS working solutions, the pipette used is included in the Extraction Traceability form.

B. Flexibility of recipes and instructions
   1. Recipes and instructions are provided for a single volume.
   2. The final volume for any solution can be adjusted to meet the needs of analysis. Any deviation from the published concentrations or final volumes must be approved by the Supervisor/Manager prior to adjustment.
      a. Reagent recipes must be adjusted proportionally
      b. Stock/working/matrix solutions can be adjusted for volume and/or concentration. Solution containers must be labeled clearly with the concentration so that analysts can correctly calculate amounts needed for any subsequent solutions
      c. For matrix solutions, each extraction procedure has suggested concentrations for standards and quality controls based on method validation. It is at the discretion of the analyst which concentrations will be used as long as they fall within the validated linear range of the method (unless otherwise stated in the extraction procedure). Any deviation from the published concentrations or final volumes must be approved by the Supervisor/Manager prior to adjustment.
         i. However, if there is an indication that a sample is positive within the validated linear range and it cannot be reported due to the concentrations made at the discretion of the analyst (eg. elevated LOQ) the sample should be re-run with a lower LOQ or a notation should be included on the report indicating further work may be performed.
   3. Multi-analyte solutions can be made in combinations of analytes that are necessary for analysis.
   4. Screening and extraction procedures indicate concentrations and volumes of solutions to be prepared; deviations from these volumes and concentrations are acceptable and will be approved by the Supervisor/Manager then documented. This can be accomplished by including information such as final volumes, starting concentrations, ending concentrations and flask size in the matrix standard logs.
   5. For blood matrix solutions, preservative and anti-coagulant should be incorporated into the final solution. This may be accomplished by using blood containing a preservative and anticoagulant (eg. from a blood bank) or adding the preservative and anti-coagulant to the solution. The concentration of preservative and anti-coagulant in the matrix solution should be similar to concentrations specified in a gray-top Vacutainer vial.
   6. For urine matrix solutions, preservative should be incorporated into the final solution. This may be accomplished by adding preservative to the urine. The concentration of preservative in the urine should be similar to concentrations specified in the urine jars.
C. Verification:
   1. Solutions are verified and the check is documented in the respective logs.
      a. Logs will indicate who prepared the reagent and who verified the reagent
   2. Buffer solutions should be tested for pH before use in casework
      a. This can be done by pH paper or use of a pH meter
      b. The method of testing may be documented
   3. Solutions that do not have independent methods available for verification are verified by successful use in an extraction
      a. The method of testing will be documented (ie GCMS)
      b. The use of an extraction number (GCMS) or plate number (Dynex) can be used to identify the method
   4. There may be multiple steps between a solution and verification (e.g. A stock solution is used to make a matrix solution which is then used in an extraction. The successful use of the matrix solution in an extraction can serve as verification of both the stock and the matrix solution).

D. Traceability
   1. The standards used to establish the concentration curves will be traceable to NIST reference material or a Certified Reference Material (CRM), where possible.
   2. The pipettes and volumetric glassware will be calibrated by vendor accredited to meet ISO 17025 by an ILAC signatory requirements with the requisite scope of work. see FSD.30.
   3. The documentation of traceability will be maintained by the Toxicology unit

E. Labeling
   1. Reagents will be labeled, at minimum, with:
      a. The identity of the reagent
      b. The date of preparation and/or lot number
      c. Hazard label, if appropriate. See SAF.11
      d. Chemicals will be stored in accordance with SAF.12 and manufacturing labeling recommendations
      e. Reagents are stored in a fume hood
      f. All reagents are stored at room temperature unless labeled otherwise
   2. All other solutions will be labeled, at minimum, with:
      a. The identity of the solution, including:
         i. Concentration and/or level
         ii. Analytes present
            iii. Due to limitations in the size of containers and labels, the list of analytes present may be indicated using a descriptive name based on its intended use (ie 4-panel in place of METH/BE/MOR/OXA or opi blood in place of HYD/COD/OXY/HYM/OXM/MOR)
      b. The date of preparation and/or lot number
      c. Expiration date if present

F. Expiration Dates
   1. Reagents prepared from a source, or chemical, with an expiration date must carry that expiration date to the label on the reagent. If the source material used for the preparation of the reagent does not have an expiration date then the reagent will not have an expiration date. The reliability of reagents is continually checked with each extraction.
   2. The expiration date for solutions prepared from reference materials are based on the expiration date of the original reference material (e.g. ampule) or may be specified by the procedure.
      a. The expiration date on a solution should not be later than the earliest expiration date of any individual component.
b. Procedures may specify or indicate earlier expiration dates (earlier than the date provided by the reference material provider) from validation data.

3. If the reference material provider does not provide an expiration date, subsequent solutions prepared from that reference material may not have an expiration date.

4. If no specific expiration date is present and only a month is provided, the last day of the month will serve as the expiration date (e.g., if an ampule reports an expiration date of 01/2016, the expiration date of the ampule is 01/31/2016).

END OF DOCUMENT
I. Policy: Reagents will be prepared in accordance with recipes in the extraction methods and/or reagents binder.

A. Reagent Recipes
   1. Refer to the Reagent Recipe list below for reagent recipes and hazard information.
   2. Recipes may be adjusted proportionally to produce the desired final volume.
   3. Reagents may be stored with appropriate chemicals (ie acids, bases, flammable) based on the properties of the reagent, or in a storage location for Extraction Reagents.
   4. Most reagents made in large quantities will have a primary and secondary container, which may not be stored in the same place. (The smaller secondary containers are typically stored with extraction reagents)

B. Reagents will be checked to ensure their reliability
   1. See Lab Generated Solutions for more information about checking reagents as well as expiration dates for reagents.

**Reagent Recipes**

**0.1 M sodium acetate (NaOAC) buffer pH 6.0**
13.6 g sodium acetate in 1 L water, add 6-10 drops glacial acetic acid

**5% zinc sulfate (ZnSO₄) in 50% methanol**
50 g zinc sulfate hydrate in 500 ml methanol and 500 ml water

**0.01M acetic acid (CH₃COOH)**
57 µl conc. acetic acid in 100 ml water
0.1 M acetate buffer pH 4.0
2.85 ml glacial acetic acid and 8.0 ml 1.0 M potassium hydroxide in 500 ml water

1.0 M potassium hydroxide (KOH)
5.611 g KOH, add water to a volume of 100 mL

10 N sodium hydroxide (NaOH)
40 g sodium hydroxide in 100 ml water

0.1 M hydrochloric acid (HCl) in water
4.2 ml conc. hydrochloric acid in 500 ml water

10:1 glacial acetic acid/conc. hydrochloric acid
10 ml conc. hydrochloric acid in 100 ml flask, QS with acetic acid

1% hydrochloric acid (HCl) in methanol
1 ml conc. hydrochloric acid, dilute to 100 ml with methanol

1.0 N sulfuric acid (H$_2$SO$_4$)
13.88 ml conc. sulfuric acid, dilute to 500 ml with water
2 M sodium acetate (NaOAC) buffer pH 4.5
27.2 g sodium acetate in 75 ml water, adjust pH with acetic acid, add water to volume of 100 ml

0.1 N sulfuric acid (H₂SO₄) (cold)
10 ml 1.0 N sulfuric acid, dilute to 100 ml with water

2.0 M TRIS buffer, pH 8.1
60.5 g TRIS base in 250 ml volumetric, dissolve with 150 ml water; add 1 ml conc. hydrochloric acid, adjust pH with HCl, QS with water

10 M potassium hydroxide (KOH) saturated with potassium bicarbonate (KHCO₃)
* add 150 ml DI water to 250 volumetric, add 140 g KOH, dissolve with 200 ml water, add powered KHCO₃ (stirring) until no more will go into solution

70 µg/ml phentermine
43.5 mg phentermine in 500 ml DI water

1.0 M acetic acid (HC₂H₃O₂)
5.75 ml acetic acid in 100 ml water

0.1 M sodium acetate (NaOAC) buffer pH 4.5
2.93 g sodium acetate in 400 ml water; add 1.62 ml acetic acid (adjust if needed with additional acetic acid), add water to volume of 500 ml
2.0 N Nitric Acid (HNO\(_3\))
6.25 ml conc HNO\(_3\), add water to volume of 500 ml

2 N sodium hydroxide (NaOH)
80 g NaOH, add water to a volume of 1 L

5% NH\(_4\)OH
5 ml conc. NH\(_4\)OH, add DI water to 100 mL

0.1 M potassium phosphate (KH\(_2\)PO\(_4\)) buffer pH 6.0
13.6 g potassium phosphate in 1 L water, adjust with 1M KOH to pH 6.0

0.2 M potassium bicarbonate (KHCO\(_3\))/ 0.07 M potassium carbonate (K\(_2\)CO\(_3\)) pH 9.0
20.0 g potassium bicarbonate and 10.0 g potassium carbonate in 1 L water, adjust with HCl or KOH to pH 9.0

* Strong Alkaline solutions should not be stored in PET (polyethylene terephthalate) or PC (polycarbonate) containers.

10% Methoxylamine Hydrochloride
5g methoxylamine hydrochloride, dissolve in 50mL DI water
storage: EXTRACTION REAGENTS-small clear bottle
2.0 N sulfuric acid (H$_2$SO$_4$)

55.5 ml conc. sulfuric acid, dilute to 1.0 L with water

END OF DOCUMENT
I. Policy: The technical review process addresses the appropriate use of analytical controls; correct interpretation based on analytical controls; and the consensus of results between the examiner and the reviewer. This process ensures the conclusions of the analyst's are reasonable, within the constraints of validated scientific knowledge and supported by examination documentation.

A. Any significant differences in results by the reviewer must be resolved prior to issuing a final result and report.
   1. If a discrepancy is found, the report and notes along with a notation describing the discrepancy is returned to the analyst for correction.

B. Technical review shall be conducted by individuals having experience gained through training in the Toxicology Unit.
   1. Personnel who have successfully passed the Toxicology competency test(s) in all areas encompassing the case are minimally qualified to perform administrative review in the Toxicology unit. However, based on the work load and experience of the analysts the Manager/Supervisor may choose to designate a specific Criminalist as Tech Reviewer in their absence.
   2. Documentation of personnel authorized to perform technical review will be documented on the Training authorization checklist.
   3. The technical reviewer will consider the following scope, which includes, but may not be limited to:
      a. Approved technical procedures used and documented, any deviations in analytical techniques will be included in the case notes
      b. Accuracy of test reports
      c. Results properly transferred from notes to report
      d. Screening performed matches the request and laboratory protocol
      e. Immunoassay controls met established criteria
      f. GC/MS positive and negative controls run with case
      g. If identification is made by GC/MS, a drug standard(s) is run with the batch of samples
      h. If selective ion monitoring (SIM) is used, established criteria are met
      i. Limit of quantitation threshold is exceeded to report positive SIM results
      j. Quantitative analysis QC met established criteria before reporting
   4. The Technical Reviewer of screening or confirmation packets will use Screening Session Technical Review Checklist TOXF.05 or Confirmation Packet Technical Review Checklist TOXF.06 which includes scope listed above for each packet reviewed.
      a. The checklist will be signed, dated, and added in LIMS. (In the same request as the run packet)
   5. The Technical Reviewer of a report may use a Report Review Checklist TOXF.02 encompassing the scope listed above.
      a. It is recommended that any newly competent analyst review TOXF.02 prior to submitting cases for technical review.
      b. It is recommended that any technical reviewer that is not currently proficiency tested to reference TOXF.02 upon reassignment to this task.
   6. The author of the report shall not conduct the technical review.
   7. The Administrative review milestone in LIMS reflects the technical and administrative review of the case.
a. The signature of the reviewer on the laboratory report designates technical and administrative review of the report.

b. Multiple analysts may be involved in the technical review process, the administrative reviewer will ensure all batch analysis have been technically reviewed by checking for a technical reviewer signature on each batch analysis.

II. Policy: The administrative review process addresses the case report package for format and content. The reviewer verifies the requested examination has been performed and the basis for the conclusions is supported in the notes.

A. It is the responsibility of the analyst, not the Administrative Reviewer, to prepare and present a completed report package that complies with the Laboratory's policies and is free of errors.

B. All reports will be technically and administratively reviewed by a Manager/Supervisor or a person designated by the Manager/Supervisor.

C. The author of the report will not perform the administrative review.

1. Personnel who have successfully passed the Toxicology competency test(s) for all areas encompassing the case are minimally qualified to perform administrative review in the Toxicology unit. However, based on the workload and experience of the analysts the Manager/Supervisor may choose to designate a specific Criminalist as Admin Reviewer in their absence.

2. Documentation of personnel authorized to perform administrative review will be documented on the Training authorization checklist.

3. The Administrative Reviewer may use a Report Review Checklist TOXF.02 encompassing the scope listed below.

a. It is recommended that any newly competent analyst review TOXF.02 prior to submitting cases for administrative review.

b. It is recommended that any administrative reviewer that is not currently proficiency tested to reference TOXF.02 upon reassignment to this task.

D. Administrative review will take place prior to the release of the report. Refer to FSD.43 for requirements to release information verbally.

1. The administrative reviewer will consider the following scope, which includes, but may not be limited to:

a. All information is correct on case report header (agency case number, name, agency, offense, request date, etc.)

b. The administrative and examination records are uniquely identified.
   i. The unique identifier is the laboratory number.
   ii. There is a clear identification of the end of the report.

   c. Proper report format followed per Division policy

d. The signature (or electronic equivalent) of the author appears on the report

e. NMS Labs reports are consistent with the request.
   i. All case identification is consistent with information in LIMS
   ii. All pages of the NMS report are included.

f. Clarity of conclusions in report
   i. Date(s) of analysis are stated accurately
   ii. Uncertainty of each analyte reported quantitatively will be listed in the report annex.
   iii. Inconclusive results include a report comment with a reason.

   g. Method(s) used or analytical techniques employed listed on report

   h. The description and identification of submitted items is clear
   i. The tape-sealed condition of the outer packaging is noted

   j. Chain of custody documented in report and LIMS. The date of request is included on the report. The date of receipt of evidence is in the report annex.
      i. Chain of custody on envelope is consistent with the chain of custody in LIMS.
k. Evidence items listed on request form correspond to reported items
l. The notes are legible
m. Correct grammar and spelling
n. All handwritten corrections to notes shown by initialed single line strike-out, if applicable
o. All handwritten notes in ink, if applicable
p. All notes pages, including data, are properly marked with lab number, date and initials
   i. Any notes pages generated by other analysts are properly marked with lab number, initials and date.
q. The first and last notes page includes the total number of pages
r. Applicable worksheets used
s. Disposition of the evidence is included in the report.
t. Any communication is documented in the notes or telephone log documents and may be imaged into the case notes.

END OF DOCUMENT
I. Policy: Managers/Supervisors or persons designated by the Manager will review the testimony of their staff annually according to the following procedure.

A. Each analyst providing testimony will be technically reviewed by an individual who is technically competent in the tasks the review is encompassing. See FSD.26.

1. A review must be done in each discipline in which the analyst testifies at least once per calendar year.

2. Technical review is typically documented on the Internal Court Critique Form FSDF.02 according to the procedure outlined in QA.13.

B. Court Critique Forms are also available to staff members to encourage input from judges, attorneys, or peers regarding employee performance for courtroom testimony. The forms cannot be used in lieu of technical review of testimony. FSDF.03

C. There are other means of review of testimony that include, but may not be limited to, reviewing transcripts. Refer also to the Division Manual policy on Courtroom Testimony Monitoring FSD.26.

D. Individuals shall be given feedback regarding their courtroom monitoring. Documentation of feedback will be maintained in LIMS.

1. The testimony review consists of:

   a. An evaluation of technical correctness or "content review"

   b. An evaluation of courtroom demeanor or "style review"

E. The Manager or Supervisor is responsible for assessing the feedback provided by the individual performing the review and determining if follow-up or additional action is required.

1. Deficiencies in the technical content of an analyst's testimony will be addressed per FSD.15.

2. Suggestions for improvement to the analyst's style will be addressed at the discretion of the Manager or Supervisor.

F. The records of testimony monitoring shall be retained for at least the current accreditation cycle.

G. If an individual does not testify in the calendar year, the Supervisor/Manager will document this according to the Division Manual policy.

II. Policy: Proficiency samples will be submitted to each analyst who performs testing, or an activity which contributes to the quality of testing, on a yearly basis.

A. These samples will be supplied by an outside agency, internally, or blind.

1. The samples may be for screening, confirmation or both.

2. When participating in proficiency testing, the Toxicology Unit's own approved and documented test procedures shall be used.

3. Criteria for passing an external toxicology proficiency:

   a. The expectation is that staff correctly identify all drugs the lab is capable of testing.

   b. If the drug is quantitated and the vendor provides statistics (grand mean and standard deviations), the laboratory quantitative value should be within 2.5 standard deviations of the grand mean. Values between 2.5 and 3 standard deviations will be evaluated and action may be taken by the laboratory. Values outside of 3 standard deviations are considered unsuccessful and corrective actions will be taken and documented through the QA Action process.
c. If the drug is quantitated and the vendor does not provide statistics, the laboratory quantitative value should be within 25% of the mean value from the Vendor Summary Report.

4. Criteria for passing internal toxicology proficiency (spiked samples)
   a. The qualitative result must be the same as the spiked sample
   b. The quantitative result must fall within +/- 20% of the expected target value

5. Preparation of internal proficiency samples (spiked samples)
   a. Not all analytes within an extraction are required to be present
   b. Traceability information will be recorded including lot numbers of standards, lot number of blank matrix, serial numbers for equipment
   c. If an analyte with known stability issues is included:
      i. The preparation of sample, logging in of proficiency and analysis within the toxicology unit must be coordinated to ensure the sample can be analyzed in a timely manner
      ii. If appropriate, sample may be frozen until it can be analyzed
      iii. If the proficiency cannot be completed within the assigned due date, the analyst will communicate with the supervisor. The supervisor will determine whether a new sample will be made or an alternate analyte/extraction will be chosen.

6. See Division Manual policy on Proficiency Testing for more information about complying with Proficiency Review Program from the laboratory's accrediting body. FSD.23

7. The laboratory shall maintain records of proficiency testing, including:
   a. The test set identifier
   b. How samples were obtained or created
   c. Identity of the person taking the test
   d. Date of analysis and completion
   e. All data and notes supporting the conclusions
   f. Proficiency test results
   g. Discrepancies noted (refer to the Division Manual Policy)
   h. Indication that performance has been reviewed and feedback provided to the analyst
   i. Details of any corrective action taken (refer to the Division Manual Policy)

8. Records shall be retained not less than one full accreditation cycle.

END OF DOCUMENT
I. Policy: New procedures or methods of analysis must be validated or verified before use in casework.

A. Any new method or procedure or adjustment to a current procedure must be tested in the laboratory to ensure that the method or procedure works, the verification or validation shall be as extensive as necessary. The laboratory shall record the results and document the procedure. Approval of the method for use in casework is documentation that the method is fit for toxicology analysis.

1. A Quality Action Request, or equivalent, should be generated and given to the Manager/Supervisor to be approved; then forwarded to the Quality Assurance Coordinator.

2. For more information on validation of methods see the Division Manual.

B. Selection of Methods

1. Screening samples by immunoassay is appropriate for reporting the possible presence of a class of drugs in a sample and meets the needs of the customer. The objective and scope of analysis is the presumptive screening of samples for classes of drugs.

2. Confirmation of samples by gas chromatography mass spectrometry is appropriate for identification or qualitative analysis of drug(s) in samples and meets the needs of the customer. Confirmation may also include quantitative analysis. The objective and scope of analysis is the identification of drug(s).

3. The customer shall be informed as to the method chosen by the Toxicology Unit by listing the analytical techniques on the report.

4. The following factors shall be taken into account in developing test methods and procedures:
   a. Human factors
   b. Accommodation and environmental conditions
   c. Test and calibration methods and method validation
   d. Equipment
   e. Measurement traceability
   f. Sampling
   g. The handling of test and calibration items

C. Guidelines for Performance Verification

1. The purpose of performance verification is to ensure that a previously validated method, or method from a manufacturer, will work in the Laboratory with the Laboratory's procedure's and instrumentation.

2. Performance verification should consist of evaluation of the validated method, without making significant changes to sample preparation or instrument parameters, and demonstrating that the standards or controls have been carried through the process and yielded the expected results.

   a. Prior to implementation of a validated method new to the laboratory, or a method from a manufacturer, the reliability of the procedure shall be documented in-house to ensure it is reliable.

   b. Records of performance verification shall be maintained.

3. Qualified personnel criteria for a Performance Verification:

   a. For an instrument verification, an analyst who is competent in the unit can complete a performance verification.
b. An analyst who is competency tested or in training can acquire data to be evaluated for the performance verification.

c. For new technology (such as instrumentation), an analyst who is competent in the unit can complete a performance verification.

D. **Qualified personnel criteria for a Method Validation:**

a. For a method validation, an analyst who is competent and currently proficient in the unit can plan and coordinate a method validation.

b. An analyst who is competency tested or in training (with supervisor/manager approval) can acquire data to be evaluated by a competent analyst for a method validation.

c. For new technology (such as instrumentation), an analyst who is competent and currently proficient in the unit can plan and coordinate a method validation.

E. **Guidelines for Method Validation—Quantitative Confirmation**

1. Method validation is required on new methods, methodology or procedures. Validation is the confirmation of the requirements for identification and quantitation of drugs.

2. Methods developed by the laboratory for its own use will be a planned activity and assigned to qualified personnel. Plans will be updated as development proceeds and effective communication between the analyst and Supervisor/Manager will be ensured.

3. Documentation is required. A written description of the method used, instrument parameters, reproducibility data, and any other data (such as the criteria listed below) should be documented and available for review.

4. A method validation should consist of

   a. Selecting the compounds for identification and quantitation. This may be accomplished by researching the drug of interest and looking at elimination kinetics in the appropriate matrix (blood or urine) to determine if the parent drug is an appropriate compound to use for identification, and what metabolites (if any) should be identified.

   b. Evaluation of the range and accuracy of values obtained from the validated method, including uncertainty for reported quantitative values.

   c. Selecting a suitable specimen size or volume of sample to be used.

   d. Selecting suitable standards and quality control materials, including selection of concentrations. This may be accomplished by selection of standards and quality control materials from different manufacturer's to "check" the concentration of one against the other. The standards and quality control reference materials are "matrix matched" to the samples being extracted. Traceability is required for reported quantitative results.

   e. Selecting a suitable internal standard. This may be accomplished by selecting an internal standard with chemical and physical properties as similar as possible to the drug(s) of interest. Stable isotopes (e.g., deuterated) standards are recommended for GC/MS assays, although non-deuterated standards may also be used. The internal standard should be added at the earliest possible stage in the extraction so that the internal standard is taken through the extraction process.

   f. Establishing selectivity for the drug of interest. This may be accomplished by running similar compounds with the same temperature program to establish different retention times and/or ions of interest to demonstrate that compounds in the same "family" will not be misidentified due to similar retention times and sharing of common ions.

   g. Establishing the linearity of the method. This may be accomplished by running standards of a known concentration to establish the upper and lower limits of linearity for the extraction. When the limit of detection (LOD) and limit of quantitation (LOQ) is being selected (drug use patterns for the drug of interest should be taken into account, including therapeutic ranges. Linearity should be demonstrated by a minimum of three standards as calibrators of the curve.

   h. Evaluating Robustness of the method or procedure against external influences, and/or cross-sensitivity against the matrix of the sample tested, and/or variations in equipment or personnel.

   i. Establishing lack of carry-over. This may be accomplished by running standards higher than the highest calibrator and establishing that no carry-over is present in the next sample. For quantitative analysis, this is a sample that is typically 10 times greater than highest calibrator.
j. Establishing criteria for acceptance of chromatographic calibration. This may be accomplished by stating in the method the minimum criteria for a passing run:
   i. Correlation coefficient or "r2" value (for quantitative analysis, typically above a 0.96)
   ii. Ion ratios within specified range (for quantitative analysis, typically above a +/- 20% absolute)
   iii. QC values passing (for quantitative analysis, typically +/- 20% of known value)
   iv. Retention times acceptable for samples (for quantitative analysis, typically +/- 3% of standard retention times)
   v. Blank is negative (for quantitative analysis, typically blank is below LOQ)
   vi. Acceptable chromatography (sufficient peak shape and resolution)

F. Guidelines for Method Validation-Qualitative Confirmation

1. The guidelines for qualitative method validation are the same for quantitative method validation, as indicated above, and should be evaluated and documented, with the following exceptions:
   a. Evaluation of uncertainty is not required.
   b. Selection and evaluation of quality control samples is not required.
   c. Establishing linearity is not required. However, it is suggested an appropriate cut-off sample and high sample are selected that will encompass the range of values expected to be encountered in casework.

2. The analyst should establish criteria for acceptance of chromatographic calibration. This may be accomplished by stating in the method the minimum criteria for a passing run:
   a. Ion ratios within specified range (typically above a +/- 20% absolute)
   b. Retention times acceptable for samples (typically +/- 3% of standard retention times)
   c. Blank is negative (typically blank is below cut-off)
   d. Acceptable chromatography (sufficient peak shape and resolution)

3. Documentation is required. A written description of the method used, instrument parameters, reproducibility data, and any other data (such as the criteria listed above) should be documented and available for review.

G. Guidelines for Method Validation-Immunoassay Screening

1. A method validation should consist of:
   a. Selecting the target analyte and sample matrix for screening. This may be accomplished by abiding by the suggested analytes from the manufacturer of the specific immunoassay plate kits.
   b. Selecting a suitable specimen size and dilution. Manufacturer’s suggestions will be considered. The selection of the specimen size and dilution will aide in determining the anticipated results for the blank/negative matrix sample.
   c. Selecting appropriate cutoff for the assay. If possible, the cutoff for the assays should coincide with the established LOQ for the corresponding confirmatory analysis for the drug group of interest. The results for the immunoassay cutoff should have a significant difference from the result of the blank/negative matrix sample.
   d. Specificity/selectivity should be considered by the analysis of controlled substances that are similar to the drug group of interest. The list of controlled substances may contain the controlled substances that the manufacturer has listed in their cross-reactivity information or may include available controlled substances to the drug group of interest.
   e. Establishing repeatability by analyzing at least five replicate samples of known composition at an amount between twice the cutoff to four times the cutoff. The number of false negative should not exceed more than one sample in five replicates. The number of runs for establishing repeatability should be at least two.

2. Documentation is required. A written description of the method used, instrument parameters, reproducibility data, and any other data (such as the criteria listed above) should be documented and available for review.

H. Software

1. When computers or automated equipment are used for the acquisition, processing, recording, reporting, storage or retrieval of test data, the laboratory shall ensure that laboratory configured software is suitably validated and
2. Commercial off-the-shelf software used within its designed application range will be considered to be sufficiently validated. In the Toxicology Unit, this may include, but is not limited to:
   a. Agilent ChemStation software and firmware
   b. Agilent MassHunter software and firmware
   c. Libraries used for presumptive identifications
   d. Dynex Revelations Software and firmware

3. Documentation of software validation will be reviewed by a Supervisor/Manager prior to approval for use. If the software is controlled or approved through the use of a software log, the approval initials in the log will document the review and approval of the validation. If the software is controlled or approved through PowerDMS, the electronic approval signature will document the review and approval of the validation.

I. Equipment

1. Equipment that is new to the laboratory shall be properly evaluated to ensure its reliability. The evaluation will be documented.
   a. If the type of equipment already exists within the laboratory and additional equipment of the same type is obtained, a verification of the equipment may be satisfactory to ensure its reliability. This verification shall ensure that the equipment is operating properly. This will be evaluated by the Supervisor/Manager.
   b. If the equipment is a new methodology or the operation is significantly different from equipment already in the laboratory, validation, training and an associated competency may be necessary. This will be evaluated by the Supervisor/Manager. The competency test will meet the requirements of the laboratory's accrediting body.

2. Before being placed into service, equipment shall be calibrated or checked to establish that it meets the laboratory's specification requirements. It shall be checked or calibrated before use in casework.

END OF DOCUMENT
I. Policy: Analysts or outside service technicians perform calibration checks and maintenance of equipment and instruments.

A. The Toxicology Unit is furnished with the measurement and test equipment required for the correct performance of tests.

1. The measurement equipment includes:
   a. Eppendorf Pipettors, or equivalent, adjustable volumes: various sizes and ranges
   b. Repeating Pipettors (Ripette or equivalent)
   c. Serialized volumetric flasks, Class A: various sizes

2. When equipment is transported to an external calibration laboratory, it should be packaged and transported to prevent damage.

   a. The laboratory specification for the calibration for the above listed equipment are typically documented in a letter sent to the external calibration laboratory along with the equipment or is maintained in a customer file at the external calibration lab. A copy of the letter is also retained in the laboratory.

3. The test equipment includes:
   a. Agilent Gas Chromatograph/Mass Spectrometer (GC/MS)
   b. Dynex DSX
   c. Hamilton digital dilutor with hand probe, Model 500, or equivalent
   d. Thermo Scientific Orion Star A111 pH meter, or equivalent
   e. Centrifuge
   f. Heating block
   g. Evaporator
   h. Volumetric flasks, Class A: various sizes
   i. Balance
   j. Vortex Mixer

B. The equipment listed and its software used for testing is capable of achieving the accuracy required for qualitative and quantitative testing of suspected controlled substances in biological fluids.

C. Equipment will be operated by authorized personnel. The authorization will be documented on the authorization checklist.

D. Each piece of equipment and its software significant to the test result in the toxicology unit is uniquely identified.

E. Before being placed into service, equipment will be calibrated or checked to establish that it meets the laboratory's requirements. The test equipment shall meet the vendor's performance check criteria or the laboratory criteria before being used. The check criteria will be documented.

   1. All new pipettes or serialized volumetric flasks will be calibrated before being used in casework.

F. After being placed into service, equipment will be calibrated or performance checked to establish that is continues to meet the laboratory's requirements. If equipment does not pass a performance check criteria or calibration tolerances (eg. AS FOUND data listed on the calibration certificate), an evaluation of the equipment's impact on casework will be completed and documented.
1. When an evaluation determines that the reported results are not affected, a level 2 log entry will be cross referenced in the equipment calibration log.

2. When an evaluation determines the reported results are affected, the impact will be documented through the QA ACTION process. See FSD.15

G. GC/MS

1. Each uniquely identified GC/MS in the Toxicology Unit has an accompanying maintenance binder or electronic equivalent that includes:
   a. The identity of the equipment, given as the laboratory assigned identifier and software (version number or equivalent)
   b. The manufacturer's name and serial number or other unique identification
   c. The Tune reports to ensure the equipment complies with specifications
   d. The dates, results or reports of any adjustments. The report of the tune indicates acceptance criteria for use in casework
   e. Any damage, malfunction or repair
   f. Documentation of maintenance carried out

2. The instructions for use of GC/MS and the maintenance plan are contained in the Toxicology Unit manual:
   a. See GC/MS Dean Switch
   b. See GC/MS Routine Maintenance
   c. See GC/MS Cleaning the Ion Source
   d. See GC/MS Changing the Column
   e. See GC/MS Cleaning the Inlet
   f. See GC/MS Vacuum Pump Maintenance
   g. See GC/MS Using the Software-Comparative Identifications
   h. See GC/MS Using the Software-Quantitative Identifications
   i. See GC/MS Using the Software-Sequences
   j. See Instruments-Storage of Data
   k. See GC/MS References

H. Dynex DSX

1. The uniquely identified instrument in the Toxicology Unit has an accompanying maintenance binder or electronic equivalent that includes:
   a. The identity of the equipment, given as the laboratory assigned identifier and software (version number or equivalent)
   b. The manufacturer's name and serial number or other unique identification
   c. The self checks which are diagnostic checks that the equipment complies with manufacturer's specifications
   d. The dates, results and copies of reports or certificates of maintenance or adjustments
   e. Any damage, malfunction or repair
   f. Documentation of maintenance carried out

2. The instructions for use of the Dynex and the maintenance plan are contained in the Toxicology Unit manual:
   a. See Performing Immunoassays
   b. See Dynex Operation
   c. See Dynex Maintenance
   d. See Dynex References

I. Variable Pipettes and Repeating Pipettes
1. The term pipettes will apply both to single use (variable) and repeating pipettes

2. The uniquely identified Pipettes in the Toxicology Unit have a maintenance binder or electronic equivalent that includes:
   a. The identity of the pipette
   b. The manufacturer's name and serial number or other unique identification
   c. The annual external calibration which indicates that the equipment complies with specifications as listed on the calibration certificate
   d. The dates, results and copies of reports or certificates of maintenance or adjustments
   e. Any damage, malfunction or repair
   f. The documentation of the maintenance is in the maintenance log.

3. The instructions for use and the maintenance plan are contained in the Toxicology Technical Unit Manual.
   a. See Diluters and Pipettes

J. Balances

1. The uniquely identified balance in the Toxicology Unit has a maintenance binder or electronic equivalent that includes:
   a. The identity of the balance
   b. The manufacturer's name and serial number or other unique identification
   c. The Monthly Calibration checks that the equipment complies with specifications as indicated in Balances
   d. The dates, results and copies of reports or certificates of calibrations or any adjustments.
   e. Any damage, malfunction or repair
   f. Documentation of maintenance carried out

2. The instruction for use and the maintenance plan are located in the Toxicology Unit manual.
   a. See Balances

K. pH Meter

1. The pH meter in the Toxciology Unit has a maintenance binder or electronic equivalent which includes:
   a. The identity of the pH meter
   b. The manufacturer's name and serial number or other unique identification
   c. The calibration checks performed, and the buffer levels used
   d. The dates, results and copies of reports or certificates of calibrations or any adjustments.
   e. Any damage, malfunction or repair
   f. Documentation of maintenance carried out

2. The instruction for use and the maintenance plan are located in the Toxicology Unit manual.
   a. See pH Meter

L. Volumetric Flasks

1. Flasks are divided into two categories: serialized and non-serialized

2. Serialized flasks are uniquely identified and used to prepared standards for quantitative analysis, and have a binder or electronic equivalent which includes:
   a. The identity of the flask
   b. The manufacturer's name and serial number or other unique identification
   c. The Calibration checks performed
   d. The dates, results and copies of reports or certificates of calibrations or any adjustments.
   e. Any damage, malfunction or repair
f. Documentation of maintenance carried out

3. Non-serialized flasks are not calibrated or documented

4. The instructions for use and the maintenance plan are contained in the Toxicology Technical Unit Manual.
   a. See Glassware

M. Thermometers

1. Thermometers are only occasionally used by the toxicology unit. The toxicology unit may use the thermometers maintained in the Alcohol Unit.

2. The instructions for use and the maintenance plan are contained in the Blood Alcohol Technical Unit Manual.

N. Diluters-Hamilton 500 or equivalent

1. Each uniquely identified diluter in the Toxicology Unit has a maintenance binder or electronic equivalent that includes:
   a. The identity of the diluter
   b. The manufacturer's name and serial number or other unique identification
   c. The Calibration checks that the equipment complies with specifications as indicated in Diluters and Pipettes
   d. The dates, results and copies of reports or certificates of calibrations or any adjustments.
   e. Any damage, malfunction or repair
   f. Documentation of maintenance carried out

2. The instructions for use and the maintenance plan are contained in the Toxicology Technical Unit Manual.
   a. See Diluters and Pipettes

O. Centrifuges

1. Centrifuges are used to separate samples into layers (solid/liquid or liquid/liquid)

2. The speed of the centrifuge is not critical for analysis, nor is the exact time of centrifugation

3. Speeds may be indicated on the centrifuge as a number (1-10) or RPM, depending on model.
   a. Speeds indicated in extraction methods are suggestions.
   b. The analyst may use the settings that produce the desired separation.

4. Centrifuges are not uniquely identified or documented.

P. Evaporator

1. An Evaporator is used to reduce the liquid volume of a sample by applying heat and nitrogen gas or air flow.

2. The temperature, air flow and time are not critical for analysis

3. Evaporators are not uniquely identified or documented

Q. Heating Block

1. A heating block is used to apply heat to samples, it is typically employed for hydrolysis or derivatization

2. Temperatures listed in methods do not have to be exact

3. Temperature of a heating block can be monitored using a thermometer placed directly into the heating block
   a. Heating blocks and thermometers can be verified with a NIST traceable calibrated thermometer
   b. Heating blocks are not uniquely identified or documented

R. Vortex Mixer

1. The mixer is used to mix samples

2. This can be for single or multiple tubes

3. Neither the speed nor the amount of time at which the samples are mixed are critical

4. Vortex Mixers are not uniquely identified or documented
S. Equipment that needs repair shall be taken out of service. It shall be clearly marked or labeled as being out of service until it has been repaired and/or shown by calibration or test to perform correctly. If there is a concern that the defect affected previous tests, the laboratory shall investigate. Any investigation will be documented and referenced appropriately and retained in the unit.

T. Equipment can be cleaned with isopropanol, methanol, a diluted bleach solution or any other suitable chemical.
   1. External surfaces of pipettes used to dispense blood or urine should be disinfected with a diluted bleach solution after all samples have been dispensed in a batch

U. Test equipment will be handled according to procedures in the SOP and in accordance with training such that the equipment is safeguarded from adjustments which would invalidate the test and/or calibration results. If any damage, malfunction or repair is needed the equipment will not be used for casework until remedial action is taken.
   1. Procedures for proper use of the GC/MS, Dynex, pipettes, Hamilton Diluter, volumetric glassware, pH meter, and balance can be found in the associated sections of this technical unit manual. By following the procedures and using equipment in accordance with proper training, equipment will be safeguarded from adjustments that may invalidate test results.

V. Accommodations and Environmental Conditions
   1. The laboratory is in a climate controlled building and the lighting and energy sources are suitable for general toxicology analysis
   2. There are no environmental conditions in the technical requirements for general testing of drugs that need to be documented or monitored
      a. Specific methods may include additional data about the impact of environmental conditions. A bypass switch is present in the toxicology unit that can be used to maintain the climate controlled conditions after hours if needed.
      b. Reference materials that require refrigeration or freezing are stored in a refrigerator or freezer which is monitored
   3. If power to equipment is lost, analysts will ensure that it is working properly prior to resuming toxicology analysis.
   4. Access to areas of the laboratory are limited and controlled.
      a. There is separation between drug unit and toxicology units, where cross contamination may occur. Analysts from toxicology remove lab coats before entering drugs and vice versa.
   5. Analysts are responsible for maintaining a clean work area and general lab cleanliness. Trash is picked up from the lab and routine cleaning is performed by General Services Department (GSD). Non-routine cleaning (eg., floor waxing, etc.) is scheduled with General Services Department (GSD)

W. Temperature Monitoring System
   1. The laboratory will utilize an online temperature monitoring system (such as Freshloc) to record refrigerator and freezer temperatures.
      a. Refrigerators or freezers that contain reference materials, standards or evidence may be monitored.
      b. A sensor will be placed in the refrigerator or freezer.
         i. The monitoring system will collect temperature data from each the sensors approximately every 5 minutes.
         ii. Criteria for acceptable temperature ranges will be determined by the laboratory.
         iii. If the sensor reads outside of the acceptable criteria and email will be generated by the monitoring system to lab staff.
      c. If a sensor fails to read or record an email will be sent to lab staff.
         i. Lab staff will re-mediate any problems encountered by the equipment.

END OF DOCUMENT
I. Policy: The following is the policy for controlling software and tracking the version of software in use in the Toxicology Unit.

A. Software

1. Validation of Software
   a. If the software is off-the-shelf software, no validation or verification is required.
      i. If this software is used to make calculations that would affect the result, the application of that software (e.g., formulas) may need to be validated.
   b. If the software is "custom" or developed by the user, then documentation of validation or verification is required. See Validation for more information about Software.

2. Identification and Control (or Approval) of Software
   a. Any version of Microsoft Word, Excel, Access, ActiveSync, Adobe Reader, Adobe Pro, PDFCreator, JusticeTrax Indexer, JusticeTrax Batch Image Capture, or MiniTab is considered to be approved for use and does not need to be uniquely identified or approved.
      i. If this software is used to make calculations that would affect the result, the application of that software (e.g., formulas) may need to be uniquely identified (e.g., excel spreadsheet) and approved for use (e.g., as a document in PowerDMS).
   b. For the barcode scanning devices, any version of SSE Technologies Comparison Checker software is considered approved for use and does not need to be uniquely identified or approved.
   c. Equipment and its software need to be uniquely identified and approved for use.
      i. The identity, version of software or equivalent, will be logged in the maintenance binder for each piece of equipment used for qualitative and quantitative testing. See Care and Maintenance of Equipment. The control or approval for use should be documented in the maintenance log by the Manager or Supervisor.
   d. Custom or user-developed software needs to be uniquely identified and approved for use. The control or approval for use should be documented by the Manager or Supervisor.

3. Software Upgrades/Changes/Additions
   a. Manufacturer's technical support personnel, technical personnel contracted by the Laboratory, technical services personnel and approved lab staff may make changes, additions or upgrades to software.
      i. Only Laboratory staff designated by the Manager or Supervisor should make changes, additions or upgrades to custom or user developed software. The documentation of approval by the Manager or Supervisor on the Software log will be considered as documentation that the Laboratory staff that made the change was designated to do so by the Manager or Supervisor.

B. Chemstation Macros are present on certain GC/MS instruments within the Toxicology Unit. They are sometimes edited to accommodate any changes in Chemstation software or instrument installed. A Verification is performed when changes occur. A log of any changes/edits are kept in the instrument maintenance log.

C. The Toxicology Unit has a Traceability Database that is an MS Access database program created and maintained by laboratory staff. The purpose of the Traceability Database is to maintain records regarding all equipment used within the unit. Information from reference materials inventory to chemicals, glassware and instruments used to analyze samples for controlled substances content. For more information on the Traceability Database see TOX.64 Toxicology Tracking Database which includes operation, functionality, instructions for use, data entry, and backing up data.

1. The Toxicology GCMS Worksheet that is included in the notes of each toxicology report displays all of the traceability data for the run.
2. Changes to the toxicology tracking database are kept in a log for the database by laboratory staff.
3. The toxicology tracking database is backed up routinely onto an external hard drive at least every month.

D. The Toxicology Unit will validate crystal templates used for final LIMS Case Reports and Notes.

1. The following is the procedure for LIMS generated report and note validation:
   a. Any relevant changes in the Technical Unit Manual and any other related procedures need to be updated prior to implementing the changes in the LIMS crystal reports.
   b. Ensure that all of the outstanding reports have been Administratively Reviewed.
      i. Reports in Progress (i.e. extraction in progress, results manually entered) are unaffected during the validation process as long as notes are not printed for the Case File.
   c. LIMS administrator can now make the necessary changes.
   d. Log off of LIMS and then log back into LIMS to ensure that the current updated crystal reports are loaded into LIMS at your workstation.
   e. Obtain a copy of the Uncertainty Budget that is to be approved
      i. An excel document can be found in Muir Lab network share (LAB\MUIR\1-MUIR ALL\Uncertainty Budget Committee\Uncertainty Budgets\Tox Budgets)
      ii. Obtain a printed copy of the crystal report for the final LIMS Case Report and the Notes with the Uncertainty Budget that is to be approved, see LIMS administrator for assistance.
      iii. Check the excel document with the crystal reports.
   f. Open the Excel spreadsheet "LIMS Report Validation Template" located on the Toxicology Unit network share (LAB\MUIR\1-TOX\LIMS Report Verification)
      i. Update the UOM values in the spreadsheet.
      ii. Update cells as necessary based on the newly calculated values.
   g. Laboratory Report Number 12-2191 has been created for Toxicology report verification purposes.
      i. The numerical results do not need to be changed for each analyte, but can be if warranted.
      ii. Print the report and notes for all of the requests associated with uncertainty.
      iii. Laboratory Number 12-2191 is a test case, so not all requests may pertain to the Uncertainty of Measurement validation.
   h. Compare the values in the spreadsheets with what has been printed in the LIMS reports and notes.
      i. Rounding procedures for the result and the uncertainty are as follows:
         i. The reported uncertainty for an analyte cannot exceed two significant figures and should not exceed the number of decimal places of the calculated results.
         ii. The uncertainty calculation is rounded up using the GUM rounding method. (Examples below for a three digit result.)
            1. 0.0211 is rounded to three decimals as 0.022
            2. 0.0210 is rounded to three decimals as 0.021
            3. 0.0041 is rounded to three decimals as 0.005
            4. 0.0040 is rounded to three decimals as 0.004
         iii. The report and the analytical result are not to exceed the same number of decimal places as the reported uncertainty (i.e. 0.500 mcg/mL ± 0.075).
            1. If the reported uncertainty has fewer decimal places than the calculated result, the result is truncated (i.e. a result of 0.756 mcg/mL ± 0.26 is truncated to 0.75 mcg/mL ± 0.26)
         iv. The number of significant figures of the report result and analytical result may exceed the number of significant figures of the reported uncertainty (i.e. a result of 1.256 mcg/mL ± 0.32 is reported as 1.25 mcg/mL ± 0.32 or a result is reported as 0.025 mcg/mL ± 0.006)
      j. Open the Word document titled "LIMS Report Verification Template" located on the Toxicology Unit network share (LAB\MUIR\1-TOX\LIMS Report Verifications)
i. Update the applicable changes to the report.

k. Save both the Excel and Word documents on the network share (LAB\MUIR\1-TOX\LIMS Reports Verifications)
   i. create a new sub-folder with the year of validation as the title if necessary

l. Submit the following documents to the Supervisor or Manager for review:
   i. Excel Spreadsheets
   ii. Word Documents
   iii. Crystal Report print out
   iv. Printed reports and notes for all of the requests validated.

m. The LIMS administrator will document written notification (i.e. e-mail) of the changes made in LIMS report and note templates.

n. Make a new entry in the "Toxicology Unit Software Verification Binder."
   i. Entry should be signed off by a Supervisor or Manager.
   ii. Include all paperwork submitted for review and the LIMS administrator's written notification.

END OF DOCUMENT
I. Policy: Balances will be calibrated and checked to ensure their reliability.

A. New or Serviced Balances

1. A balance new to the laboratory, or a balance that has been serviced or has undergone substantial maintenance will be calibrated before being used in casework.

B. Annual Calibration

1. The balance in the toxicology unit will be calibrated yearly.
2. The laboratory will maintain copies of the certificates obtained for at least the current five year accreditation cycle.
3. The external calibration service should label the balance to indicate the calibration status, including the last calibration and the recommendation for the next calibration.

C. Monthly Accuracy or Calibration Check

1. The balance in the Toxicology Unit will be checked monthly to ensure that it is operating satisfactorily. This procedure shall be performed by an analyst or a specialist.

   a. Calibration or accuracy checks must be done with reference standards that are NIST (National Institute of Standards and Technology) traceable or using American Society for Testing and Materials (ASTM) - ASTM 1 or ASTM 2 weights.

   b. The results of the check will be logged. During the monthly check, the balance should also be checked for cleanliness and to ensure that it is level.

2. Procedure for checking the calibration of the balances in the Drug, Alcohol and Toxicology Section.

   a. Turn the balance on
   b. Ensure that the balance is level
   c. Tare the balance to a zero weight (0.000)
   d. Place the weight (M1) on the center of the balance. (See Table 1 for the reference standard M1 as appropriate for each balance).
   e. Record the weight result in the Balance Calibration Log
   f. Remove the reference standard (M1)
   g. Tare the balance to a zero weight (0.000)
   h. Repeat with the reference standard M2. (See Table 1 for the reference standard M2 as appropriate for each balance).
   i. Record the weight result in the Balance Calibration Log
   j. Remove the weight (M2)

3. Refer to Table 1 for the allowable error range

4. If the balance falls outside the acceptable range the balance must be taken out of service. Calibration or adjustment shall be performed by an external calibration service which meets the guidelines of ANAB ISO/IEC 17025.

5. The following references were used during the development of this procedure:

   a. Instruction Manual for Precision Advance Electronic Balances, GT Series. Ohaus

D. **Instructions for weighing on the balance.**

1. Balances are not typically used directly in casework in the toxicology unit. The balance is used to weigh out a specified amount of chemical in preparing reagents. The following instructions apply to the weighing of a substance to achieve a target amount.

   a. Place the weighing media near the center of the scale. Tare the weighing media.
   b. Dispense estimated amount of item to weighing media.
   c. Check weight, add or remove sample as necessary to obtain a weight near target.
   d. Close the draft cover (if applicable).
   e. Allow time for balance to settle. If the balance will not settle (more than 10 seconds and still fluctuates) use the lowest weight.
   f. Observe the weight. Compare to target weight in reagent recipe.
   g. Repeat steps above (3-6) until target weight is achieved.

E. **Handling of Equipment:** Follow the instructions for using the equipment. The balance should not be adjusted by laboratory staff as this may invalidate the calibration. If adjustments are necessary, the equipment will be sent out for adjustment and calibration.

F. **Reference Standards**

1. The reference standards, check weights, will be checked yearly by an external calibration service that is ISO 17025 compliant. The certificates obtained will contain the measurement results including the measurement uncertainty and/or statement of compliance with an identified metrological specification. See FSD.28 and FSD.30.
   a. The Drug unit will evaluate the certificates and report correction factors to the UOM committee for evaluation.

2. The laboratory will maintain copies of the certificates obtained for not less than the current five year accreditation cycle.

3. All reference standards will be stored, handled, used and transported in a manner that prevents contamination, deterioration and protects the integrity of the reference standard. This includes:

   a. **Storing reference standards in the packaging provided by the manufacturer to prevent deterioration.**
b. Handling reference standards, when practical, with the tweezers provided to minimize deterioration.

c. Using reference standards for their intended purpose, i.e. balance calibration checks.
   i. If a reference standard is dropped, it will be sent out for calibration.

d. Transporting reference standards in the packaging provided by the manufacturer to prevent deterioration. Transporting reference standards may be necessary when weights are transported to/from the external calibration laboratory.

END OF DOCUMENT
I. **Policy:** All instruments used for toxicology analysis are kept in good working order to ensure their reliability. Below are the procedures that should be followed for the care and maintenance of diluters and pipettes in the Toxicology Unit. *(ISO/IEC 17025:2005 5.5.3, 5.5.5.c, 5.5.5.g, 5.5.6)*

A. **Hamilton Diluter (Microlab 500 series)**

1. **New or Serviced Diluters**
   a. A diluter new to the laboratory, or a diluter that has been serviced or has undergone substantial maintenance will be checked before being used in casework.

2. **Accuracy or Calibration Checks** *(ISO/IEC 17025:2005 5.5.10)*
   a. The diluters in the Toxicology Unit will be checked periodically to ensure that they are operating satisfactorily.
      i. See below for the specifications.
   b. The results of the check will be logged in the Hamilton Diluter Maintenance Log.
   c. If the equipment falls outside the acceptable tolerance range the equipment must be taken out of service.
   d. For toxicology analysis, the calibration checks will be performed at least once per year
      i. See procedure below for gravimetric check
      ii. External calibration may be performed by an ISO 17025 compliant vendor, but is not required if used only for screening analysis
      iii. The check, minimally, will include a separate measurement of the right and left syringes and one combined measurement. The accuracy of the mean of at least six replicates must be within ±1% of the target value for volumes greater than or equal to 250 µl. The accuracy of the mean of at least six replicates must be within ±5% of the target value for volumes less than 250 µl.
   iv. Suggested Volumes for checks:

<table>

<tr>
<td>1770</td>
<td>30</td>
<td>1800</td>
</tr>
</tbody>
</table>

3. **Routine Maintenance-Monthly Visual Checks:** The purpose of the visual inspection is to assess wear or build-up. Visual inspections for leaks need to be conducted by either priming the diluter or while in use. Replacement or cleaning should be performed if build-up, wear or leaks are detected. The monthly checks consists of:
   a. Inspection of the tubing and syringes for leaks and build-up
   b. The check will be documented in the Hamilton Diluter Maintenance Log.

   a. The Hamilton Microlab 500 series Digital Diluter is routinely used to dispense known quantities of sample mixed with known quantities of a diluent for immunoassay analysis. The Hamilton 500 series is an instrument which accurately and precisely aspirates and dispenses fluid at the touch of a hand probe button or the tap of a foot switch.
b. The Hamilton Diluter as maintained within the laboratory is a dual liquid solution dispensing unit which combines liquid samples into a single mixture by incorporating two syringes each controlling the amount of each solution volume to be dispensed. One syringe extracts and dispenses solution from a bottle containing internal standard and the other extracts from a desired sampling source.

c. The Hamilton Diluter Microlab 500 series is an easily-programmed instrument ideal for performing multiple dilute and dispense methods. The programmed method is used to dispense the samples. See individual immunoassay methods for the programs.

d. How a Hamilton Microlab Diluter works:

i. **Step 1**: Fill the left syringe with the programmed amount of solvent (diluent) from the reservoir.

ii. **Step 2**: Aspirate the programmed amount of sample into the end of the probe using the right syringe. Steps 1 and 2 may occur simultaneously.

iii. **Step 3**: Dispense the sample and solvent into a vial to complete the dilution.

e. The instructions for general use of the Hamilton Diluter are as follows:

i. The Hamilton Diluter needs to be plugged in. Turn the unit ON with the black rocker switch located on the front right side of the face of the unit.

ii. Make sure the correct bottle with the proper solution is connected to the left syringe unit prior to dispensing.

iii. Flush the syringe several times (3-4 times) with the solution within the bottle to clear out any residual solution/bubbles in the syringe and tubing.

iv. There are preset methods that are programmed into the base unit for dispensing specific volumes. On the Controller Unit follow the menu to load the desired method (i.e. 1:5) press the display key under the display which points to the word "SELECT".

v. Choose the desired method and press the display key under the display which points to the word "SELECT" to load the desired method.

vi. "CONFIRM" the display question whether the installed syringe sizes are correct by pressing the display key under the display which points to the word "CONFIRM".

vii. The "Drive Unit Initialization" Screen is displayed and asks to "CONFIRM" (Display Key under display) that the probe is directed towards a waste area because any fluid in the syringes on the drive unit will be purged.

viii. Dispense the preset volume into a flask, using the probe wand button or foot pedal one time. This will aspirate the fluid from the desired reservoir of diluent and sample.

ix. Press the probe wand or foot pedal again to dispense the volume of each syringe into desired vial.

x. Flush with water repeatedly in between sample dispensing to minimize any carryover.

5. **Handling of Equipment**:

a. Follow the instructions for using equipment.

b. The Diluter should **not** be adjusted by laboratory staff as this may invalidate the calibration. If adjustments are necessary, the equipment will be sent out for adjustment and calibration.

c. External surfaces may be disinfected with methanol or diluted bleach solution

B. **Pipettes**

1. **New or Serviced Pipettes**
a. A pipette (e.g. Eppendorf) new to the laboratory, or a pipette that has been serviced or has undergone substantial maintenance will be calibrated by an ISO 17025 compliant vendor before being used in casework. (ISO IEC/17025:2005 5.6.2.1.1, Supplemental 5.6.1.1)

2. Yearly Calibration
   a. The pipettes in the Toxicology Unit will be calibrated yearly by an external calibration service that is ISO 17025 compliant. The certificates obtained will contain the measurement results including the measurement uncertainty and/or statement of compliance with an identified metrological specification. (ISO IEC/17025:2005 5.6.2.1.1)
   b. The laboratory will maintain copies of the certificates obtained for at least the current accreditation cycle.
   c. The external calibration service labels on each pipette indicate the calibration status, including the last calibration and the recommendation for the next calibration. (ISO/IEC 17025:2005 5.5.8)

3. Accuracy or Calibration Check:
   a. Calibration checks of pipettes may be performed in-house, if needed.
      i. This check cannot be used in place of external calibration
      ii. The check can be performed gravimetrically
         1. See procedures below
   b. Variable pipettes may be checked at multiple levels: ie. one at the high end, one at the low end, and one in the middle range.
   c. The pipette will be checked at the levels checked by the external calibration vendor. The mean of six replicates must be within the criteria provided by the external calibration vendor (ie: percent imprecision).
   d. Documentation of the check will be stored in the Tox Pipette Maintenance Log

   a. Aspirating liquid
      i. The liquid which is to be aspirated is taken from a suitable vessel
      ii. Attach suitable pipette tip to the pipette firmly
      iii. Press down the control button to the first stop
      iv. Immerse the pipette tip vertically approximately 3 mm into the liquid
      v. Allow the control button to slide back slowly
      vi. Pull the top out of the liquid slowly
   b. Dispensing liquid
      i. Hold the tip at an angle against the inside wall of the tube
      ii. Press down the control button slowly to the first stop and wait until the liquid stops flowing
      iii. Press down the control button to the second stop (blow-out) until the tip is completely empty
      iv. Hold down the control button and pull the tip up the inner wall of the tube
      v. Tip is ejected by pressing the control button to the final stop or the ejection button, depending on model
   c. Special Notes
      i. To guarantee the highest degree of precision and accuracy, it is recommended to pre-wet the tip by aspirating and dispensing liquid two to three times before pipetting.
      ii. Make sure to completely empty the liquid from the tip before pipetting (via blow-out).

   a. Inserting and Filling the tip
      i. The liquid which is to be dispensed is taken from a suitable vessel
ii. Push the fill lever down until it stops
iii. Lift the locking lever
iv. Attach suitable tip to the pipette firmly, large volume tips (50) require a separate reusable adapter secured to the top of the reservoir
v. Secure the locking lever
vi. Set the volume adjustment dial for the desired volume
vii. Immerse the pipette tip into the liquid and slowly raise the fill lever upwards. The reservoir does not have to be filled completely, but this will affect the number of “steps” available.
viii. Press the plunger to dispense of the first step

b. Dispensing liquid
   i. Try to hold the tip at an angle to the wall of the container
   ii. Press down the plunger to the stop to dispense liquid
   iii. Each press of the plunger will dispense the same volume
   iv. The total number of steps will depend on the dial setting and the volume of the tip

c. Removing the Tip
   i. Empty the tip completely by pushing the fill lever all the way down.
   ii. Lift the locking lever and remove tip.

6. Handling of Equipment:
   a. Follow the instructions for using equipment.
   b. The pipettes should be stored to prevent jostling that may invalidate the calibration.
   c. The Pipettes should not be adjusted by laboratory staff as this may invalidate the calibration. If adjustments are necessary, the equipment will be sent out for adjustment and calibration.
   d. External surfaces may be disinfected with methanol or diluted bleach solution

C. Gravimetric Check Procedure

1. The gravimetric procedure is done by weighing the amount of water delivered by the apparatus. The mean of six replicates is used to calculate the true volume delivered using the equation below. The temperature of the water is taken to determine the density, see Table below. The results for each check are recorded in the corresponding Instrument Check Log.
   a. To calculate the volume of water from it's mass: 
      \[ V = \frac{W}{d} \]
   b. where:
      \[ V = \text{volume of the water (mL)} \]
      \[ W = \text{weight of the water (grams)} \]
      \[ d = \text{density of water (see Table below)} \]

2. If the results deviate more than the specifications for the equipment, as indicated above, the calibration check has failed. A supervisor is required to take remedial action to investigate and correct the source of the failure.

3. If the diluters or pipettes fall outside the acceptable tolerance range the equipment must be taken out of service. Calibration may be performed by an external calibration service meeting the requirements of ISO IEC/17025:2005 5.6.2.1.1.

END OF DOCUMENT
I. Policy: Below are the procedures that should be followed for the care and maintenance of glassware in the Toxicology Unit. (ISO/IEC 17025:2005 5.5.3, 5.5.5.c, 5.5.5.g, 5.5.6)

A. Volumetric Glassware

1. A serialized volumetric flask new to the laboratory will be calibrated by an ISO 17025 compliant vendor before being used in casework. (ISO IEC/17025:2005 5.6.2.1.1, Supplemental 5.6.1.1)

2. Class A Volumetric Glassware may be used for preparation of solutions without calibration. Volumetric Glassware used for preparation of calibrator (standard) solutions used to create calibration curves shall be calibrated periodically by an external calibration service that is ISO 17025 compliant. Volumetric flasks used for other solutions (QC, internal standards, reagents) do not have to be calibrated.

B. Calibration

1. Volumetric Class A Glassware used for preparation of traceable standard solutions may be calibrated every 5 years by an external calibration service that is ISO 17025 compliant. The certificates obtained will contain the measurement results including the measurement uncertainty and/or statement of compliance with an identified metrological specification (ISO IEC/17025:2005 5.6.2.1.1)

2. The laboratory will maintain copies of the certificates obtained for at least the current five year accreditation cycle.

3. The external calibration service provides information regarding the calibration status, including the last calibration and the recommendation for the next calibration. (ISO/IEC 17025:2005 5.5.8) Due to the size and type of use, it is not possible to label each flask. Labels or reports with the required information should be placed in proximity to the regular storage location of flasks so that it may be inspected by an analyst as needed.

C. Accuracy or Calibration Check (ISO/IEC 17025:2005 5.5.10)

1. Periodic calibration checks are not required for Class A Glassware

2. If there is an indication of an issue with the glassware, the equipment must be taken out of service. Calibration may be performed by an external calibration service meeting the requirements of ISO IEC/17025:2005 5.6.2.1.1

D. Instructions for Use of Volumetric Flasks (ISO/IEC 17025:2005 5.5.3)

1. Volumetric flasks are generally graduated "to contain" (TC) known volumes of solutions and should never be used "to deliver" (TD) known volumes unless they have been so calibrated. Volumetric flasks are used to make up solutions to a given volume.

2. Safety: Volumetric flasks are fragile, and when shaken, should be held at both the neck and bottom. A flask should never be shaken when held at the neck only. When inserting a stopper, hold at the neck rather than at the bottom.

3. Cleanliness: Use a clean flask. It usually does not have to be dry (depending on solvent), but it must be clean. For solutions of organic solvents, the flask can be rinsed with the intended solvent to remove any residual water.

4. Diluting to Volume: Add the solution or solute to be diluted to the flask, and add distilled water or specified solvent to bring to volume. While raising the meniscus to the graduation mark, hold the mark at eye level and add the last few drops from a wash bottle or from a small pipet. Stopper and invert at least three times to assure homogeneity. Where possible, the solution may be mixed by a rotator for 10-15 minutes. Care should be taken that the stopper is secure, or loss of the solution may occur.

5. Reading the Meniscus: In the use of graduated cylinders, pipets, burets, and flasks, the lowest point of the meniscus should be taken as the reading. See below.
a. For opaque liquids, use the center top rim of the liquid surface
b. Reference: NIST, August 2005, "Important Technical Guidance on Glassware"

6. **Handling of Equipment**: Follow the instructions for use.

END OF DOCUMENT
Below are the procedures that should be followed for the care and maintenance of the pH Meter in the Toxicology Unit. (ISO/IEC 17025:2005 5.5.3, 5.5.5.c, 5.5.5.g, 5.5.6)

A. General Information
1. The pH meter must be checked before use to ensure it meets the slope criteria listed below. (ISO/IEC 17025:2005 5.5.10)
   a. The performance check utilizes two solutions to verify the instrument is functioning properly.
   b. The results will be recorded in the pH Log.
2. If the performance check does not meet laboratory criteria or there is an indication of a technical issue, the instrument may be sent out for repair and/or calibration.
   a. Replacement of the probe may be performed by laboratory staff by following manufacturer's instructions.

B. Maintenance:
1. Check the level of the Ag/AgCl Reference Electrode filling solution in the electrode probe. The level should be close to the fill hole at the top of the electrode, not past the fill hole.
2. If additional Ag/AgCl Reference Electrode filling solution needs to be added, remove the rubber stopper and fill the electrode probe to the appropriate level.
3. Refer to the instruction manual for more information about electrode maintenance.
4. The electrode probe should be stored in pH electrode storage solution.
5. Turn OFF the pH meter when not in use, once the pH meter is turned OFF it must be recalibrated before use

C. Accuracy or Calibration Check Instructions using Autoread Function and Instructions for Use:
1. Turn on the pH meter (On/Off button)
2. Press the Mode (enter) button to enter pH measurement mode
3. Choose the two buffers that will be used to calibrate the pH meter; typically two buffers are chosen that bracket the pH reading of interest
4. Remove the rubber stopper on the probe
5. The probe is stored in a storage solution, typically pH electrode storage solution. Remove the probe from the storage solution, rinse the probe with DI water and blot dry
6. Press the Cal button
7. Cal.1 will appear on the screen
8. Choose the higher pH solution to be used for calibration and put a small amount of the solution in a beaker or vial so that it covers the electrode.
9. The meter will automatically read the pH and indicate Ready and the resulting pH when the reading is complete.
10. Press the Cal button
11. Cal.2 will appear on the screen
12. Remove the probe from the higher pH buffer solution and rinse the probe with DI water and blot dry
13. Put a small amount of the lower pH buffer solution to be used for calibration in a beaker or vial so that it covers the electrode
14. The meter will automatically read the pH and indicate Ready and the resulting pH when the reading is complete
15. Press the Mode (enter) button to save and end the calibration
16. The slope will appear on the screen
17. Remove the probe from the solution and rinse the probe with DI water and blot dry
18. Record the slope number in the pH Log along with which levels were used for calibration.
   a. A slope ≥ 95% is acceptable for use.
   b. *See Instruction manual for further information on “Reviewing pH Calibration Slope Data” and electrode maintenance
19. Place the solutions used for calibration in the appropriate chemical waste receptacle, after calibration is complete
20. To measure the sample solution, place the probe in the solution, and press the Measure (Esc) button. The meter will automatically read the pH and indicate Ready and the resulting pH when the reading is complete.
21. Remove the probe from the solution and rinse the probe with DI water and blot dry
22. When the pH meter is not being used, the rubber stopper should be put back in place, and the electrode should be placed in the storage solution.
23. If no further readings are to be done, the pH meter can be turned off

D. Manual Accuracy or Calibration Check Instructions and Instructions for Use:
1. Turn on the pH meter (On/Off button)
2. In measurement mode, press the Setup button
3. Press the Store button until 1.0 is shown on the top line and Conf is shown on the lower line
4. Press Mode (enter)
5. Press the Store or Recall buttons until Cal appears, press Mode (enter)
6. Use the Store or Recall buttons to select MAN for manual calibration
7. Choose the two buffers that will be used to calibrate the pH meter; typically two buffers are chosen that bracket the pH reading of interest
8. Remove the rubber stopper on the probe
9. The probe is stored in a storage solution, typically pH electrode storage solution. Remove the probe from storage solution, rinse the probe with DI water and blot dry
10. Choose the higher pH solution to be used for calibration and put a small amount of the solution in a beaker or vial so that it covers the electrode
11. Press the Cal button
12. Cal.1 will appear on the screen
13. Ready will appear when the reading is complete.
14. Press Store or Recall to set value.
15. Press the Cal button
16. Remove the probe from the solution and rinse the probe with DI water and blot dry
17. Put the lower pH solution to be used for calibration and put a small amount of the solution in a beaker or vial so that it covers the electrode
18. Ready will appear when the reading is complete
19. Press Store or Recall to set value
20. When finished, press Mode (enter) and the slope number will appear on the screen
21. Remove the probe from the solution and rinse the probe with DI water and blot dry
22. Record the slope number in the pH Log along with which levels were used for calibration. See below for slope interpretation
   a. A slope ≥ 95% is acceptable for use.
   b. *See Instruction manual for further information on "Reviewing pH Calibration Slope Data" and electrode maintenance
23. Place the solutions used for calibration in the appropriate chemical waste receptacle, after calibration is completed
24. When the pH meter is not being used, the rubber stopper should be put back in place, and the electrode should be placed in the storage solution.
25. If no further readings are to be done, the pH meter can be turned off

2. User Guide Thermo Scientific Refillable Ag/AgCl pH Electrodes (2007)

F. Handling of Equipment:
1. Follow the instructions for using equipment as recommended by the manufacturer and TOX.17.
Calibration

1. Prepare the pH electrode according to the electrode instructions.
2. Connect the electrodes and ATC probe, if separate, to the meter. Press the key to turn on the meter and press to display pH for pH measurement mode.
3. Select fresh pH buffer. If calibrating more than one point (highly recommended), select pH buffers that bracket the expected sample pH and are at least one pH unit apart.
4. Press to rinse the electrode and ATC probe, if separate, in distilled water, blot dry, and place into the buffer.
   a. With automatic buffer recognition feature, AUTO CAL appears at the top of the display. To calibrate additional points, repeat steps 4 and 5.
   b. With manual calibration (MAN CAL) appears at the top of the display, press or to set value. To calibrate additional points, repeat steps 4 and 5.
6. When finished, press to save and end calibration.
   a. For one-point calibration, press or to edit the slope to match prior calibration if desired and press to save and return to measurement mode.
   b. For two- or three-point calibration, the average slope (SLOPE) will be displayed and the meter will automatically proceed to measurement mode.

Measurement

1. Prepare the pH electrode according to the electrode instructions. Press to display pH for pH measurement mode.
2. Rinse the electrode (and ATC probe, if separate) with 6-still water, blot dry, and place into the sample.
3. If the meter is in AUTO-READ mode (default) press . If the meter is in continuous read mode, the meter will immediately start taking readings. Record the pH and temperature of the sample when "READ" is displayed and "pH" stops blinking.

Notes:
- If AUTO-READ mode and memory storage is enabled, the reading will automatically be stored when the "AR" appears. If in continuous read mode and memory storage is enabled, press to store to store into the meter's memory.
- To continue taking measurements, place electrode (and ATC probe, if separate) into the next sample and repeat steps 2 and 3.
- When finished measuring all samples, store electrode according to electrode instructions.

Reviewing pH Calibration Slope Data

1. In pH measurement mode, press to display pH for pH measurement mode.
2. Press to view slope. If 3-point calibration was done, press to view the second standard segment, and again to display the average slope (SLOPE).
3. Press to return to measurement mode.

pH Calibration Selection

1. In pH measurement mode, press setup.
2. Press twice.
3. Press or to select automatic buffer recognition.
   a. To enter set call for automatic buffer recognition.
   b. To select USA or DIN buffer set for automatic buffer recognition.

Notes:
- USA buffer points are ca.
- DIN buffer points are ca.

4. If automatic buffer recognition was chosen, press to return to measurement mode.

Read Type Selection

1. In measurement mode, press setup.
2. Press or to select "SETUP" on the top line and "READ" is shown on the lower line.
3. Press or or to select the measurement mode:
   a. CONT = Continuous
   b. AUTO = AUTO-READ
   c. STORE = Store mode
   d. SETUP = Setup mode

4. Press to return to measurement mode.

Storing Readings into Memory

This meter stores up to 50 readings. To automatically store readings into memory after each stabilizing reading:
1. In measurement mode, press setup.
2. Press or or or or to select "MEMORY" on the second screen.
3. Press or or to show "FILL" on the second line.

Notes:
- To select the sample to save.
- Press or or to show "CONT" on the second line.

4. Press or or to show "STD" on the second line.
5. Press or or to show "TIME" on the second line.
6. Press or or to return to measurement mode. Each time the reading is locked onto the screen with the "AR" icon, the reading will automatically be stored in the database.

Viewing Stored Readings

1. In measurement mode, press recall.
2. Press or or to scroll through the memory points.
3. Press or or to review the last stored reading at that point.

Keypad Information

- Press to read a measurement.
- Press to enter the calibration.
- Press to return to measurement mode.
- Press to store the reading.
- Press to exit setup mode.
- Press to exit the calibration mode.
- Press to store the reading.
- Press to exit the setup.
- Press to exit the calibration mode.
- Press to return to the measurement mode.
- Press to store the reading.
- Press to exit the setup.
- Press to return to the measurement mode.
- Press to exit the setup.
- Press to return to the measurement mode.
- Press to exit the setup.
- Press to return to the measurement mode.
- Press to exit the setup.
- Press to return to the measurement mode.
- Press to exit the setup.
Electrode Calibration

General Calibration Procedure

For detailed instructions on pH calibration and temperature compensation, consult your meter user guide. When using PhepHion electrodes with a PhepHion pH meter, refer to the PhepHion meter user guide for instructions on temperature calibration and Log pH temperature compensated pH measurements.

One Buffer Calibration

1. Choose a buffer near expected sample pH.
2. The buffer should be at the same temperature as the sample. If the buffer and sample are at varying temperatures, temperature compensation is recommended.
3. Prepare the meter according to the meter user guide.
4. Rinse the electrode first with distilled water and then with the buffer being used for calibration.
5. Place the electrode into the buffer. When the reading is stable, set the meter to the pH value of the buffer at the measured temperature. Refer to the meter user guide for a detailed procedure. Table 1 provides pH values at various temperatures.
6. Proceed to the pH Measurement section.

<table>
<thead>
<tr>

</tr>
<tr>
<td>7.41</td>
</tr>
<tr>
<td>9.18</td>
</tr>
<tr>
<td>10.01</td>
</tr>
</tbody>
</table>

Two Buffer Calibration

This procedure is recommended for precise measurements.

1. Select two buffers that bracket the expected sample pH. The first buffer should be near the electrode's potential point (pH 7) and the second should be near the expected sample pH (pH 4 or pH 10).
2. The buffers should be at the same temperature as the sample; if the buffers and samples are at varying temperatures, temperature compensation is recommended.
3. Rinse the electrode first with distilled water and then with the first buffer.
4. Place the electrode into the first buffer. When the reading is stable, set the meter to the pH value of the buffer at the measured temperature. Refer to the meter user guide for a detailed procedure. Table 1 provides pH values at various temperatures.
5. Rinse the electrode first with distilled water and then with the second buffer.
6. Place the electrode into the second buffer. When the reading is stable, set the meter to the pH value of the buffer at the measured temperature. Refer to the meter user guide for a detailed procedure. Table 1 provides pH values at various temperatures.
7. Proceed to the pH Measurement section.

</tr>
<tr>
<td>10.00</td>
</tr>
</tbody>
</table>
pH Measurement

1. Calibrate the electrode as described in the Electrode Calibration section.
2. Rinse the electrode with distilled water and then with the sample.
3. Place the electrode into the sample.
4. When the reading is stable, record the pH and temperature of the sample.

Electrode Storage

To maintain a quick response and free-flowing junction, the sensing element and reference junction must not dry out.

Short-term Storage (up to one week)

Wash the electrode in pH electrode storage solution, Cat. No. 510691. To prevent crystallization of the fill solution, cover the fill hole whenever the electrode is being stored and open the fill hole when calibrating and measuring.

Long-term Storage (more than one week)

Fill the reference chamber and securely cover the filling holes. Cover the sensing element and reference junction with the protective cap/lid/wrap containing a few drops of storage solution. Before removing the electrode to use, prepare it as a new electrode.

Electrode Maintenance

1. Inspect the electrode for scratches, cracks, pitting, crystal buildup, or membrane/junction deposits.
2. Rinse off any salt buildup with distilled water. Remove any membrane/junction deposits as directed in the General Cleaning section.
3. Drain the reference chamber, flush it with fresh filling solution and refill the chamber with fresh filling solution.

Chapter 7 Appendix

Automatic pH Buffer Recognition Feature

The Orion Star S11 benchtop pH and Star A22 portable pH meters are capable of automatic buffer recognition. pH 1.88, 4.01, 7.00, 10.01, and 12.46 buffers or pH 1.84, 4.01, 6.84, and 9.18 buffers may be used during a pH calibration, depending on the pH buffer set that is selected in the setup menu. During a calibration, the meter uses the selected buffer set and the pH reading of the pH electrode in the buffer is recognized and displayed. The pH reading of the pH electrode in the buffer must be about ±0.05 pH away from the theoretical pH reading of the buffer in order for the meter to automatically recognize the buffer.

Electrode Cleaning Procedures

General Cleaning

1. Clean the electrode in 0.1 M HCl or HNO₃ for half an hour.
   The electrode can also be cleaned for 15 minutes in a 1:10 dilution of household bleach or a 0.1 to 0.5% liquid detergent solution mixed with hot water. The solution should be stirred at a moderate to fast pace.
2. Drain the reference chamber and refill it with fresh filling solution.
3. Soak the electrode in pH electrode storage solution for at least one hour.

Cleaning Solutions

Cat. No. 900021—pH cleaning solution A for removing protein contaminants.
Cat. No. 900022—pH cleaning solution B for removing bacterial contaminants.
Cat. No. 900023—pH cleaning solution C for general cleaning.
Cat. No. 900024—pH cleaning solution D for removing oil and greasy contaminants.
Cat. No. 900020—pH cleaning solution kit, includes cleaning solutions A, B, C, and D.
Electrode Condition Icon

The electrode condition icon indicates the performance of the pH electrode, based on the last saved calibration and electrode measurement stability.

<table>
